PREFACE.

THE arrangement of this *Year Book* differs in some details from that of No. 7. To enable details more subject to change to be incorporated up to as late a date as possible, the information on Population and Vital Statistics has been transferred to Chapters XXIV and XXV, while certain other items have been culled from various chapters and incorporated in Chapter XXVIII. While this is, perhaps, a less logical arrangement than that followed before, it is certainly more useful. On the other hand, the short chapter on the Electorate, which appeared as Chapter XII in *Year Book* No. 7, has been incorporated in the chapter on Constitution and Government (Chapter II), where it more properly belongs.

By Act No. 8 of 1925 the Parliament of the Union recognized Afrikaans (in conjuction with Nederlands) as one of the official languages of the Union. Arrangements have accordingly been made to translate the whole of the *Year Book*, which formerly appeared in Nederlands, into Afrikaans. The translation of eleven hundred pages of matter which includes a great deal of widely divergent technical information, in a relatively short time, is a work of no small labour. The credit for the completion of this task is shared by Mr. A. C. Floor, translator of this office, and Professor Jan. F. E. Celliers, the well-known South African poet. It is hoped that the availability of the book in the form of Dutch which is universally spoken in South Africa will lead to a wider circulation in rural areas.

Further to signalize the passage of this Act, which is one of not inconsiderable national importance, there appears in this issue an article by Professor J. J. Smith on the "Evolution and Recognition of the Afrikaans Language." Professor Smith is Professor of Afrikaans in the University of Stellenbosch and editor of *Die Afrikaanse Woordeboek*, now in preparation. He is excellently qualified to deal authoritatively with this subject, and his article gives, in short compass, an account of an important development about which a great deal of ignorance still prevails, especially among English-speaking South Africans. The article appears on page 14 *et seq.*

I have great pleasure in placing on record my appreciation of the assistance rendered by Government Departments, private organizations, and individuals in keeping the *Year Book* up to date. I am particularly grateful to those who have drawn my attention to inaccuracies and omissions in regard to matters on which they can speak with authority.

Considerations of space make it necessary in each *Year Book* to leave out special articles which have appeared in previous editions. To enable these to be traced more easily they have been included in the index to this volume.

J. E. HOLLOWAY,
Director of Census and Statistics.

UNION OFFICE OF CENSUS AND STATISTICS,

CORRIGENDA.

Page 353, paragraph 10 (ii) (*b*), fourth line, for "mortgager" read "mortgagor."

Page 365, Valuation of Immovable Property, etc., Total Valuation, Maclear; for "937,643" read "937,463";
Total, for "10,241,245" read "10,241,065."

Page 433, paragraph 5, eighteenth line, for "transplated" read "transplanted."

Page 526, Coal—Union Imports, etc., Railway, 1923, for "2,147,042" read "2,644,544"; 1924, for "2,518,854" read "2,780,944."

STATISTICAL SUMMARY OF UNION PROGRESS, 1891 TO 1924.

NOTE.—The table below is intended to provide a ready synopsis of South African progress in various directions during the period stated, and it has therefore been deemed advisable to exclude therefrom all but the most essential explanations of the figures given. Fuller particulars regarding the different items will be obtained on reference to the relative sections of this *Year Book*.

DETAILED TABLE OF CONTENTS.

PART I.—UNION OF SOUTH AFRICA.

INTRODUCTORY.—STATISTICAL SERVICE AND SOURCES OF INFORMATION.

PAGE

§1. Statistical Service of the Union.
1. Statistical Information prior to the Constitution of the Union..... 1
2. Statistical Service subsequent to the Constitution of the Union..... 1
3. Organization of Statistical Collection. 2

§ 2. Archives and Records.
1. Archives..... 5
2. The Earliest Records of South Africa up to the First British Occupation, 1652–1795..... 5
3. Records of the Cape of Good Hope during the First British Occupation, 1795–1803..... 5
4. Records of the Cape of Good Hope during the days of the Batavian Republic, 1803–1806..... 5

§ 3. Bibliography of the Union of South Africa.
1. Government Reports..... 6
2. Works of Reference and Periodicals 9
3. General Works..... 10

CHAPTER I.—HISTORY AND DESCRIPTION.

§ 1. Discovery, Colonization, and Development of South Africa..... 11

§ 2. The Early Expansion of the Cape Colony, with special Reference to the Migration of the Farming Community.
1. Early Agriculturists..... 11
2. Migration of Farmers..... 11
3. References..... 12

§ 3. Colonial Dutch Architecture..... 12

§ 4. The Evolution and Recognition of the Afrikaans Language..... 14

§ 5. Honours Held in Connexion with the Union..... 23

§ 6. The Capital Cities of the Union..... 23

§ 7. Geological Structure of the Union.
A. Physical Features—
1. The High Veld..... 24
2. The Basuto Highlands..... 24
3. The Upper Karroo..... 25
4. The Namaqua Highlands..... 25
5. The Kalahari and Bushmanland... 25
6. The Kaap Plateau..... 25
7. The Middle Veld..... 25
8. The Bushveld..... 26
9. The Limpopo Highlands..... 26
10. The Low Country..... 26
11. The Great Karroo..... 27
12. The South-eastern Region..... 27
13. The Folded Belt..... 27
14. The Coast Belt..... 28
B. Geology..... 29
C. Geological Structure..... 37
D. Systems of Geological Formation.... 39
E. Earthquakes and Earth Tremors in the Union..... 41
F. A Survey of the Medicinal Springs of South Africa—
1. General..... 41
2. Classification..... 43
3. Description of Individual South African Springs..... 43
4. Natural Table Waters..... 46
5. Conclusion..... 46

§ 8. Area of the Union.
1. Area..... 46
2. Comparison with other Countries..... 47

§ 9. The Plant Geography of South Africa... 47

§10. Economic Plants of South Africa.
1. General..... 47
2. Classification of Economic Plants.... 48

§11. Fauna.
1. General..... 53
2. Game Preservation..... 53
3. Some of the Rarer Game Animals of South Africa and the need for their Protection..... 55

§12. Climate and Meteorology.
1. Historical Sketch of Meteorological Development in the Union..... 56
2. Meteorological Organization of the Union..... 60
3. General..... 60
4. Temperature..... 61
5. Hottest and Coldest Months..... 61
6. Mean Diurnal Range..... 61
7. Extremes of Temperature..... 62
8. Frosts..... 62
9. Shade Temperatures of 32° F. and Under..... 62
10. Rainfall..... 63
11. Thunderstorms..... 64
12. Intensity of Rainfall..... 72
13. Hail..... 72
14. Hailstorm at Pretoria and Vicinity, 25th December, 1923..... 73
15. Snow..... 74
16. Winds and Wind Velocities..... 74
17. Hot Winds..... 74
18. Duststorms..... 75
19. Evaporation..... 75
20. Sunshine..... 75
21. Upper Air Research in South Africa. 76

§13. Observatories.
A. The Union Observatory—
1. Institution and Development..... 76
2. Instruments..... 77
3. General Operations..... 78
4. Visitors..... 78
B. Royal Observatory..... 78
C. The Yale Telescope..... 79
D. Variation of the Magnetic Compass over South Africa..... 80

CHAPTER II.—CONSTITUTION AND GOVERNMENT.

PAGE

§ 1. Early Governmental and Judicial Administration..... 81

§ 2. Constitutional Development.
1. General..... 81
2. The Union of South Africa..... 81

§ 3. Central Administration.
1. General..... 89
2. The Governor-General..... 89
3. Ministries of the Union..... 90
4. Departments of State and Ministers 90

§ 7. South Africa and the League of Nations.
1. South Africa's Connexion with the League..... 115
2. Contribution of South Africa to the League..... 115

§ 8. Electorate.
1. Qualifications of Parliamentary Voters 116
2. Elections..... 117
3. Registered Voters in Electoral Divisions..... 118
4. Parliamentary Representatives and Number of Registered Voters..... 121
5. By-Elections..... 122
6. Electoral System for Provincial Councils..... 122
7. Provincial Council Representatives and Number of Registered Voters 123
8. Provincial Council By-Elections..... 123

CHAPTER III.—LOCAL GOVERNMENT.

§ 1. Powers and Duties of Local Governing Bodies.
1. Cape of Good Hope..... 125
2. Natal..... 125
3. Transvaal..... 126
4. Orange Free State..... 126

§ 2. Municipal Rating..... 127

§ 3. History and Development of Four of the Principal Towns.
1. Johannesburg..... 129
2. Kimberley..... 130
3. Port Elizabeth..... 131
4. East London..... 132

§ 4. Local Governing Bodies.
1. Municipalities..... 132
2. Other Local Governing Bodies..... 136
3. Statistics..... 137

§ 5. Statistics of Principal Municipalities.
1. City of Capetown..... 144
2. Borough of Durban..... 147
3. Municipality of Johannesburg..... 152
4. Municipality of Pretoria..... 156
5. Other Large Municipalities..... 160

CHAPTER IV.—EDUCATION.

1. Higher Education.
1. History and Development of Higher Education in South Africa..... 162
2. University of South Africa..... 162
3. University of Capetown..... 164
4. University of Stellenbosch..... 164
5. University of Witwatersrand..... 165
6. Statistics of Teaching Universities and University Colleges..... 165
7. Examinations under the New University Organization..... 167
8. Financial Statistics: Higher Education..... 168
9. Extension Facilities at University Institutions..... 170

§ 2. State and State-aided Education other than Higher Education.
1. General..... 170
2. Administrative System..... 171
3. Finance..... 171
4. Classification and Curriculum of Schools..... 171
5. Religious Instruction..... 172
6. Attendance..... 172
7. Qualifications and Grading of Teachers 172
8. Salaries of Teachers..... 174
9. Training Colleges..... 174
10. Special and Part-time Schools..... 175
11. Vocational Education..... 175

§ 3. Statistics of State and State-aided Education other than Higher Education.
1. General..... 175
2. Statistics as to Education of European Scholars..... 178
3. Expenditure on Education of European Scholars..... 184
4. Statistics of Education of European Scholars in certain Urban Areas.... 185
5. Statistics as to Education of Non-European Scholars..... 186

§ 4. Statistics of Private Schools..... 189

§ 5. Medical Inspection of Schools..... 193

§ 6. Intelligence Tests..... 198

§ 7. Scientific Research in the Union..... 198

§ 8. Miscellaneous.
1. Public Libraries..... 198
2. Art Galleries..... 200
3. Museums..... 201
4. Zoological Gardens..... 202
5. Botanic Gardens..... 202
6. Registered Newspapers..... 203
7. Scientific and Cultural Societies..... 204

CHAPTER V.—LABOUR AND INDUSTRIAL CONDITIONS.

PAGE

§ 1. Union Department of Labour.
1. Formation of Department of Labour. 205
2. Functions of Department of Labour.. 205
3. Advisory Council of Labour..... 205
4. The *Social and Industrial Review*..... 206

§ 2. Labour Conditions, Unemployment, and Relief Works.
1. General Conditions of Labour in the Union..... 206
2. Occupations of Union Population.... 206
3. Government Employment Exchanges 207
4. Private Registry Offices..... 209
5. Unemployment Relief Work..... 209
6. Government Relief Workers..... 209
7. Municipal Relief Works..... 210
8. Afforestation Settlements..... 210
9. Rural Unemployment and Rehabilitation of Rural Poor..... 210
10. Training Farms and Land Settlements 210
11. Tenant-Farmer System..... 211

§ 3. Conciliation Boards, Industrial Councils, Trade Unions, Employers' Organizations, etc.
1. Industrial Conciliation Act..... 211
2. Effects of Industrial Conciliation Act 212
3. Trade Unions Registered under Industrial Conciliation Act..... 213

4. Record of Beneficiaries..... 244
5. Revenue and Expenditure under Phthisis Acts..... 246

§10. Recent Phthisis Legislation.
1. The Miners' Phthisis Act Amendment Act, No. 35 of 1924..... 247
2. Miners' Phthisis Acts Consolidation Act, No. 35 of 1925..... 248
3. Phthisis Acts, 1919 and 1925..... 251

CHAPTER VI.—PRICES AND VARIATIONS IN THE COST OF LIVING.

§ 1. Introductory.
1. General..... 254
2. Statistics of Prices and Cost of Living 254
3. What is an Index Number?..... 255

§ 2. Wholesale Prices.
1. System of Collection..... 255
2. Price Indexes and Prices..... 255

§ 3. Retail Prices.
1. System of Collection..... 256
2. Price Indexes..... 257

§ 4. Housing and Rents.
1. Rent Legislation..... 261
2. Housing Loans Funds..... 261
3. Building Plans Passed in Urban Areas 262
4. Censuses of Rents..... 263
5. Rent Returns at Population Censuses 265

§ 5. Cost of Living.
1. General..... 266
2. Comparison of Retail Prices in certain Countries..... 268
3. Price Fluctuations in the United Kingdom and the Union..... 268
4. Purchasing Power of a Sovereign in the United Kingdom and the Dominions..... 269
5. Prices of Wheat, Flour, and Bread in Different Countries..... 270
6. "Sundries"..... 271
7. Profiteering Act, 1920..... 271

CHAPTER VII.—PUBLIC HEALTH AND HOSPITALS.

§ 1. Public Health.
1. Public Health—History and Development..... 272
2. Plague..... 272
3. Typhus Fever..... 273
4. Public Health and Sanitation, etc... 273
5. Habit-forming Drugs..... 274
6. Notifiable Infectious Diseases..... 274
7. Local Health Authorities..... 275
8. District Surgeons..... 275
9. Port Health Work..... 275
10. Inspection and Prevention of Adulteration of Food and Drugs..... 275
11. International Health Organization and South African Health Intelligence System..... 275

§ 2. General Hospitals.
1. Cape of Good Hope Hospitals..... 276
2. Natal Hospitals..... 276
3. Transvaal Hospitals..... 277
4. Orange Free State Hospitals..... 278

§ 3. Mentally Disordered or Defective Persons.
1. Legislation..... 278
2. Mental Hospitals..... 279
3. Institutions for Feeble-minded Persons 279
4. Single Patients..... 279
5. Licensed Institutions..... 279
6. Mentally Defective Children in Schools 279
7. Patients and Staff (Mental Hospitals and Institutions)..... 280
8. Mentally Disordered and Defective Persons..... 281

PAGE

§ 4. Venereal Diseases Hospitals.
Institutions, Patients, and Expenditure..... 282

§ 5. Lepers.
1. Legislation..... 283
2. Leper Institutions..... 283

§ 6. Registration of Medical Practitioners, Dentists, Nurses, and Chemists and Druggists.
1. Legislation..... 285
2. Number of Registrations..... 285

CHAPTER VIII.—SOCIAL CONDITION.

§ 1. Ecclesiastical.
1. General..... 286
2. The Dutch Reformed Church (Nederduits Gereformeerde Kerk)..... 286
3. The Reformed Church of South Africa (Die Gereformeerde Kerk)..... 287
4. Die Nederduits Hervormde Kerk..... 288
5. English Church..... 288
6. Wesleyan Methodist Church of South Africa..... 289
7. Presbyterian Church of South Africa.. 290
8. Roman Catholic Church..... 292
9. Congregational Churches..... 293
10. The Jewish Community..... 293

§ 2. Benevolent Institutions and Organizations.
1. General..... 294
2. Government Expenditure on Poor Relief..... 294
3. Charitable Institutions..... 295
4. Benevolent Institutions in Cape Peninsula and Johannesburg..... 298
5. The Governor-General's Fund..... 298
6. The Administrator's (Transvaal) Distress Fund..... 298
7. South African Prisoners' Aid Association..... 298
8. Friendly Societies..... 300

§ 3. Organization and Legislation in Promotion of Child Welfare.
1. Child Welfare Organizations..... 301
2. Children's Protection Act..... 304
3. Adoption of Children Act..... 304
4. Other Legislation..... 305

§ 4. Liquor Laws.
1. General..... 305
2. Temperance Movement..... 307

§ 5. Divorces.
Return of Divorces..... 307

§ 6. Miscellaneous.
1. Natural and Historical Monuments... 309
2. Prevention of Cruelty to Animals..... 309
3. Public Holidays..... 309

CHAPTER IX.—ADMINISTRATION OF JUSTICE.

§ 1. Criminal Jurisdiction—Lower Courts.
1. Magistrates' Courts..... 310
2. Courts of Special Justice of the Peace 310
3. Courts of Native Commissioners and Sub-Commissioners..... 311

§ 2. Criminal Jurisdiction—Superior Courts.
1. Division of the Supreme Court..... 312
2. Jurisdiction..... 312
3. Jurisdiction under Act No. 31 of 1917 313
4. Appellate Jurisdiction..... 313
5. Advocates, Attorneys, etc..... 314

§ 3. Civil Jurisdiction—Lower Courts.
1. Magistrates' Courts..... 315
2. Courts of Special Justice of the Peace 316
3. Courts of Native Commissioners..... 316
4. Record of Civil Cases, Inferior Courts 316

§ 4. Civil Jurisdiction—Superior Courts.
1. Provincial and Local Divisions..... 316
2. Appellate Division..... 317

§ 5. Source, Development, and Nature of the Law of South Africa..... 318

§ 6. Union Department of Justice.
1. Constitution of Department..... 318
2. Judges and Staff of the Supreme Court 319
3. Sheriffs..... 320

§ 7. Statistics of Crime.
1. General..... 320
2. Serious Crime..... 322
3. Analysis of Statistics of Crime, 1924.. 325

§ 8. Prisons.
1. Prison System..... 328
2. Prison Labour..... 328
3. Penal Legislation..... 329
4. Training and Instruction..... 329
5. The Indeterminate Sentence: Nature and Working..... 329
6. Statistics..... 330
7. Administration of Prisons..... 333

§ 9. Miscellaneous.
1. Trial of Children and Juveniles..... 333
2. Punishments for Juvenile Crime..... 334
3. Suspended Sentences..... 334
4. Probation Officers..... 335

CHAPTER X.—POLICE AND PROTECTION.

PAGE

§ 1. Development of the Union Police Organization.

1. Organization of the Police Force before 1910 ... 336
2. Organization of the Police Force after 1910 ... 336
3. Number of Police in Provinces and Divisions ... 336
4. Duties of the Police ... 337
5. Recruiting and Losses ... 338
6. Scales of Pay ... 338

§ 2. Defence System of the Union.

1. General ... 339
2. Administration ... 339
3. Military Districts ... 339
4. The South African Permanent Force. 339
5. The South African Military College.. 339
6. The Coast Garrison Force ... 339
7. The Citizen Force ... 340
8. Registration ... 340
9. The Active Citizen Force ... 340
10. South African Naval Service ... 341
11. Naval Dockyards (Simonstown) ... 341
12. South African Air Force ... 341
13. The Citizen Force Reserve ... 341
14. The Coast Garrison Force Reserve.. 341
15. The National Reserve ... 341
16. Rifle Associations ... 341
17. Cadets ... 342
18. Commission of Inquiry ... 342

§ 3. Miscellaneous.

1. South Africa and the European War 342
2. Custodian of Enemy Property ... 343

CHAPTER XI.—LAND SURVEY, TENURE, AND OCCUPATION.

§ 1. Land Survey.

1. Legislation ... 344
2. Triangulation ... 344
3. Government Supervision of Survey... 345
4. Scale of Fees ... 346

§ 2. Tenure and Occupation of Crown Lands.

1. Land Laws of the Union ... 346
2. Land Settlement Acts ... 347
3. Advances to Lessees ... 348
4. Advances to Lessees of Town Lands and Commonages ... 348
5. Statistics: Results of Working of the Land Settlement Act ... 348
6. Other Laws of the Union ... 349
7. Cape of Good Hope Province ... 349
8. Natal Province ... 350
9. Transvaal Province ... 351
10. Orange Free State Province ... 353
11. Method of Application for Vacant Crown Lands (Unadvertised) ... 353
12. Advertised Crown Lands open for Application ... 354
13. Method of Purchase ... 354
14. Advances ... 354
15. Financial ... 354
16. General Statistics ... 355
17. Boreholes and Windmills ... 355

§ 3. Registration of Deeds.

1. Deeds Registries in the Cape of Good Hope ... 355
2. Deeds Registry in Natal ... 359
3. Deeds Registry in Transvaal ... 360
4. Deeds Registry in Orange Free State 363
5. Scale of Fees ... 364

§ 4. Valuation of Property—Cape of Good Hope.

First Quinquennial Valuation ... 364

CHAPTER XII.—IRRIGATION AND WATER CONSERVATION.

§ 1. Irrigation.

1. Legislation ... 368
2. Administration ... 369
3. Government Expenditure on Irrigation 370
4. Water-boring ... 371
5. Irrigation Districts ... 372
6. Important Irrigation Schemes ... 374

§ 2. Conservation of Water.

1. Waterworks and Storage in Municipal Areas ... 376
2. City of Cape Town Waterworks ... 376
3. Rand Water Board ... 377

CHAPTER XIII.—AGRICULTURAL AND PASTORAL PRODUCTION.

§ 1. General.

1. Statistics of Production ... 380
2. Union Department of Agriculture: Organization ... 382
3. Revenue and Expenditure ... 382
4. Veterinary Education and Research.. 383
5. Field and Animal Husbandry ... 384
6. Division of Botany ... 384
7. Division of Entomology ... 384
8. Locust Administration ... 386
9. Division of Chemistry ... 386
10. Division of Extension ... 390
11. Division of Agricultural Economics, Markets, and Co-operation ... 390
12. Grading of Agricultural Products ... 392
13. Agricultural Organization in the Union 392
14. Legislation ... 393

§ 2. Live Stock and Pastoral Production.

1. Horses, Mules, and Asses ... 394
2. Cattle ... 396
3. The Beef Industry in South Africa.. 397
4. Dairying ... 400
5. Sheep and Wool ... 404
6. Goats and Mohair ... 407
7. Pig and Bacon Industry ... 409
8. Ostrich Farming ... 411
9. Poultry ... 412
10. Bees ... 413
11. Losses of Stock from Drought and Disease ... 414
12. Transportation of Live Stock ... 415

§ 3. Cereals.

A. General—

1. Cultivation of Cereals ... 416
2. Wheat ... 416
3. Oats ... 418
4. Rye ... 419
5. Barley ... 420
6. Maize ... 420
7. The Sorghums ... 423

B. Survey of Economics of Maize Production—

8. Importance of Maize Production in the Union ... 424
9. Production and Export of Maize ... 424
10. Grain Elevators ... 424
11. Grading of Maize ... 426
12. Maize Yield and Elevator Operations, 1925 ... 426

PAGE

§ 4. Fodder Crops and Ensilage.
1. General Statistics..... 431
2. Lucerne and other Forage Crops..... 431
3. Teff..... 432
4. Agricultural Grasses..... 433
5. Spineless Cactus..... 433
6. Chicory..... 434
7. The Millets..... 434
8. Silage..... 434

§ 5. General Agricultural Crops (Non-Cereals).
1. Miscellaneous..... 435
2. The Potato..... 436
3. Beans..... 437
4. Peanuts..... 438

§ 6. Vineyards and Fruit Cultivation.
1. Viticulture..... 439
2. Fruit Cultivation..... 443
3. Fruit Export Control Act, 1925..... 448
4. Inquiry into Fruit Export Trade..... 448
5. Precooling Chambers, Cape Town Docks..... 449

§ 7. Sugar-Cane.
1. Sugar Industry..... 450
2. Statistics..... 452
3. Special Census of Sugar-cane Plantations..... 452

§ 8. Tea, Cotton, and Tobacco.
1. Tea..... 453
2. Cotton..... 454
3. Tobacco..... 455

PAGE

§ 9. Valuation of Agricultural and Pastoral Production and Prices of Farm Products.
1. Valuation..... 456
2. Market Prices of Farm Products..... 456

§ 10. Farms, Farm Labour, and Agricultural Implements.
1. Number, Tenure, and Area of Farms.. 457
2. Employees on Farms..... 458
3. Agricultural Implements, Machinery, etc..... 458

§ 11. Fertilizers.
1. General..... 458
2. Guano..... 459

§ 12. Agricultural Co-operation..... 459

§ 13. Agricultural Schools and Experiment Farms.
1. Description of Establishments..... 460
2. General Particulars..... 461
3. Courses..... 461
4. Extension Work..... 461
5. Demonstration Train..... 462
6. Experiment Work..... 462
7. Laboratory Research..... 462
8. Scholarships..... 463
9. Household Science..... 463
10. Other Facilities..... 463
11. Sales of Stock..... 463
12. Expenditure and Revenue..... 463

CHAPTER XIV.—FORESTS.

§ 1. Character and Extent of South African Forests.
1. General..... 464
2. Scrub Forests..... 464
3. Timber Forests..... 464
4. Extent of Plantations and Indigenous Forests..... 465
5. Regeneration and Growth of the Timber Forests..... 466
6. Reserved Indigenous Trees..... 466

§ 2. Forestry Development.
1. Relation of the State to Forestry..... 468
2. Policy of the Forest Department..... 468
3. Organization of the Forest Department 469
4. Revenue and Expenditure of Forest Department..... 470

§ 3. Forest Products.
1. Imports of Unmanufactured Timber.. 471
2. Yield from South African Forests, etc. 472
3. Minor Forest Industries..... 472

CHAPTER XV.—FISHERIES.

§ 1. The Fishing Industry of the Cape of Good Hope.
1. History of the Industry..... 475
2. Later Development..... 475
3. Cape Fishing Pursuits..... 476
4. Fish Varieties..... 476
5. Whales..... 477
6. River and Enclosed Water Fisheries. 477
7. Statistics..... 477

§ 2. The Fishing Industry of Natal.
1. Early Legislation..... 478
2. Later Legislative Provision..... 478
3. Natal Fisheries Department..... 479
4. Commissions and Boards..... 479
5. Fish Varieties..... 479
6. Trout and Fresh Water Angling..... 480
7. Revenue and Expenditure..... 480
8. Whaling Industry..... 480
9. Further Statistics..... 481

§ 3. Fisheries Committee..... 482

§ 4. Inland Fisheries Survey..... 482

CHAPTER XVI.—MINES.

§ 1. Organization of Mines Department..... 483

§ 2. Statistics of Mineral Production.
1. Value of Mineral Production..... 484
2. Details of Mineral Production..... 484
3. Wages Earned in Mining..... 487
4. Average Pay per Shift..... 489
5. Labour on Mines, etc..... 489
6. Nationality of Mine Employees..... 490
7. Accidents and Death-rates on Mines. 490
8. Stores Consumed by Mines..... 491
9. Capital Issued by Mines..... 491
10. Mine Dividends Declared..... 492

§ 3. Gold.
1. Bibliography..... 492
2. Gold and Diamonds..... 492
3. Historical..... 492
4. Witwatersrand Gold Mining..... 493
5. Gold Production..... 494
6. Methods of Mining..... 495
7. Metallurgy of Gold Production..... 495
8. Barberton Goldfield..... 496
9. Pietersburg and Murchison Range..... 496
10. Lydenburg and Pilgrims Rest..... 496
11. Alluvial Gold..... 496
12. Future Production..... 497
13. Mining Commissions..... 498
14. Capital in Gold Mining Industry..... 501
15. Costs and Yield of Gold Mining (Witwatersrand)..... 503
16. Prices and Disposal of South African Gold..... 503
17. The System of Leasing of Gold Areas 506
18. Rand Refinery, Limited..... 508

PAGE

§ 4. Copper.
1. General... 508
2. Discovery of Copper and Development of Mining... 508
3. Production of Copper... 509
4. Ore Deposits and Methods of Mining and Treatment... 509

§ 5. Tin.
1. Discovery and Mining of Tin... 510
2. Production of Tin... 511

§ 6. Other Metals.
1. General... 511
2. Antimony... 511
3. Arsenic... 512
4. Asbestos... 512
5. Borium... 512
6. Bismuth... 512
7. Chromium... 512
8. Cobalt... 512
9. Iron... 512
10. Lead... 513
11. Mercury... 513
12. Manganese... 514
13. Molybdenum... 514
14. Nickel... 514
15. Platinum, etc... 514
16. Silver... 515
17. Thorium... 515
18. Titanium... 515
19. Tungsten... 515
20. Vanadium... 515
21. Zinc... 515
22. Radio-Active Minerals... 515
23. Graphite, Corundum, Mica... 515

§ 7. Diamonds.
1. Discovery of Diamonds... 516
2. Production of Diamonds... 516
3. Geology... 517
4. Economics of Diamond Production... 517
5. Prices of Diamonds... 518
6. Costs of Diamond Mining... 518
7. Labour in Diamond Mines... 518
8. Alluvial Diamonds... 518
9. General... 519
10. Diamond Cutting... 519

§ 8. Gem Stones other than Diamonds.
1. Garnets... 520
2. Verdite... 520
3. Crocidolite... 520
4. Jade... 520

§ 9. Coal.
1. Coal... 520
2. Production of Coal in Union... 520
3. Geology and Occurrences... 521
4. Methods of Mining... 523
5. Coke, By-Products, Tar, etc... 523
6. Employment and Accidents in Coal Mining... 524
7. Labour in Union Collieries... 524
8. Wages (Coal Mines)... 524
9. Capital (Coal Mines)... 525
10. International Comparison of Production... 525
11. Union Coal Trade and Coal Consumption... 525
12. Price of Coal... 526
13. International Comparison of Prices... 527
14. Coal Commission and Coal Act... 527
15. Grading of Coal... 528

§ 10. Non-Metallic Minerals other than Coal.
General... 528

§ 11. State Aid to Mining... 535

§ 12. Mineral Laws of the Union... 535

§ 13. Bibliography of Mineral Resources... 535

CHAPTER XVII.—MANUFACTURING INDUSTRIES.

§ 1. Industrial Censuses.
1. Industrial Censuses, 1891–1911... 537
2. Annual Industrial Censuses under the Statistics Act... 537
3. Classification of Manufacturing Industries... 537
4. Statistics of Manufacturing Production from 1904... 538

§ 2. Factory Production.
1. Number of Factories... 539
2. Dates of Establishment of Factories... 540
3. Capital of Factories... 541
4. Land and Buildings (Factories)... 541
5. Machinery and Plant in Factories... 542
6. Motive Power in Factories... 542
7. Cost of Fuel, Light, and Power in Factories... 543
8. Factory Employees... 544
9. Wages Paid in Factories... 546
10. Value of Materials used in Factories... 548
11. Gross Value of Factory Production... 549
12. Value Added in Process of Manufacture... 550
13. International Comparison of Factory Returns... 550
14. Monthly Index of Industrial Activity 551

§ 3. Individual Industries.
1. Principal Manufacturing Industries... 551
2. Materials Used and Articles Produced 556
3. Railway Workshops... 569

§ 4. Board of Trade and Industries.
1. Division of Industries... 570
2. Advisory Boards... 570
3. Publications of Industries Division... 570
4. Board of Trade and Industries... 572

§ 5. Miscellaneous.
1. Iron and Steel Industry Encouragement Act, 1922... 574
2. Electricity Act, 1922... 575

CHAPTER XVIII.—COMMERCE.

§ 1. Customs Unions and Conventions.
1. Customs Union Conventions... 576
2. Transvaal-Mozambique Convention... 576
3. East African Trade Delegation... 577
4. Madagascar Trade Conference... 577

§ 2. Union Customs Management and Tariff.
1. Customs Management... 577
2. Statistics of External Trade... 579
3. Preference... 579
4. Protection... 580
5. Customs Tariff... 581

§ 3. Trade Commissioner Services.
1. Trade Commissioner of the Union in London... 609
2. Commissioner of Commerce for the Union (Milan)... 610
3. Trade Commissioner for the Union in East Africa... 610
4. Trade Commissioner for the Union in America... 610
5. H.M. Trade Commissioner in South Africa... 610
6. American Trade Commissioner in South Africa... 611
7. Canadian Trade Commissioner in South Africa... 611
8. Trade Commissioner for Madagascar... 612
9. General... 612

PAGE

§ 4. Imports and Exports.
1. South African Oversea Trade, 1826–1909 ... 612
2. Imports and Exports from 1906 ... 612
3. Imports into the Union ... 613
4. Exports from the Union ... 617
5. Foreign Trade ... 623
6. Analysis of Trade with other Countries ... 626
7. Trade Routes through Union Ports ... 639
8. Movements of Specie ... 641

§ 5. General Features of the External Trade of the Union.
1. General Conditions of Trade ... 642
2. Vessels Entered at Union Ports ... 643
3. Decreases in Imports of Various Foodstuffs ... 643
4. Exports of Staple Commodities in 1924 644
5. Principal Exports since 1909 ... 644
6. Variation of Export Values ... 648
7. Variation of Import Values ... 651
8. Exports and Imports per Head of European Population ... 653
9. Trade with Neighbouring Countries ... 655
10. Supplies for Ships ... 655
11. Insurance and Freight Charges ... 655

§ 6. Excise Duties.
Excise Duties Imposed in the Union ... 656

§ 7. Patents, Designs, Trade Marks, and Copyright.
1. General ... 657
2. Patents ... 658
3. Designs ... 659
4. Trade Marks ... 659
5. Copyright ... 659
6. Return of Applications and Registration of Patents, etc ... 659

§ 8. Trading Licences.
1. Description and Scale of Licences ... 661
2. Licences Issued ... 668

§ 9. Stamp Duties and Fees ... 675

§ 10. Weights and Measures.
1. Weights and Measures Act ... 679
2. Weights and Measures Used in Connexion with Agricultural Production 680
3. Assizing Fees ... 680

CHAPTER XIX.—HARBOURS AND SHIPPING.

§ 1. Harbours.
1. General ... 682
2. Harbour Advisory Boards ... 682
3. Capital Expenditure on Harbours ... 682
4. Revenue and Expenditure of Harbours 683
5. Government-owned Steamers ... 683
6. Staff of Harbour Department ... 684
7. Berthing Facilities ... 684
8. Lighthouses, etc ... 692

§ 2. Shipping.
1. Shipping from 1910 ... 693
2. Passengers and Cargo ... 695
3. Coal Bunkered and Exported ... 696
4. Register of Shipping ... 697

CHAPTER XX.—RAILWAYS AND LAND TRANSPORTATION.

§ 1. Railway Development in South Africa.
1. General ... 698
2. Comparison with other Dominions ... 698
3. Railway Construction Acts, 1922, 1924, and 1925 ... 698
4. Electrification of Railways ... 699

§ 2. Gauge of Railways.
1. General ... 700

§ 3. Construction and Open Mileage.
1. Open Mileage ... 701
2. Mileage of Government Railways ... 701
3. Mileage of Government and Private Railways ... 702
4. Main and Branch Railways ... 703
5. Mileage according to Area and Population ... 703

§ 4. Administration of Government Railways.
1. Administration of Union Government Railways ... 704
2. Principles of Railway Administration. 704
3. Railway and Harbour Fund ... 704
4. Staff ... 705
5. Principal Officers of the Railway Administration ... 705
6. Expenditure on Salaries, Wages, and Pensions ... 705
7. South African Railways and Harbours Publicity Department ... 706

§ 5. Engines and Rolling Stock.
1. Engines in Service ... 707
2. Wagon, Coaching, and Merchandise Stock ... 707
3. Railway Workshops, Rolling Stock Built, etc ... 711

§ 6. Traffic.
1. Mileage Run and Passengers and Goods Carried ... 712
2. Train and Engine Mileage ... 712
3. Speed of Trains ... 712
4. Length of Journeys ... 713
5. Road-motor Services ... 714
6. Road-rail System of Transport ... 714

§ 7. Accidents.
1. Return of Accidents ... 715

§ 8. Passenger Fares and Goods and Live Stock Rates.
1. Tariff Policy ... 716
2. Passenger Fares ... 716
3. Parcels Rates ... 718
4. Live Stock Rates ... 718
5. Goods Rates ... 719

§ 9. Railway Finance.
1. Earnings ... 721
2. Working Expenditure ... 724
3. Expenditure from Capital ... 726
4. Cost of Construction ... 726

§ 10. Land Transportation: Miscellaneous.
1. Tramways ... 729
2. Motor Vehicles ... 730
3. Roads and Bridges ... 731
4. Report of the Roads and Bridges Committee ... 734

CHAPTER XXI.—POSTS, TELEGRAPHS, AND TELEPHONES.

PAGE

§ 1. Posts.

1. Origin and Development of Postal Service in South Africa..... 736
2. Postal Service of the Union..... 736
3. Postal Facilities..... 736
4. Union Mail Matter..... 737
5. British and Foreign Mail Matter..... 738
6. Cost of Mail Conveyance..... 738
7. Number of Employees..... 739
8. Financial..... 739
9. Rates of Postage..... 740
10. Money Orders..... 740
11. Postal Orders..... 743
12. Postal Drafts..... 744
13. South Africa to England Ocean Mail Service..... 744
14. Experimental Air Mail Service between Capetown and Durban..... 745
15. Average Flying Time..... 747

§ 2. Telegraphs.

1. First Lines Constructed and Development of Service..... 747
2. Statistics of Working..... 748
3. Rates for Transmission of Telegrams. 748
4. Wireless Telegraphy..... 748
5. Cable Service..... 749

§ 3. Telephones.

1. First Exchange and Development of Service..... 749
2. Farm Telephone Lines..... 749
3. Statistics of Working..... 750
4. Wireless Telephony..... 750

§ 4. Savings Bank.

1. Conduct of Savings Bank..... 751
2. Savings Bank Transactions..... 751

§ 5. Civil Aviation..... 751

§ 6. Bureau of National Information..... 751

CHAPTER XXII.—STATE FINANCE.

A.—General Financial System of the Union Government.

1. Statutory Provisions..... 752
2. Consolidated Revenue Fund..... 752
3. Railway and Harbour Fund..... 752
4. Public Debt Commissioners..... 752
5. Audit..... 753
6. Financial Relations between the Union Government and the Provinces..... 753

B.—Public Revenue and Expenditure of the Union.

§ 1. General Summary.

1. Revenue and Expenditure of States Prior to 1910..... 755
2. Revenue and Expenditure from 1910. 756

§ 2. Revenue of the Union.

1. Ordinary Revenue of the Union..... 756
2. Sources of Revenue..... 757
3. Customs Revenue..... 758
4. Excise Revenue..... 758
5. Revenue from Mining..... 759
6. Income Tax Act..... 759
7. Death and Succession Duties..... 766
8. Native Taxes..... 768
9. Land Revenue..... 768
10. Postal Revenue..... 770
11. Revenue Collected for Provinces..... 770

§ 3. Expenditure of the Union.

1. Ordinary Expenditure of the Union.. 770
2. Classified Summary of Ordinary Expenditure (Union)..... 771
3. General Government..... 771
4. Law, Order, and Protection..... 776
5. Higher Education and Advancement of Science..... 780
6. Public Health and Poor Relief..... 780
7. Lands and Agriculture..... 780
8. Mines and Industries..... 782

16. Other Savings Banks..... 828
17. Union Loan Certificates..... 829
18. Savings Clubs..... 830

§ 3. Land and Agricultural Bank of South Africa.

1. Establishment..... 831
2. Capital..... 831

PAGE

3. Cost of Capital..... 832
4. Management and Control..... 832
5. Operations of the Bank..... 832

§ 4. Building Societies..... 836

§ 5. Assurance.

1. Union Insurance Act..... 837
2. Statistics of Insurance in the Union. 838
3. Life Assurance..... 842

§ 6. Registration of Companies and Businesses.

1. Registration of Companies..... 846
2. Registration of Businesses..... 847

§ 7. Bonds Registration.

Value of Bonds Registered..... 848

§ 8. Insolvencies and Administration of Estates.

1. Return of Insolvencies..... 849
2. Estate of Deceased Persons, etc..... 850

CHAPTER XXIV.—POPULATION OF THE UNION.

§ 1. Population of the Union.

1. General..... 851
2. Regional Divisions..... 854
3. Proportions of the Races in British South Africa..... 854
4. Proportions of the Races in the Population of the Union..... 855
5. Population of Each Province..... 856

§ 2. Analysis of Population of Union.

1. Area of the Union..... 859
2. Density of the Population..... 859
3. Density of Rural Population..... 859
4. Densely and Sparsely Populated Districts..... 860
5. Density Compared with other Countries 860
6. Distribution of Races in Urban and Rural Areas..... 860
7. Proportions of Races in Urban and Rural Areas..... 861
8. Population Returns for Principal Towns..... 862
9. Population of each District in the Union..... 863
10. Distribution of Non-European Population..... 863
11. Ages of the People..... 863
12. Masculinity..... 865
13. Marital Condition of the People..... 865
14. Birthplaces of the People..... 866
15. Nationality of the People..... 868
16. Religions of the People..... 868
17. Official Languages Spoken..... 869
18. Occupations of the People..... 870

§ 3. Asiatic Population.

1. Asiatics in the Union, Numbers of.. 870
2. Indian Population of the Union..... 870
3. Asiatics in the Union, Legislation.... 871
4. Asiatic Inquiry Commission..... 872

§ 4. Immigration and Emigration.

1. Immigration into South Africa..... 872
2. Statistics of Migration..... 872
3. Migration of Europeans..... 875
4. Non-European Migration..... 883
5. Assistance and Regulation of Immigration..... 885
6. Permits..... 888
7. Passports..... 888

§ 5. Naturalization of Aliens.

1. Legislation..... 888
2. Effect of Naturalization under the Union Law..... 889
3. Number and Particulars of Certificates Issued..... 890

CHAPTER XXV.—VITAL STATISTICS.

§ 1. Registration of Births and Deaths.

1. System of Registration..... 891
2. Periods of Tabulation..... 892

§ 2. Births.

1. Births Registered..... 892
2. Births Registered according to Sex... 893
3. Birth Rate and Proportion of the Sexes..... 893
4. Births in Regional Divisions..... 895
5. Natural Increase..... 896
6. Births in Urban and Rural Areas.... 897
7. Plural Births..... 898
8. Illegitimate Births Registered..... 898

OFFICIAL YEAR BOOK

OF THE

UNION OF SOUTH AFRICA
AND OF BASUTOLAND, THE BECHUANALAND PROTECTORATE AND SWAZILAND.

PART I.

UNION OF SOUTH AFRICA.

INTRODUCTORY.

STATISTICAL SERVICE AND SOURCES OF INFORMATION.

§ 1. Statistical Service of the Union.

1. **Statistical Information prior to the Constitution of the Union.**—Apart from the statistics collected at each census of population,* the statistics published up to the constitution of the Union were those procured by various Government departments as an incident of the ordinary work of their administration. Special mention may be made of the work of the Customs Statistical Bureau, established by the South African Customs Union in July, 1905, which gathered and published comprehensive statistics in regard to oversea trade and shipping for all the States in British South Africa. Apart, however, from such sources of information as those mentioned, there existed no other organized means of obtaining statistics. When, therefore, the Union was constituted statistics were lacking in regard to many matters of essential importance to those concerned in the administration and development of the country.

Particulars of early statistical information in South Africa are contained in previous issues (Nos. 1, 2, 3, and 4) of this Year Book.

The following official publications indicate the chief printed sources of earlier statistical information for the territories now comprising the Union :—

Cape of Good Hope : Cape Statistical Register (1887–1911).

Natal : Departmental Reports (1896–1900); Blue Book of Natal (1890–1893); Statistical Year Book (1893–1909).

Transvaal : Staats Almanak voor de Zuid Afrikaansche Republiek (1897–1899); Statistics of the Transvaal (1902–1909); Transvaal Statistics (1902–1906).

2. **Statistical Service subsequent to the Constitution of the Union.**—The *Census Act* of 1910 provided for the taking of a census in the year 1911 and in any subsequent year determined by the Government. Section 34 (ii) of the *South Africa Act*, 1909, requires, for electoral purposes, that there shall be a quinquennial census of the European population. In order to undertake these operations, a Census Office was established in Pretoria in 1910. Subsequently an effort was made by the Director of Census to collect all available statistics in a satisfactory form, and an annual statistical publication (*The Statistical Year Book*) was inaugurated in 1913, giving either in detail or in abstract such information as was available in different Government departments. Owing, however, to the fact that legal authority

* A table giving the date of the taking of each census in the four Colonies now constituting the Union and of the first and subsequent censuses in the Union will be found in Chapter XXIV.

for the collection of statistics was wanting, the work was found in many ways to be unsatisfactory, and, in 1914, the Union Parliament provided the necessary powers for a complete system of statistics by passing the *Statistics Act* (No. 38 of 1914), empowering the collection and publication of statistics in respect of the following matters :—

(*a*) population ;
(*b*) vital, social, educational, and industrial matters, including rates of wages, cost of living, prices of commodities, and rents of habitations ;
(*c*) local government ;
(*d*) employment and non-employment ;
(*e*) imports and exports ;
(*f*) immigration and emigration ;
(*g*) posts, telegraphs, and telephones ;
(*h*) factories, mines, and productive industries generally ;
(*i*) agricultural, horticultural, viticultural, dairying, pastoral, and fishing industries ;
(*j*) banking, insurance, and finance ;
(*k*) railways, tramways, shipping and transport ;
(*l*) the tenure, occupation, and use of land ;

and any other matter prescribed by the Minister of the Interior.

For various reasons the *Statistics Act* was not promulgated until 1st April, 1917, but on that date a central Statistical Office for the Union was established. The following is an enumeration of the main provisions of the Act :—

(i) Provision is made for the appointment of an administering officer, and the *Director of Census* was appointed for the purpose.
(ii) A Statistical Council is provided for, to consist of not less than four and not more than eight members. The function of the Council is to advise the Minister in regard to matters connected with the Act.
(iii) Arrangements, if necessary or convenient, may be entered into with the Provincial Administrations with a view to the collection of statistics by means of officers of such Administrations.
(iv) Every person of whom information is required under the Act is compelled to supply it on demand.
(v) Officers under the Act, for the purposes of inspection and making inquiries, are given powers of entry upon any land or premises upon or within which any industrial undertaking is carried on, or persons are employed.

By the *Statistics Amendment Act* (No. 5 of 1919) authority was further granted for the issuing of regulations, if necessary, requiring particulars and information to be furnished by persons in prescribed areas or as to the addresses and occupations of persons or in respect of prescribed periods.

3. **Organization of Statistical Collection.**—(i) *General.*—The principle involved in the statistical organization of the Union under the *Statistics Act* is that of centralization. The statistics of South Africa prior to the promulgation of this Act were open to arraignment amongst other things on the following grounds, viz. : The restricted and incomplete character of available statistics ; the lack of coherence and common purpose ; the unevenness of quality ; in many cases the lateness of their presentation and their inaccessibility ; the duplication of publication and the inevitable conflict occasionally resulting therefrom, due to the detachment of the various Government Departments concerned with statistics ; and the expense of production due to lack of skilled supervision and the absence of mechanical tabulating appliances.

Centralization provides a remedy for the defects enumerated ; and already a large amount of co-ordination has been secured. Amongst certain operations for procuring statistics in regard to which important information was previously lacking, the following may be mentioned as having been initiated by the Union Office of Statistics :—

(*a*) An annual census of manufacturing industries.
(*b*) An annual census of agricultural and pastoral production.
(*c*) Investigations in regard to rates of wages, hours, and conditions of labour wholesale and retail prices, variations in the cost of living and kindred matters.

On the advice of the Statistical Council further branches of public statistics, including the subjects of banking, rates of exchange, insurance and general finance are obtained. The series of publications initiated has included *The Official Year Book* of the Union giving the substance of all available statistics and official information ; *Monthly Bulletins* designed to bring the information in the *Year Book* up to the latest possible date ; and sectional publications and monographs giving in greater detail from time to time the results of the various census operations and statistical investigations conducted by the Office.

The following schedule indicates the allocation of statistical collection among the various Government departments of the Union and provides a measure of the extent to which the work has so far been co-ordinated :—

Chapter of Official Year Book.	Subject.	Department or Office Responsible for Administration.	Office Responsible for Statistics.
XIII.	Agriculture—		
	Production		Census and Statistics Office
	Co-operation	Agriculture	Agriculture.
	Education	Agriculture	Agriculture.
XVIII.	Commerce—		
	Trade	Customs and Excise	Customs and Excise.
	Excise	Customs and Excise	Customs and Excise.
	Patents, etc.	Justice	Patents.
	Trading Licences	Provincial Administrations	
XXIII.	Currency, Banking & General Finance—		
	Banking	Treasury	Treasury.
	Land Bank	Treasury	Land Bank.
	Building Societies	—	Census and Statistics Office.
	Assurance	Treasury	Census and Statistics Office and Treasury.
	Registration of Companies, etc.	Justice	Registrars of Companies.
	Bonds	Lands	Registrars of Deeds.
	Insolvencies	Justice	Census and Statistics Office.
IV.	Education—		
	Higher	Education (Union)	Education (Union).
	Primary and Secondary	Provincial Administrations	Census and Statistics Office.
	Private Schools	—	Census and Statistics Office.
	Libraries, Museums, etc.	Interior	Census and Statistics Office.
	Newspapers	Posts and Telegraphs	Posts and Telegraphs.
II.	Electorate	Interior	Interior.
XV.	Fisheries	Provincial Administrations	Census and Statistics Office.
XIV.	Forests—		
	Government Undertakings.	Forests	Forests.
	General	Forests	Census and Statistics Office.
XIX.	Harbours	Railways and Harbours	Railways and Harbbours.
XII.	Irrigation and Water Conservation—		
	Irrigation	Irrigation	Irrigation.
	Other Water Conservation	—	Census and Statistics Office.
IX.	Justice—		
	Admission of Advocates, etc.	Justice	Justice.
	Crime	Justice	Census and Statistics Office.
	Prisons	Prisons	Census and Statistics Office.
V.	Labour and Industrial Conditions—		
	Employment and Unemployment	Labour	Labour.
	Wages and Hours of Labour	Labour	Census and Statistics Office.
	Trade Unions and Associations of Employers	Labour	Census and Statistics Office.
	Industrial Disputes	Labour	Labour.
	Miners' Phthisis	Mines and Industries	Miners' Phthisis Board and Bureau.
XI.	Land Survey, Tenure, and Occupation—		
	Land Settlement	Lands	Lands.
	Registration of Deeds	Lands	Registrars of Deeds.
	Valuation of Property	Provincial Administrations	Provincial Administration (Cape).
XVII.	Manufacturing Industries	Mines and Industries	Census and Statistics Office.
I.	Meteorology	Irrigation	Chief Meteorologist.
XXIV.	Migration	Interior	Census and Statistics Office.
XVI.	Mines	Mines and Industries	Government Mining Engr.
XX.	Motor Vehicles	Provincial Administrations	Census and Statistics Office.
XXVI.	Native Affairs	Native Affairs	Native Affairs.
XXIV.	Naturalization	Interior	Interior.
X.	Police and Protection	Police and Defence	Police and Defence.
XXIV.	Population	—	Census and Statistics Office.
XXI.	Posts, Telegraphs, and Telephones	Posts and Telegraphs	Posts and Telegraphs.
VI.	Prices and Cost of Living	—	Census and Statistics Office.
VII.	Public Health—		
	General	Public Health	Public Health.
	General Hospitals	Provincial Administrations	Provincial Administrations and Census and Statistics Office.
	Mental Hospitals	Interior	Interior and Census and Statistics Office.
	Leper Institutions	Public Health*	Public Health.*
	Venereal Diseases Hospitals	Public Health	Public Health.
	Registration of Medical Practitioners, etc.	Public Health	Public Health.

* From the 1st April, 1924; previously Interior.

Chapter of Official Year Book.	Subject.	Department or Office Responsible for Administration.	Office Responsible for Statistics.
XX.	Railways	Railways and Harbours	Railways and Harbours.
XX.	Roads and Bridges	Provincial Administrations	Census and Statistics Office.
XIX.	Shipping	Customs and Excise	Customs and Excise.
VIII.	Social Condition—		
	Ecclesiastical	—	Census and Statistics Office.
	Charitable Institutions	Provincial Administrations	Census and Statistics Office.
	Liquor Laws	Police	Census and Statistics Office.
	Divorces	Justice	Census and Statistics Office.
XXII.	State Finance—		
	Union	Treasury	Treasury.
	Provinces	Provincial Administrations	Treasury and Provincial Administrations.
XX.	Tramways	—	Census and Statistics Office.
XXV.	Vital Statistics	—	Census and Statistics Office.

(ii) *The Statistical Council.*—The Statistical Council is constituted as follows:—

Statutory Members:

Sir Johannes van Boeschoten.
Mr. Duncan Eadie.
Mr. J. G. van der Horst.
Professor R. A. Lehfeldt, D.Sc.
Mr. Robert Niven.
Dr. A. J. Orenstein, C.M.G.
Mr. A. M. Spies.

Chairman:

Dr. J. E. Holloway (Director of Census).

Official Members:

Agriculture.—Mr. P. J. du Toit, Secretary (Alternate: Col. G. N. Williams, D.S.O., Under-Secretary); Dr. F. E. Geldenhuys, Division of Economics and Markets.

Births and Deaths.—Mr. C. Boezaart (Pretoria) to alternate with Mr. C. W. H. Smit (Cape Town), Registrars.

Customs.—Mr. J. G. de Beer.

Labour.—Mr. C. W. Cousins, M.A., Secretary for Labour.

Mines and Industries.—H. Warington Smyth, C.M.G. (Alternate: Colonel K. Harvey); Sir Robert Kotze.

Public Health.—Dr. W. A. Murray.

Railways and Harbours.—Mr. W. Marshall, Financial Assistant to Railways and Harbours Administration.

(iii) *Office of Census and Statistics.*—The office of Census and Statistics is organized in the following sections:—

Section.	Scope of Duties.
Administration	General executive work.
Population	Population census (quinquennial); vital statistics; migration; hospitals.
Production	Agricultural, pastoral, and fisheries censuses; statistics of manufacturing industries (annual, quarterly, and monthly).
Social	Labour and wages; Retail prices (monthly); wholesale prices (quarterly); annual rent census; crime and penology; insolvencies; divorces; insurance; local government; charitable institutions; schools; miscellaneous.
Tabulation	Tabulation by means of electrical machinery.
Compilation and Computing	Tabulation by hand; calculations by machine or otherwise.
Publications	Publications of the Census Office; library; publication of volume of abridged annual reports of Government departments; revision of works of reference.

(iv) *Field Organization.*—In regard to a large number of the operations involved in the system of statistical organization above indicated the sections named are responsible for the organization of field collection, which involves in every case a very large amount of labour. For certain purposes, such as the censuses of agriculture and manufactures, the Union Police Force supplies the necessary field machinery in a most adequate manner. The police organization covers every part of the country and has been perfected to such an extent that for any operations of this kind it is able to render efficiently a service which

otherwise would involve a very heavy annual expenditure from public funds. Unfortunately the circumstances inevitably surrounding a population census render it impossible to utilize the assistance of the Police Force in this connexion to any very great extent, with the result that a complete system of field organization has to be improvised on the occasion of each census, involving in the Union, as in almost all other countries, a very serious but unavoidable item of public expenditure.

§ 2. Archives and Records.

1. **Archives.**—For many years prior to the constitution of the Union the Government of the Cape of Good Hope maintained a keeper of the archives, whose time was entirely employed in examining, indexing, and supervising the binding of the records relating to the period till 1806. The later records were not in his charge. In the Transvaal an Archives Branch of the Colonial Secretary's Department was constituted soon after the establishment of Crown Colony Government in 1902, to take custody of and examine that portion of the South African Republic records, which was preserved in the late State Secretary's Department, and such other records as might be collected. The records referred to were in a fairly complete condition and in a good state of preservation. An important work which was carried out subsequently was the translation into English of the Executive Council Resolutions, and the preparation of an English index. The English translation and index were printed. Neither in Natal nor in the Orange Free state was there a specially constituted Archives Department. Since the constitution of the Union, work in arranging and indexing the archives has been continued, partly in the ample accommodation provided in the Union Buildings in Pretoria, and partly in the Parliament Buildings and the new Supreme Court Buildings in Cape Town, There are also archives retained in Pietermaritzburg and Bloemfontein.

In 1918 the Government appointed an Archives Commission to supervise the publication of a portion of the archives and to recommend from time to time the steps considered desirable for the collection, preservation, and dis ribution of all written matter bearing on the past history and records of South Africa.

Act No. 9 of 1922 gave statutory authority to this Commission and made provision generally for the custody and control of the public archives of the Union. A chief archivis was appointed and archives depôts were created.

[Previous issues (Nos. 1, 2, and 3) of this Year Book contain notes on the Archives in each of the four Provinces of the Union, and on other similar records.]

2. **The Earliest Records of South Africa up to the First British Occupation, 1652–1795.**—An article on this subject by the Chief Archivist of the Union was published in the fifth and sixth issues of this Year Book.

3. **Records of the Cape of Good Hope during the First British Occupation, 1795–1803.**—A short article on this subject by the Chief Archivist of the Union was published in the seventh issue of this Year Book. The same author—C. Graham Botha—has published a detailed account of the records of this period in a work entitled "A Brief Guide to the Various Classes of Documents in the Cape Archives, 1652–1806."

4. **Records of the Cape of Good Hope during the days of the Batavian Republic, 1803–1806.***—The Treaty of Amiens in 1802 laid down that the Cape of Good Hope, then in occupation by Great Britain, should be ceded to Holland. The latter was governed by the Batavian Republic, which appointed Mr. Jacob Abraham de Mist, LL.D., a member of the Department for Indian Affairs, to draw up a report with reference to the future government of the Cape. This memorandum, which contains the deliberations and recommendations of the Department for Indian Affairs, with reference to the form and method of government which should ultimately be adopted at the Cape, is of great value to the historical student.†

De Mist made long and careful investigation of all the records and reports dealing with the Cape which were preserved in the office of the Dutch East India Company. He read all the available printed books of travel which were of value. Although he had undertaken a big task, yet he accomplished it in a competent manner, and his memorandum was approved of by the Batavian Government. His Report deals with the historical and geographical facts about the Cape, its population, religion, education, agriculture, mines, political government, town and country administration, judicial establishment, commerce, slaves and natives, military matters, finance, and the administration of everything dealing with the East India trade.

When the time arrived, he was sent out to the Cape to receive the country from the hands of the British, instal the new government officials, make such alterations as were necessary and issue instructions which it was anticipated would be eventually drafted into a Charter for the Colony. The regulations which he was to draw up were to be only provisional in character and were to be sent to Holland for approval before promulgation.

* Contributed by C. Graham Botha, Chief Archivist of the Union.
† Published by the Van Riebeek Society in 1920—Volume 3 of the Society's Publications.

In one of his early proclamations issued at the Cape he announced to the colonists that "It is the will of the Batavian people that this settlement will be no longer dependent upon the High Regency at Batavia, nor upon any commercial body whatsoever; the constitution has abolished all particular privileges of that nature, and the inhabitants of the Colony of the Cape will know in future no other Government than that which the Batavian people has appointed over themselves."

The provisional regulations issued during this period, 1803–1806, were sent to Holland for approval, but before they could be considered there the Cape was retaken by the British. Several of these were enforced, notwithstanding the absence of confirmation, and continued in use after 1806 until modified or repealed from time to time.

The executive and legislative authority during this period was like that of the Company's days vested in the Governor and a council. The original resolutions of this Council of Policy are to be found in the Cape Archives. The outgoing and incoming letters addressed from and to the Council to public officials, boards, or private individuals are extant, as well as the instructions issued to the government officials and departments.

From the resolutions and the letters much material will be found for the history of the period. The instructions give an insight into the administration of the government and are a valuable source of information. They relate to the following departments: Colonial Treasury, Court of Justice, Secretary and Secretariat of Policy, Substitute Secretary and Chartermaster, First Commissioner of Secretariat, Dispatch Clerk, Clerks generally, Receiver-General, Insolvent Chamber, Regulations, Management and Administration of Loan Bank, Orphan Chamber, Burger Senate, Receiver and Controller of Customs, Ordinary Receiver, Director, Bookkeeper and Master Printer, Printing Office.

There was little change in the judicial administration from that under the previous governments. There was the Superior Court, the Court of Justice established under the rule of the Dutch East India Company, which had civil and criminal jurisdiction. It was the Court of Appeal from judgments of the inferior courts, with the right of appeal from its sentences to the National Supreme Council at the Hague, and not, as in the British régime, to the governor, who was vested with an appellate jurisdiction, and if the amount in dispute was over £500 to the Privy Council. In each country district there was a Board of Landdrost and Heemraden, which took cognizance of civil cases up to a certain sum and also acted in an administrative capacity. This board not only formed a court of law but dealt with matters now entrusted to municipalities and divisional councils. In Cape Town there was another inferior court, the Court of Petty Cases, which had jurisdiction over small cases.

The civil and criminal records of the Court of Justice for 1803–1806 are complete in the Archives, and those referring to the Landdrost and Heemraden will be found with the records of the respective districts.

Before de Mist left Holland and during his stay at the Cape he kept his official correspondence separate, which includes letters received and dispatched and minutes. These form a useful series for the student who desires to study this period.

Taking the records of the Batavian Government as a whole, they are fairly complete, and to the student of this short period of our history will prove of the utmost value. This period is very interesting to study, for it shows a transitory stage between the methods of the Company's days and the more enlightened methods of the new régime. The general administration of the country was greatly improved during the latter time, and had the Cape remained under the Batavian Government greater satisfaction would have been caused to the colonists than during the earlier years.

§ 3. Bibliography of the Union of South Africa.

1. **Government Reports.**—The following is a classified list of the principal reports and similar publications issued by Government departments in the Union. In conjunction with certain of the periodicals and reference works mentioned in the next paragraph, it furnishes a guide to the official bibliography of the Union. Owing to the increasing number of reports being issued it has been found necessary to curtail the list, and such publications as are deemed to be of suspended interest have been omitted. No mention has been made of numerous publications which have emanated from the Publicity Department of the South African Railways and the South African Publicity Agent's Office in London. These, though interesting and informative, are of a special character. It is to be noted also that the annual reports of a number of Government departments have since 1920 been published in a somewhat abridged form in a combined volume.

REPORTS OF SELECT COMMITTEES, COMMISSIONS, ETC., AND OTHER GOVERNMENT PUBLICATIONS, SINCE 1910, CLASSIFIED ACCORDING TO SUBJECTS.

Agriculture.—Annual Report of Department of Agriculture; Reports of Select Committee on Drought Distress Relief Act; Reports (various) South Africa's Fresh Fruit Export Trade (1912); Storage and Handling of Grain in Europe, the United States and Canada (1915); Departmental Committee on Wheat Growing (1919); Rinderpest Expedition; Taxation of Incomes derived from Farming Operations (1919); Meat Trade Commission (1920); Egg Export Inquiry (1921); Sugar Inquiry Commission (1922); Drought Investigation Commission (1922 and 1924); Improvement in Transport of Live Stock and Development of Export Meat Trade (1923); Annual Census of Agricultural and Pastoral Production (from 1917–18).

Archives.—Annual Report of Department of Interior.

Asiatics.—Report of Select Committee on Disabilities of British Indians in the Transvaal (1919); Annual Report of Department of Interior; Asiatic and Chinese Registration; Indian Immigrants; Reports (various); Correspondence between the Secretary of State for the Colonies and the Governor-General and Ministers on the Draft Immigrants' Restriction Bill (1911); Indian Inquiry Commission (1914); Protector of Indian Immigrants (Natal); Asiatic Inquiry Commission (1921).

Child Welfare.—Annual Report of Secretary for Education (Union).

Commerce.—Annual Reports of Trades Commissioners; Annual and Monthly Trade Reports by the Department of Customs and Excise; Select Committee on Beef and Export Bounties Bill (1923); Reports (various); Exports of Meat (1921); Egg Export Inquiry (1922); Delegation to Investigate Reciprocal Trade Relations between the Union and Kenya, Uganda, and Tanganyika (1923); Fruit Export Trade (1925).

Cost of Living.—Reports of Select Committees on Cost of Living Commission Reports (1919); Social Statistics (Wages, Prices, etc.) from 1919 to 1922; Profiteering Bill (1920); Rents, Profiteering and Speculation in Foodstuffs Prevention Act (1921), Prices of Produce (1923); Reports (various); Economic Commission (1913); Special Commission on Cost of Living in Union (1916); Cost of Living Commission—General Report; Interim Reports (Wheat, Flour, and Bread) and Summary of Commission's Work to 19th January, 1918; Profits Report (1919); Interim Report, 1920 (Rise in Prices of Indian Foodstuffs; Government Assistance to Co-operative Societies; Control of Imports; Supervision of Distribution; Proposed Increase in the Manufacturers' Price of Candles).

Crime.—Reports of Select Committees on Suppression of Stock Thefts (1923); Annual Reports, Department of Justice, Police, and Prisons; Report of Commission on Assaults on Women (1913); Report on Statistics of Crime for Year 1923.

Currency and Banking.—Select Committee on Embargo on Specie (1920); Reports (various); Gold Conference (1919); Currency Conference, Pretoria (1921); Resumption of Gold Payments by Union (1925).

Defence.—Annual Report of Defence Department; Report of Select Committee on Provision for South African Forces in Present and Previous Wars (1919); Reports (various); War Stores Commission; Custodian of Enemy Property; Martial Law Inquiry Judicial Commission (1922); Commission of Inquiry (1925).

Education.—Annual Report of Secretary for Education (Union); Reports of Superintendents of Education (Cape, Natal, Transvaal, Orange Free State); Reports (various); University Commission (1914) Medical Inspection of Schools (Transvaal); Vocational Training and Continuation Classes (Transvaal, 1914); Committee on Industrial Education (1916); Agricultural Education (1922); South African Museum; Education Administration Commission (1923 and 1924).

Electorate.—Annual Report of Department of Interior (Registration of Voters; Parliamentary Elections) Reports of the Delimitation Commissions; Select Committee on Women's Enfranchisement Bill (1924); Amendment of South Africa Act (1925).

Excise.—Annual Reports of Department.

Finance.—Annual Reports of the Controller and Auditor General; Annual Reports of the Commissioner of Inland Revenue; Reports of Select Committees on Public Accounts; Revision of Pensions and Superannuation Funds (1920); Embargo on Export of Specie (1920); Reports (various); Public Debt Commissioners' Financial Relations Commission; Schedule of Pensions (Annual); Estimates of Revenue and Expenditure; Resumption of Gold Payments by Union (1925).

Fisheries.—Reports (Cape and Natal); Fisheries and Marine Biological Survey (1921–22).

Forests.—Annual Reports of Department of Forests; Reports on Afforestation Schemes (1918–19).

Game.—Annual Reports, Government Game Reserves, Transvaal.

Harbours (see also *Railways and Harbours*).—Annual and Monthly Trade Reports of the Department of Customs and Excise; Reports (various); Railways and Harbours Board (1922) on Walvis Bay Harbour Improvements; Sir George Buchanan on Principal Harbours of the Union (1923); Durban Harbour Improvement of Entrance (1924); Port Elizabeth Proposed Harbour Improvements (1924).

Hospitals.—Returns of Hospitals (Cape, Natal, Transvaal); Annual Reports of Provincial Auditors.

Housing.—Reports (various); Social Statistics (Wages, Prices, etc.) from 1919 to 1922; Central Housing Board, Housing Committee (1920 and 1924); Rents Charged for Shops and Business Premises (1925).

Industries.—Annual Reports of the Secretary for Mines and Industries; Annual Census of Manufacturing Industries (from 1915–1916); Report of Select Committee on Industrial Conciliation Bill (1923); Electricity Supply Commission—Annual Reports; Reports on Establishment of Electrical Undertaking at Witbank (1924), on Electrical Undertaking at Cape Town to provide power for Railway Electrification; Reports (various); Advisory Board of Industry and Science; Industries Advisory Board and Scientific and Technical Committee; Commission to Inquire into Conditions of Trade and Industries (1912), issued by Board of Trade and Industries.

Insurance.—Returns of Cape Life Assurance Companies.

Irrigation and Water Supply.—Annual Reports, Irrigation Department; Reports of Select Committees on Irrigation Projects; Hartebeestpoort Irrigation Scheme (Acquisition of Land) Bill (1918); Klip River Valley, Springs (1919).

Justice.—Annual Reports; Select Committee Reports on Criminal Procedure and Evidence Bill and Magistrates' Courts Bill (1916); Stock Theft Bill (1922); Adoption of Children Bill (1923).

Labour.—Reports of Select Committees on European Employment and Labour Conditions (1913); Apprenticeship Bill and Regulation of Wages Bill (1921) (to which was also referred the Juvenile Affairs Bill); Workmen's Compensation Bill (1924); Industrial Disputes and Trade Unions Bill (1924); Annual Report, Department of Mines; Labour; Reports (various); South African Delegate to International Labour Conferences; Kakamas Labour Colony Commission of Inquiry (1919); Unemployment Commission (1922).

Land Bank.—Annual Reports: Land and Agricultural Bank, Transvaal Land and Agricultural Bank; Land and Agricultural Loan Fund (Natal and Orange Free State).

Lands.—Annual Reports: Department of Lands, Registrars of Deeds, Surveyors-General; Reports of Select Committees on Crown Lands (on Preliminary Report of Kakamas Commission of Inquiry, 1921); Crown Lands (Sunday River Settlements, 1925); Report of Commission Inquiring into Matters concerning Surveys of Land (1921).

Language.—Report of Commission on the Language Ordinance (1917).

Lepers.—Annual Report, Department of Interior: Leper Asylums; Report of Government Research Bacteriologist, 1913: Leprosy.

Local Government.—Accounts, Local Authorities, Transvaal; Municipal Accounts, Transvaal; Annual Reports of the Provincial Auditors; Select Committee on Petitions of Simonstown and others (1925); Report of Local Government Commission (1915 and 1921).

Mental Patients.—Annual Report, Department of Interior; Mental Hospitals; Report of Commission on Mentally Disordered and Defective Persons.

Migration.—Annual Report of the Department of Interior; Report of Chief Immigration Officer, Cape (1913); Annual Reports on Statistics of Population (1916 to 1918); Special Reports of Census Department (1925).

Miners' Phthisis.—Reports of Select Committees on Working of Miners' Phthisis Acts (1912, 1920, and 1924); Miners' Phthisis Consolidation Bill (1925); Reports (various); Miners' Phthisis and Pulmonary Tuberculosis (1912); Miners' Phthisis Prevention Committee, Commission of Inquiry into Working of Miners' Phthisis Acts (1919); Interim Report of Miners' Phthisis Commission (1920); Miners' Phthisis Board and Miners' Phthisis Medical Bureau.

*Mines.**—Annual Reports; Department of Mines, Geological Survey; Annual and Monthly Reports Government Mining Engineer; Reports of Select Committees; East Rand Gold-bearing Areas (1916); Zoutpan Lease (1917); Gold Mining Industry (1918); South African Alkali and Lichtenburg Salt Pan Leases Bill (1922); Transvaal Precious and Base Metals Act, Further Amendment Bill (1923); Precious Stones Bill (1924); Reports (various); Mining Industry Board, Explosives; Notes on Coking Tests of Transvaal Coals (1911); Mine Benefits Funds Committee of Inquiry (1911); Means for Prevention of Explosion of Gas and Dust in Natal Collieries (1912); Natal Mines Rescue Stations (1914); Petroleum Prospects (1914); Witwatersrand Earth Tremors Committee (1915); Memorandum on Far East Rand (1916); Underground Mining Contracts (Witwatersrand Mines); State Mining Commission (1916–1917); Manganese Deposits (1917); Low Grade Mines Commission (1919); Coal Commission (Grading and Pooling of South African Coals, 1921); Mining Industry (Brace Commission, 1922).

Native Affairs.—Annual Report of Native Affairs Department; Reports of Select committees on Native Affairs: Third Report, 1913 (Allotments Granted to Natives in Cape Province), First Report, 1913 (Agreement between Portuguese Government and Witwatersrand Native Labour Association), Second Report, 1914 (Recognition of Native Ministers of Religion belonging to Native Separatist Churches as Marriage Officers and Granting of Church and School Sites in Native Locations to such Bodies), Second Report, 1916 (Lady Frere Water Supply), Third Report, 1917 (Grants and Reservations of Land), Fourth Report, 1917 (Native Affairs Administration Bill), Second Report, 1920 (Native Affairs Bill), First Report, 1923 [Natives (Urban Areas) Bill and Native Registration and Protection Bill]; Reports (various); Natives Land Commission, Native Grievances Inquiry (1913–14); Native Disturbances at Port Elizabeth (1920); Native Pass Laws (1920), Native Affairs Commission (1921); Native Location Surveys (1922); List of Government Headmen.

Parliament.—Conference on Future Constitution of Senate (1920); Joint Committee on use of Afrikaans in Bills, Acts, and Official Documents of Parliament (1925); Joint Committee of Senate and House of Assembly on Versional and other Discrepancies in Bills (1925); Senate Debates (1924–25); Assembly Debates (1924–1925).

Pensions.—Reports of Select Committees on Pension Fund for White Miners (1916) on War Pensions and Returned Soldiers (1920), Revision of Pensions and Superannuation Funds (1920), on Public Service and Pensions Bill (1923); Schedule of Pensions (Annual); Memorandum on Old Age Pension Scheme (1924); Report of War Pensions Commission (1925).

Police.—Annual Report of Department of Police.

Population.—Population Census Reports (1911, 1918, and 1921); Annual Reports on Statistics of Population (from 1916 to 1918).

Posts. Telegraphs, and Telephones.—Annual Report of the Department.

Prisons.—Annual Report of Prisons Department.

Property.—Report of the Valuation Commission (Cape, 1913).

Provincial Administration.—Report of the Provincial Administration Commission (1915); Report of the Provincial Finances Commission (1923).

Public Debt.—Reports of the Public Debt Commissioners.

Public Health.—Annual Report of Department of Public Health; Reports of Select Committee on Clause 34, Dental and Pharmacy Bill (1924); Reports (various); Health Officers (Cape Town); Influenza Epidemic Commission (1919); Tuberculosis Commission; Tuberculosis Survey of Union (1924); Commissioner for Mental Hygiene (1924).

Public Service.—Annual Report of the Public Service Commission; Reports of Select Committee on Public Service and Pensions Bill (1923); Reports of Public Service Reorganization Commission (1911–12); Reports of the Public Service Commission of Inquiry (1918–1920); Uniform Scales of Pay for Teachers (1923).

Railways and Harbours.—Annual Reports; Department of Railways and Harbours, Statement of Accounts, Estimates, Railway Board; Reports of Select Committee on Railways and Harbours; Various Service Regulations (1913); Overland Coal Rates (1916); Financial; On the Railways and Harbours Service Act Amendment and Further Provision Bill (1923); Reports (various); Railway Workshops (1911–12); Control and Management of Railways and Harbours; Railway and Harbour Staff (1912); Railway Commission of Inquiry (1914); Proposed New Lines of Railway; Electrification of Natal Main Line; Electrification of Certain Sections; Grain Elevators; Durban Grain Elevator Commission (1924).

Returned Soldiers.—Reports of Select Committee on War Pensions and Returned Soldiers (1920); Reports dealing with subject of Returned Soldiers and Assistance Granted to them.

Roads.—Report of Engineer-Superintendent of Roads, Natal.

Social Condition.—Reports of Select Committees on Drunkenness in the Western Districts of the Cape Province (1918); on the Working of the Transvaal Liquor Laws (1918); Social Statistics (Wages, Prices, etc.) from 1919 to 1922.

---

*See also bibliography included in Chapter XVI of this Year Book.

South-West Africa.—Report of the Administrator; Estimates of Revenue and Expenditure; Correspondence between the Secretary of State for the Colonies and the Governor-General on the Subject of Mandate for South-West Africa; Report of a Tour in Ovamboland (1915); Censuses of Population and Agriculture 1921; Report of Commission on Future Form of Government (1921); Report on the Rebellion of the Bondelzwarts (1922).

Strikes.—Annual Report of Department of Mines and Industries; Reports of Commissions: On Witwatersrand Disturbances (1913); On Mining Industry (Brace Commission, 1922).

Vermin.—Reports of Vermin Extermination Commission (Cape, 1924).

Veterinary.—Report of the Director of Veterinary Research; Annual Reports of the Department of Agriculture.

Vital Statistics.—Annual Reports on Statistics of Population (1916 to 1918).

Wages.—Reports of Select Committees on Garnisheeing Wages (1913); Social Statistics (Wages, Prices etc.) from 1919 to 1922.

2. **Works of Reference and Periodicals.**—The list hereunder enumerates the principal publications of a periodical or special character issued in the Union by public and official bodies and societies and by publishing companies. The list does not claim to be exhaustive :—

(a) *Year Books, Directories, and General Works of Reference—*

Official Year Book of the Union of South Africa.
South African Municipal Year Book.
South and East African Year Book and Guide (*Union-Castle Company*).
South African Who's Who (*Ken. Donaldson*).
Official Directory of Industrial Establishments, 1921.
Directory of South African Manufacturers, 1921 (*South African National Union*).
Federation of British Industries—Annual Reports on British South Africa.
Hortor's Diary and Law List for South Africa.

(b) *Agriculture, Industries, and Commerce—*

Periodicals—

Journal of the Department of Agriculture (*Official*).
The Sun and Agricultural Journal of South Africa.
Journal of the Western Province Agricultural Society.
Die Boere Koerant—The Farmers' Gazette (*Transvaal Agricultural Union*).
South African Sugar Journal.
South African Dairyman and Live Stock Journal.
Natal Farmers' and Agricultural Gazette.
The Farmers' Weekly.
The Farmers' Advocate.
Die Landbouweekblad.
South African Fruitgrower and Smallholder.
South African Gardening and Country Life.
*Journal of Industries (*Official*).
Industrial South Africa (with which is incorporated the South African Commerce and Manufacturers' Record).
South African Mining Review.
South African Mining and Engineering Journal.
South African Motorist.
The South African Builder.
The Architect, Builder, and Engineer.
The African Chemist and Druggist.
South African Stationery and Trades Journal.
South African Printer and Stationer.
Chambers of Commerce Journals (Cape Town, Johannesburg, and Pretoria(.
South African Railways and Harbours Magazine.
Standard Bank of South Africa—Monthly Review.
South African Banking Magazine.
Insurance, Banking, and Finance.
Dunn's Gazette.
Licensed Victualler's Gazette.
Cotton News Weekly.
The South African Cotton Growers' Journal.
The Social and Industrial Review (*Official, Department of Labour*).

Miscellaneous Reports—

Crops and Markets—Department of Agriculture (*Official*).
Agricultural Societies.
H.M. Trade Commissioner for South Africa.
Chambers of Commerce.
Transvaal Chamber of Mines.
Monthly Report on Trade of British South Africa (*Department of Customs and Excise*).
Annual Report on Trade and Shipping (*Department of Customs and Excise*).
Monthly Report on Mining Statistics (*Department of Mines and Industries*).
South African Railways and Harbours Bulletin (*Official*).
Annual Government Department Reports (*Official*).
Annual Report of Secretary for Mines and Industries and Government Mining Engineer (*Official*).

(c) *Labour Questions—*

Periodicals—

Amalgamated Society of Wood Workers—Monthly Report.
South African Master Builders' Federation Journal.
South African Typographical Journal.

(d) *Libraries, Museums, Learned Societies, etc.—*

Annual Reports of Libraries.
Annals of the South African Museum.
Annals of the Transvaal, Natal and other Museums.
Royal Observatory—Publications.
Union Observatory—Circulars.
South African Journal of Science.
Journals of the South African National Union (1908–11).
Medical Journal of South Africa.
South African Medical Record.
The South African Institute for Medical Research—Publications.
Tydskrif vir Wetenskap en Kuns.
Geological Society of South Africa—Transactions.
Chemical, Metallurgical, and Mining Society of South Africa.
South African Institute of Electrical Engineers—Transactions and Journal.
Journal of the South African Institute of Engineers.
Engineering in South Africa.
Journal of the Institute of Land Surveyors of Transvaal.
South African Law Journal.
Journal of the Institute of Bankers.
Child Welfare Association—Report.
Proceedings of the Economic Society of South Africa.

* Ceased publication with the December, 1925, issue.

(e) *General—*

Juta's Daily Reporter (Law Courts).
Monthly Summary of Decided Cases in the Supreme Court of South Africa (*Official*).
Manual of Criminal Procedure (*Official*).
Manual for Justices of the Peace (*Official*).
Mayors' Minutes and Municipal Year Books.
Valuation Rolls.
Municipal By-Laws.

3. **General Works.**—Previous issues of this Year Book contained detailed lists of the more important general works that have been published in connexion with South Africa up to the year 1923. Books which have appeared since that date are mentioned in the subjoined list, under appropriate headings:—

Biography—

Engelenburg (Dr. F. V.)—'n Onbekende Kruger; Pretoria: 1925.
Gerdener (Dr. G. B. A.)—Sarel Celliers; Pretoria: 1925.
Kestell (Dr. J. D.)—Christiaan de Wet; Kaapstad.
Lombard (J. P. la Grange)—Paul Kruger, die Volksman; Pretoria: 1925.
Malan (F. S.)—Marie Koopmans de Wet; Kaapstad: 1924.
Stent (Vere)—Some Incidents in the Life of Cecil Rhodes.
Van der Merwe (N. J.)—Marthinus Theunis Steyn; Kaapstad: 1924.
Walker (Prof. E. A.)—Lord de Villiers and His Times; London; 1925.

Economics—

De Kock (Dr. M. H.)—Selected Subjects in the Economic History of South Africa; Cape Town: 1924.
Lamont (A. B.)—Economic Geography of South Africa.
Vissering (Dr. G.)—Report on Gold Standard; Government Printer, Pretoria.
Bruwer (Dr. A. J.)—Protection in South Africa; Cape Town.

History and Description—

Brookes (Dr. E. H.)—The History of Native Policy in South Africa from 1830 to the present day; Cape Town: 1924.
Collins (Jas. A.)—The Struggles of an Infant State.
Engelbrecht (Dr. S. P.)—Geschiedenis van de Ned. Hervormde Kerk in Z.A.; Pretoria: 1925.
Engelbrecht (Dr. S. P.)—Paul Kruger's Amptelike Briewe, 1851–1877; Pretoria: 1925.
Fairbridge (Dorothea)—Lady Anne Barnard at the Cape of Good Hope.
Lugtenburg (Dr. A. H.)—Geskiedenis van die Onderwys in die S.A. Republiek, 1856–1900; Pretoria: 1925.
Malherbe (E. G.)—Education in South Africa, 1652-1922; Cape Town: 1925.
Preller (Gust. S.)—Volksraad Notule, Natal, 1839–1845; Pretoria: 1924.
Preller (Gust. S.)—Historiese Opstelle; Pretoria: 1925.
Spoelstra (B.)—Ons Volkslewe; Pretoria: 1922.

Natural Science—

Bews (Dr. J. W.)—Plant Forms and Their Evolution in South Africa.
Haagner (Alwin)—South African Mammals; London: 1920.

General—

Boshoff (Dr. S. P. E.)—Volk en Taal van Suid Afrika; Pretoria.
Brummer (Prof. N. J.)—South African Citizenship.
Kuyper (Dr. H. H.)—Zuid Afrika, Amsterdam: 1925.
Mentzel (O. F.)—Description of the Cape; (Van Riebeek Society).

CHAPTER I.

HISTORY AND DESCRIPTION.

§ 1. Discovery, Colonization, and Development of South Africa.

PREVIOUS issues of this *Year Book* (Nos. 1 to 7) contained a brief history of South Africa from the time of its discovery in 1487, its occupation by the Dutch in 1652, and its subsequent colonization to the establishment of the political Union in 1910. The section has not been repeated owing to considerations of space, but the course of events during that period and in more recent years is summarized in Chapter XXVIII. The story of the early expansion of the Cape Colony and the migration of the farming community into the interior is briefly told in § 2 below.

For other phases of South African history reference may also be made to Chapter II.

§ 2. The Early Expansion of the Cape Colony, with Special Reference to the Migration of the Farming Community.*

1. **Early Agriculturalists.**—When the authorities of the Dutch East India Company raised their standard on the shores of Table Bay in 1652, little did they think that South Africa would become what it is to-day. They were representatives of a mighty chartered company which was out for trade and trade only. Colonization, as we understand it, was not part of their programme. Yet, in the course of time, there sprang up a flourishing agricultural colony which completely altered the initial purpose. The chief factor which determined the establishment of a refreshment station in 1652 was economic.

At first the Dutch East India Company supplied its shipping and garrison with victuals obtained by its own activities, but towards the end of the seventeenth century this was taken over by the farming population, which had at this time become an important factor in the development of the country. The first farmers were those Company's servants who were given their discharge and granted land along the Liesbeek. They were the nucleus of that band of pioneers who, during the first decade of the eighteenth century, began to push their way into the interior of the Cape Colony.

Before the close of the seventeenth century, efforts were made from time to time to induce persons to come out from Europe and settle here, and an important accession to the population was the arrival of the French Refugees in 1688. Immigration was stopped after the first decade of the eighteenth century, and the increase of the population depended solely upon the natural increase, many of the sons taking up farming in preference to joining the service of the Company. The number of Company's servants who received their discharge and preferred to remain here helped also to swell the ranks of the colonists. The farmers formed a very large percentage of the population. Up to the first decade of the eighteenth century we may look upon the period as one of settlement which was followed by a period of dispersion. There were several reasons which accentuated this latter movement.

2. **Migration of Farmers.**—However hard the authorities endeavoured to prevent an expansion of the Colony by the community going inland, the attempts were almost fruitless. Despite laws and a wish to have the people near to headquarters, so as to keep an eye on them and use them for military purposes in case of need, the migration went on; the people *trekked* onwards and the Government followed.

The way for the advance of the farmers during the eighteenth century had, to some extent, been prepared by the explorers of the seventeenth century. These men had been sent out by the Company for the purpose of opening up a trade with the natives, ascertaining the potentialities of the country, and gaining geographical knowledge. The reasons were, on the whole, purely economic. Their direction was guided also by the same reasons, and the physical features of the country helped greatly to determine this as well. The early

* Contributed by C. Graham Botha, Chief Archivist of the Union.

explorers went first to the north-east and then south-east, keeping on the coast side of the mountain barriers. The farmers followed largely the same routes, keeping close to places where they could find pasturage and water for their cattle.

There were three types of farmers in the Colony during the eighteenth century : the wine farmers, the corn farmers, and the stock farmers. The first two lived in the more settled area of the Colony, part of the Western Province, as their industry would naturally demand. The last type, who raised cattle and sheep, frequently moved from place to place, so as to have water and pasturage for their stock. They formed a large proportion of the inland European population. The wine and the corn farmers held their land mostly on freehold tenure, while the stock farmers held theirs on lease or " loan." It was this last kind of land tenure which contributed greatly to the expansion of the farmers inland. The ground was obtained by merely settling on it and obtaining a permit from the Government allowing the farmer to remain there for pasturing his stock. This permission had to be renewed annually, and was seldom refused. When the ground became barren, the farmer simply moved farther afield, chose another spot and applied for a new lease. Such a farm was known as a " loan place," and most of the farms in the interior were held on this form of tenure. Sometimes a stock farmer held several farms in this manner and all lived a more or less nomadic life.

The first lines of expansion can be easily traced along the river-courses and the seaward side of the mountains. When the first pioneers had crossed the mountain barriers over the steep and dangerous passes, others soon followed. By the year 1730, farms were occupied as far as the present district of Clanwilliam in the north-west and Mossel Bay in the south-east. Between this date and 1750, the farmers had crossed the mountains parallel to the west coast and began to spread out in the present districts of Ceres and Calvinia. One group got as far as Namaqualand. In the forties, the Roggeveld began to be populated, and gradually Sutherland and Fraserburg districts were occupied. While the Bokkeveld and Roggeveld were gradually being settled, the line beyond George, after 1730, was not so pronounced. In 1756 a commencement was made across the mountains towards the Zwartberg into what is now Prince Albert. This line then pushed eastward on to Willowmore and Aberdeen, and met the route followed along the southern part converging towards what is now Graaff-Reinet.

In addition to the two lines which were progressing to the north-west and east respectively, a third one was being carried on through the Karroo. Here the farmers were not so ready to seek places. By the middle of the century they had advanced past the southern parts of the Klein Roggeveld up towards the Nieuwveld. In 1760, the present site of Beaufort West was occupied, and a few years later the area known as the Gouph. This line began to bend towards Graaff-Reinet. Others spread out over what is now the Eastern Province, as far as the western bank of the Fish River. It was about 1770 that Graaff-Reinet became occupied by the stock farmer.

In addition to the easy method of obtaining a " loan place," which contributed to this expansion, there was also another factor. Restrictive trade measures were placed upon the farmers by the Company, and as there were no overseas markets, the prices of agricultural produce fell considerably. This was one of several causes which made the farmers go inland.

§ 3. Colonial Dutch Architecture.*

Far removed from the attractions of modern ingenuity, patent " short cuts," and the like, are the sober and eminently common-sense buildings of the early settlers in the Western Province. In their endeavour to achieve the best that the primitive conditions permitted, and with their simple straightforwardness, although a trifle rough and ready, they command our interest and respect.

When the early pioneers sought to build, they naturally reproduced, as well as they were able, the forms of buildings with which they were familiar in Holland and the Netherlands. They were, however, confronted by the difficulties of a new and uncivilized country, where their choice of materials was strictly limited and nearly all the materials were in a raw state. Their difficulties were further aggravated by the fact that very few of them could have been skilled in the arts of building, and the local conditions dictated a good many

*Contributed by F. K. Kendall, F.R.I.B.A.

modifications, which continually threw them back on their own resources. The brick-work in Holland, being probably better than, or at least as good as, that to be found anywhere in the world, and the partiality therefor being highly developed in the minds of the artificers, very skilful and beautiful brick-work with divers variations in all sorts of details—moulded brick-work with bands of stone introduced, cuspings, sunk or raised panelling, mouldings, pilasters, etc.—became regular features.

The settlers had to make their bricks as best they could, and, largely through their inexperience, these were of an inferior kind. It must soon have become evident to them that the bricks were not sufficiently hard to withstand the fierce driving rains of this country, so that an additional protection was called for and forthcoming in the form of a plaster face. As lime of passable quality was generally available, this type of facing offered no great difficulty; on the contrary, it formed rather a welcome means of covering up the irregular and often inferior brick-work. A coat of whitewash, which could easily be renewed, gave a pleasing effect to the rough and ready structure; and as this was typical and expressive of the conditions prevailing, we cannot find fault with it on that account.

As regards roofing material, the settlers must again have been hard put to it to find a substitute for the fine, well-burnt, warm-coloured tiling of their native land. They were unable to produce tiles in anything like sufficient quantity under the new conditions, but, fortunately, the reeds which grow in profusion around the vleis and marshes were well adapted for thatch, and this rough and ready material harmonized extraordinarily well with the plain, whitewashed walls, and set a new and distinctive stamp upon the style of architecture which the settlers were endeavouring to develop. The warm, clear sunshine of this new land and the blue shadows of trees on the white plaster went a long way to enhance the simple beauties of this new expedient.

The details of the buildings generally followed their prototypes of the Netherlands fairly accurately, often being reproduced without any more substantial reason than mere tradition. For instance, the "flat treatment" and the use of shutters were evidently retained because the people were used to them and regarded them as the right thing. By the "flat treatment" is meant the system of placing doors and windows approximately flush with the outside face of the external walls, so that, when looked at from the outside, there are no deep "reveals" to give an appearance of thickness to the walls or to cast shadows, and provide interest and variety. In a sunny climate such as this, it would have been more rational to place the doors and windows flush with the inside of the walls, or, at all events, some way back from the outside face so as to shelter the glass from the blazing sun, and make it easier to construct weather-tight joints around the frames. But the settlers evidently preferred their tradition, and it is interesting to note that this construction had its origin in the Netherlands. The fact of the matter was that the marshy nature of the ground prevalent in Holland was the parent of this treatment, and it will readily be understood that a heavy wall requires more ample foundations in marshy soil than upon firm, solid ground. It, therefore, became very necessary to make the walls as light as possible, and "one-brick" walls (9 in. thick) were therefore customarily used. As the door and window frames were large and massive, frequently 6 in. thick, it was obviously impossible to fit them into walls of about 9 in. thickness without their appearing to be flush or nearly flush on the outside face. This arrangement was accepted and developed with a number of charming varieties by the Dutch people, who frequently introduced relieving arches and other designs with slightly sunk faces generally only $1\frac{1}{2}$ in. or so in depth, and this wholesale avoidance of deep recesses of any kind constitutes what may be called the "flat treatment."

Then as regards shutters, although many people have argued that these were introduced to exclude the sunlight from the rooms, this can immediately be disproved by the fact that the shutters filled with solid panels were attached only to the lower half of the sashes. If these had been intended to exclude the sunlight, they would have been fitted over the whole of the window; or, if half only were preferred, it would naturally have been the top and not the lower half that would have been shuttered. It has also been maintained that the shutters were for protection from thieves. While there is probably something in this contention, the fact remains that shutters were common, if not universal, in the old domestic buildings of Holland, and were fixed as often to the windows of the upper as to those of the ground floors. It seems thus most rational to regard the use of shutters in this country as a survival of tradition more than anything else.

The arrangements of the sash windows, though admittedly good to look upon, is far from satisfactory from the modern hygienic point of view, since the top sash was never made to open. As the rooms were generally from 12 ft. to 14 ft., or even more, in height, it follows that the upper half of the rooms was never adequately ventilated. The custom of opening the windows during the cool hours, and closing them and the shutters directly the sun rose, was soon established. The cool air thus enclosed in the rooms must generally have become rather vitiated; but it is presumed that the amount of fresh air the occupants got in the open was sufficient to fortify them against these rather unhealthy conditions.

Apart from the "flat treatment," the prominent use of gables is another and very dominating characteristic of the Dutch style. These are varied in design and, generally speaking, are extremely attractive. It is interesting to notice how the craftsman often

adapted his design to the material in which he worked. Mouldings, enrichments, and other decorations which adorn the gables, directly inspired by prototypes in stone or brick work, are now translated into plaster, and the projections and sections of the mouldings frequently partake of a rather free and plastic treatment such as the new material dictates.

In classifying gables, it is simplest to divide them under two headings, viz., "End Gables," and "Gables of the Dormer Type." The former are merely those which terminate main roofs; these may be sub-divided again into several different kinds according to their outline—the straight, the crow-stepped, and many varieties of curly gables. It is well to notice also that the marshy ground which we have already considered as modifying the walls was partly responsible for the prevalence of the gable. The ordinary straight frontage of a building was often terminated in one large gable with a steeply pitched roof. While the return walls would only be the height of the eaves (say two stories), the space enclosed within the huge roof would serve to accommodate two or even three additional stories, so that a large proportion of the room space is contrived within the roof, thus minimizing the amount of brick-work required and reducing the total weight of the fabric. With such thin high gable walls some additional stability was required, and the system of bolting the wall to the purlins, or heavy longitudinal beams which supported the rafters of the roof, was resorted to. Characteristic of the Dutch genius for domestic ornament, the bolts which were carried through these gable walls from the ends of the purlins were terminated in extremely pleasing "anchor-ties" of wrought-iron work, which generally were skilfully designed and wrought. The other type of gable was smaller and usually more elaborate. This was derived from the dormer windows which are cut through the roofs, and generally treated in a more or less classical manner—i.e. with some form of classic pediment at the termination, sometimes supported by pilasters far enough apart only to enclose a rather small central window. The vertical angles were then buttressed at each side by some sort of curly "swag" which gave it a more stable and graceful appearance. In this country the "swag" at the side was almost immediately developed laterally so as to add to the width of the gable, thus making it possible for it to cover the end of a sloping roof. The original prototype would most commonly have had the vertical "cheeks" of lead or hung tiling. Evidently this called for materials and workmanship superior to what the early settlers could supply, so it was not attempted. It became customary in this country to place a gable of this type over the main entrance to a house, letting it grow, so to speak, out of the middle of the main roof, and it was quite usual to decorate this gable with various ornaments, consisting usually of some conventional festoon of fruit or flowers or possibly the initials of the owner and date of the building. However, these dates have often been found misleading, since they frequently represented merely the date of some alteration or elaboration of the gable, and not the original construction.

The general plan of the houses was severely simple, and does not appear to follow any known precedent. The typical plan for a house in the country usually aimed at a shape similar to the letter "H"; this provided a long front wing facing the entrance drive, with a back wing of equal length and parallel to it and a connecting link in the centre opposite the main entrance. The three wings were equal in width, so that the roof construction was made as simple as possible, no doubt a very important factor with these early builders. It was customary also for the houses to be only one story in height—again, no doubt, due to the additional skill that would be required to construct high houses. But as ground was cheap and plentiful, it was quite natural that the builders should extend their houses laterally instead of vertically. It is possible that they may have attempted to utilize the roof space for attics, but the difficulties of plumbing in connexion with the necessary dormer windows, and doubtless the difficulties of leakage elsewhere through the thatch, in addition to the fact that the hot sun was apt to render such space uncomfortable, led to the abandonment of any such idea. The roof space was, however, brought into casual use as a loft, which was generally approached by a fixed ladder giving access through an opening in one of the end gables. The fact of the thatch being inflammable, caused a good many fires, so that a protection against this was devised by the introduction of "brand-zolder," a thickness to brick laid in clay above the top of the boarded ceiling. This non-inflammable insulator gave additional coolness to the rooms below, while securing them against destruction from fire in the event of the thatch burning.

§ 4. The Evolution and Recognition of the Afrikaans Language.*

The outstanding fact taught by the historical and comparative study of human speech is that language is never constant but always changing. The language of Iceland may appear very conservative when contrasted with the much-changed English language; and even English itself may seem to be very conservative during the nineteenth century when one observes the enormous changes it underwent during the eleventh century; yet a very elementary study will suffice to convince any one that neither Icelandic nor nineteenth century English has remained unchanged. It is a well-established fact that the child does not speak

*By Johannes J. Smith, Professor of Afrikaans, University of Stellenbosch, and Chief Editor of "Die Afrikaanse Woordeboek."

exactly like its father or mother, and later generations often understand but little of the language spoken by their ancestors a few centuries earlier; the inhabitants of a particular area usually employ a form of speech which at once distinguishes them from people dwelling in other parts of the same country; persons belonging to different social strata or occupations are distinguished from one another, not only by the amount of wealth they possess and by the customs in vogue amongst them, but also by the manner of their speech; and in practically every country there is a difference between the formal written language and the ordinary everyday speech even as used by the cultured and upper classes.

The Dutch South African of to-day, too, no longer speaks like his Netherlandish ancestors of the seventeenth century, nor like his modern kinsmen in Holland, although the great similarity between their two forms of speech is at once obvious to the most casual observer.

In the Netherlands the Dutch of the seventeenth century gradually changed to modern Dutch, while in South Africa it changed to Afrikaans. The changes which transformed seventeenth century Netherlandish into Afrikaans are, however, so striking and so much more radical than those undergone by the Netherlandish language in Europe that the evolution of Afrikaans is rightly regarded as an event of primary importance in the history of the Germanic family of languages—an event as remarkable as the change ot Anglo-Saxon into modern English.

There is, however, another event in connexion with Afrikaans which is of exceptional importance to all persons in any way interested in the study of language, namely, the raising, within an incredibly short time, of the formerly despised and generally condemned Afrikaans dialect to the rank, not only of a written language already possessing a literature of no mean merit, but also of one of the official languages of a modern State which still is and wishes to remain in daily contact with the old culture and traditions of Western Europe.

This essay is an attempt to deal briefly with the most important matters that led to these two events in connexion with the Afrikaans language.

Why Netherlandish changed to Afrikaans in South Africa is a problem which has engaged the attention of philologists for a considerable time. Several theories have been advanced; but it is remarkable that nearly all the earlier investigators ascribed the change to foreign influence. Thus it has been asserted that Afrikaans owes its origin to the influence of the French of the Huguenots, of the language of the Hottentots, of the Creole-Portuguese of the slaves, or of the broken Netherlandish of the French, Hottentots, and slaves.

The French theory was soon rejected. It was altogether too obvious that the 176 French Huguenots who arrived here during the years 1688–1690 could not possibly have caused the change in a language which not only enjoyed all the privileges of an only official language, but which was also in daily use among Netherlanders and Low Germans seven times more numerous than the French. The French language disappeared, leaving hardly a trace. The opinion that was formerly held that *ons* (in place of the Netherlandish *wij*) or the double negative was to be ascribed to the influence of the French Huguenots now seems incorrect, the most probable explanation being that these peculiarities have been inherited from the Netherlandish dialects spoken by the ancestors of the Dutch South Africans, and thereafter generalized in South Africa. *Ons* in place of *wij* is quite common in Zeeland, a province from which a comparatively large number of women came before 1691, while the double *nie* is to-day still found in the dialect of the Jordaan, formerly a peasant village near Amsterdam. Words of undoubted French origin, such as *andoelie, kaskenade, koewertuur, oblietjie, portfesie(deur), punteneurig*, have also been regarded as Huguenot words; but all, these are found in Dutch or in the Netherlandish dialects—sometimes, as in the case of *kaskenade* and *portfesie(deur)*, in exactly the same corrupted forms—a fact which points strongly to one act of borrowing, and not to two. It should be remembered in this connexion that already as early as the twelfth century the Netherlanders were subject to strong French influence, and that such words as *abuis, affère, affodil, akkoord, aspersie, balie, bataljie, bombarie, different, ferweel, frikkedel, kapabel, kasarm, kastrol, latei, subtiel*, and hundreds more, were brought from the Netherlands by the Dutch colonists, and not borrowed here from the few French Huguenots. Most probably only a few fruit names came from the language of the Huguenots—*bermot-sersan(peer), pawee(perske)*, and *sermyn(peer)*; and even these are not entirely free from doubt. There is, however, a large number of family names of Huguenot origin, such as *Cronje, De Villiers, Du Plessis, Du Toit, Fourie, Fouché, Hugo, Le Grange, Le Roux, Malan, Malherbe, Marais, Mouton, Nel, Pienaar, Retief*, etc. A large number of French names of farms is also found in Frenchhoek, Drakenstein, and other parts, e.g. *Champagne, Dauphiné, La Motte, Languedoc, Montpellier*.

Here I also wish briefly to deal with the influence exercised by that other group of Europeans that was incorporated into the Afrikaans population in early times—I refer to the German colonists or, to be more exact, to the Low German colonists from the north-west ot Germany—although a German theory in connexion with the origin of Afrikaans has not actually been formulated by any one. The Germans did not exert a great deal of influence on Afrikaans. To begin with, their language was very closely related to that of the Dutch colonists; moreover, most of them came to South Africa at a comparatively late date, after the nucleus of the people was already here; and, lastly, they married Netherlandish or South African women in almost every case. Although there is quite a number of words, such as

blits, omsons, peits, sens, stewel, uitwiks, verfoes, werskaf, which at first sight look rather more like German words than like the corresponding words in the standard language of the Netherlands, yet a little study of the Dutch language of the seventeenth century or of the dialects of the Netherlands—especially those spoken in the provinces of North Holland, South Holland, Zeeland, and Utrecht, where the vast majority of the early South African colonists came from—will very soon convince us that most of those words are not of German origin. At present German origin seems acceptable in the case of only a few Afrikaans words, namely, *dan en wan, jaarhonderd, laer, by my siks,* and perhaps also *bolmakiesie* and *strawasie.* Of German family names, however, there is a vast number—e.g. *Hauptfleisch, Holtzhausen, Krige, Kruger, Neethling, Von Wielligh, Wiehahn.* It has been calculated that the proportion of German blood in the Afrikaans colonists up to the year 1806 was about 27 per cent., while the French contributed 17, the Dutch fully 50, and other nationalities about 6 per cent. The German element was still quite insignificant in 1691—the year when the children born in this country first exceeded in number the immigrants from elsewhere, and when, accordingly, the nucleus of the new Afrikaans people was already in the country. The Germans, therefore, could not have exercised any great influence on the formation of the Afrikaans people and language.

The influence of the Hottentot language on Afrikaans is evident only in the vocabulary —and that in a very slight degree—and it is remarkable that the words borrowed are, with one or two exceptions, nouns—chiefly names of plants and animals. The following words of Hottentot origin are fairly generally known : *abba, arrie !, boegoe, dagga, gang !, ganna, kamma, karos, kierie, koedoe, kwagga, oorbietjie.* Probably also of Hottentot origin are the interjections *eina !, sie !,* and *soe !.* The following words are also Hottentot, but they only occur in certain parts of the country and are not generally known : *abiekwa(boom), arrie* (edible plant), *baroe, dwa* or *twa* (kind of grass), *ghaap, ghnarra(bos), ghoe(boontjie), ghoena, ghoukom, ghwarrie(boom), gora* or *gorê, kaam(bessie), kambro, karree(boom), karie(moer), karkoer, koekmakranka, nadroe(jakhals), namakwa(duif), noemetjie* (buck), *noem-noem(bessie), orra(bok), samma, sonkwas(riet).* In addition, there is a number of Hottentot geographical names such as *Aughrabies, Gamka, Garies, Ghoup, Goudini, Gourits, Kakamas, Kamdebo-(berge), Kamies(berge), Karo, Keimoes, Keiskamma, O'okiep, Prieska,* and others.

The colonists had very little intimate dealings with the Bushmen, and apparently nothing has been directly borrowed from their language.

It was only during the second half of the eighteenth century that a portion of the European inhabitants came in contact with the Bantus ; and a very large proportion of the Afrikaans-speaking population of to-day is still free from all Bantu influence. The result is that only a few Bantu words known from books and periodicals are at all generally understood—e.g. *iempie, indoena, mamba, tsetse.* The following are known only in certain parts : *amaas, dagha, dongha, dwala* or *toeala, ghoeboe(mielies), gramadoelas, imbongo, impala, indaba, kaboe(mielies), letieng, lobóla, magêo, mahem, mahôbe, majóba, makketaan, maranka, maroela, moepel, mopanie, na(boom), okapie, palla, pitso, poekoe, siebieba, sjêba, tamboekie(gras), tambotie(hout), tekwaan, tjabóntjie, tjaile, tollie.* Besides these, there are also numbers of Bantu proper names, such as *Amatólas, Congella, Indwe, Koeroeman, Majoeba, Maseroe, Oemsimwoeboe, Oemtata, Thabantsjoe, Toeghêla.*

But it is especially the corrupt Portuguese of the slaves that has been adduced by philologists as the principal cause of the transformation of Netherlandish into Afrikaans. This corrupt Portuguese was introduced into South Africa with the slaves from the East Indies and the African coast ; to a less extent it was also used as a means of intercourse between Europeans of different nationalities meeting in the harbour of Cape Town. It was the language originally learned from Portuguese traders in the different parts visited by them, and already by the year 1700 it had become so corrupted and simplified that it retained but little of the European Portuguese system of inflections. It differed in different regions, and it was obviously not uniform at the Cape either, for here were slaves from Angola, Mozambique, the Indian coast, Ceylon, and the islands of the Malay Archipelago. Seeing that a large number of slaves came from the Malay Archipelago, the Portuguese *lingua franca* is generally referred to as Malay-Portuguese, although Creole-Portuguese would be a much more correct name for the corrupt Portuguese formerly spoken chiefly by the slave population at the Cape.

Here again it is only in the Afrikaans vocabulary that the influence of this Creole-Portuguese can be proved beyond any doubt. The number of Afrikaans words from this source amounts to about a hundred, although the vast majority of these need not have been borrowed directly by Afrikaans, since they also occur in Netherlandish or Indo-Netherlandish—often long before the founding of the Cape. Such words are : *aia, akkerwanie, albertkoord, asgaai, atjar, baadjie, baar, baklei, bamboes, blatjang, bobotie, borrie* (" curcuma "), *doepa, flamink, goiing, gorlet(kom* or *-beker), hadjie, jamboes, josie, kaaiman, kabaai, kakketoa, kakkerlak, kaladie(blaar), kaliefa, kaparrings, kapater, kapok, karet(kam), katel, katjang-(boontjies), katjangghorries* (" monkey-nuts "), *katjiepiering, katjiepoet(olie), kiaat(hout), kipersol(boom), klapper, koelie, kraal, (oor)krabbetjie, kramat, kris, kuspidoor, laksel* (" vermicelli "), *lemmetjie, likkewaan, loerie, mandoor, mebos, mielie, nonna* and *nonnie, nooi, orang-oetang, pagaai, pangeran* (kind of fish), *papegaai, pienang, piering, piesang, pikkewyn, poewassa,*

pondok, rissies, rotting, sago, sambal, sambok, sambreel, sammejoa, saranie, seroet, soebat, soetemaling, sosatie, stramboel, tjap, tjoema, toering, tronk. If, in discussing these words, we remember that the Netherlanders had traded directly with the East Indies for fifty years before the founding of the Cape settlement, and that they had already traded with Lisbon a century before that, then it seems highly probable that we have to do with only one borrowing in the case of all Portuguese, Creole-Portuguese, or Malay words which occur in the same or about the same form both in Afrikaans, Netherlandish, or Indo-Netherlandish. The same methods of investigation should be applied to these borrowings as to the possible French words in Afrikaans, and it seems to me very illogical to class, as some philologists have done, *kipersol* or *oorlam* as words directly borrowed by Afrikaans, while they would never dream of accepting *kaskenade* and *portfesie*(*deur*) as evidence of French influence.

The following words of Creole-Portuguese origin have not yet, as far as I know, been found in Netherlandish or Indo-Netherlandish, and it is possible that they were directly borrowed by Afrikaans from the language of the slaves: *bredie, kurang, koffea, laai, moesoek, paljas, pamperlang, ramkie, ramsammie* ("snake charmer"), *sampiet* ("sucking tube"), *sieal, tamaai, tassal, tjommel.* Most of these words, however, are not generally known.

Several attempts have been made to find traces of Creole-Portuguese influence in the sound system and syntax of Afrikaans; but practically all such attempts must be regarded as having signally failed, other and better explanations being possible in most cases. In such attempts, as a rule, the stages of development already reached by the Netherlandish dialects from which Afrikaans sprang are not sufficiently kept in view, and usually, also, too little importance is attached to exactly parallel developments in other Germanic languages.

The Creole-Portuguese theory regarding the transformation of Netherlandish into Afrikaans is by no means proved by the slight traces of influence that are found almost exclusively in the vocabulary, and it also becomes most improbable when one bears in mind that the slaves stood much lower in the social scale than their masters. It is quite contrary to all experience for a master to allow his own language to be corrupted under the influence of the speech of his underlings. We know that the colonists from the earliest times looked down upon the slaves as a low class of people; and we also know that the number of slaves barely exceeded that of the white population as late as the year 1754. The number of female slaves, especially, was very small, and in 1691—when the number of whites born in South Africa first exceeded the number of immigrants from abroad—the free burghers, then about 1,000 in number, possessed only 230 male slaves, 44 female slaves, and 36 slave children.

Another improbable theory is that the Netherlandish of the first colonists degenerated under the influence of the broken Netherlandish used by the great number of strangers—French, Germans, Hottentots, and slaves—who were forced by circumstances to adopt the official language of the new colony. We know that the Low German ancestors of the Dutch South Africans did not arrive in large numbers till after 1691, and that the French comprised only one-eighth of the population; it is therefore evident that the influence of these two races on the language of the colony must have been comparatively insignificant.

That the Netherlandish of slaves and Hottentots could be responsible for the change in the grammatical structure of Afrikaans seems equally little warranted either by the social relations between the two races in the past or by the existing form of Afrikaans. The Netherlandish spoken by slaves and Hottentots would be Creole-Netherlandish; but such characteristic Creole peculiarities as the rejection of the inverted order of words (e.g. "*Môre ek gaan weg,*" instead of "*Môre gaan ek weg*"), the simplification of groups of consonants at the beginning of words (e.g. *setoeloe* in place of *stoel*), the placing of the negative before the finite verb (e.g. "*Ek nie weet*" instead of "*Ek weet nie*") are not found in the Afrikaans of the white people.

In my opinion, the theory best supported by the facts both of language and of history is the so-called spontaneous one—i.e. the theory that holds that present-day Afrikaans is a direct, unbroken development of the Netherlandish of the seventeenth century colonists. The term "spontaneous development" by no means precludes the possibility of all kinds of influences having been exerted directly upon the language; and the supporters of this theory do not wish in any way to deny that there is a certain number of Portuguese, Creole-Portuguese, or Malay words in Afrikaans. But all such influences are secondary matters and not deciding factors in the change. The spontaneous theory also differs most signally from all theories postulating a clash of languages—theories which maintain that Netherlandish clashed, as it were, with a dissimilar language as a result of the Netherlandish colonists having been suddenly forced to speak that other language. Spontaneous development means that the language grew out of itself, more slowly or more rapidly, according as the conservative influences were stronger or weaker. A seed growing into a tree is an example of spontaneous development, although all sorts of outside influences such as sunshine, water, soil, manure, pruning, and environment may help to further or retard its growth; if, however, the tree should be cut down and a strange shoot grafted upon it, this would no longer be spontaneous development.

Clash of languages is indeed one of the chief causes of sudden change in language, but it is not the only cause. Changes in the life and habits of the people speaking the language,

isolation from the controlling influence of cognate languages or dialects, and especially the absence of conserving influences such as those exerted by churches, schools, literary or influential classes, books and periodicals, promote sudden changes in language. In other words, we find the general causes of change in a language in the social condition of its speakers. A conservative race living in a conservative environment does not as a rule indulge in great linguistic changes.

The Dutch colonists of South Africa lived under very unconservative conditions. It was an entirely new kind of country, with new occupations and new duties. The farming population moved inland at an early date and gradually became quite isolated from the Netherlands—in fact, even from Cape Town. There was no postal communication, nor were there good roads till late in the nineteenth century, and for most people born here a visit to Cape Town was a memorable experience. Conserving influences were few indeed. Most of the colonists read nothing but the Dutch Bible in the translation authorized by the States General, and a few other religious books. Before 1750 there were only four churches and a few schools in the country districts, and the farm children of the seventeenth and eighteenth centuries learnt little besides reading, writing, and the answers to the catechism. Nor should it be forgotten that there was no continuous stream of fresh immigrants to the Cape who could help to foster the language and culture of the home country. As early as 1691 we find the number of children born in the country greater than the number of immigrants, and after the arrival of the French Huguenots in 1688–1690 there was practically no more direct immigration. The real European nucleus of the Afrikaans people was therefore in the country before 1691—a mere handful of a thousand people amongst surroundings strikingly unlike those of the Netherlands, not only as regards the country and its occupations, but also as regards its very society with its French and German aliens and its slaves and Hottentots.

The language change effected in South Africa forms an interesting parallel to the development of Anglo-Saxon to the English of the beginning of the twelfth century—and the causes were also much the same in both cases. It is interesting to note that also in the case of English a clash of languages was postulated by the first investigators in order to explain the tremendous changes in that language; to-day, however, no philologist believes that the influence of Norman French was primarily and directly responsible for the change.

The German soldier and "houtsnarijver," Otto Frederik Mentzel, who was at the Cape during the period 1733–1741, already tells us that the speech of the South African farmers was as little pure Dutch as the speech of the German peasants was pure German. From this, as well as from other evidence, we conclude that the inhabitants of Cape Town spoke "pure Dutch" for a much longer period than did the farmers in the country districts. These latter were the real forefathers of the South African Dutch nation, and since the time of Adam Tas (early eighteenth century) they became more and more estranged from Cape Town with its official element and its rapidly changing population. But whether the rustic dialect mentioned by Mentzel was still an unaltered Dutch peasant dialect, differing but little from the numerous dialects of the mother country, or whether it was already some form of Afrikaans, cannot be determined with certainty. Mentzel unfortunately gives us no particulars except that the country women say *ons* with a full mouth instead of *wij*. A few documents, however, dating from the second half of the eighteenth century and written in a marked Africanized Netherlandish—e.g. the journal of Hendrik Jacob Wikar (1775–1779), the "Lied ter Eere van de Zwellendamse en Diverse andere Helden, by die Bloedige Actie aan Muisenberg in dato 7 Augustus 1795," and several old letters that have been preserved—furnish strong support to the view that the Dutch language brought with them by the first colonists had developed into Afrikaans soon after 1750. From the evidence of Heinrich Lichtenstein, who was here during the time of Janssens, and of William Burchell, who travelled in the country in 1810 and subsequent years, it is clear that Afrikaans was a distinct form of speech by the beginning of the nineteenth century.

Writings composed in comparatively pure Afrikaans are, however, very rare before 1860, for up to that date, and also for many years afterwards, nearly everybody was still making use of Netherlandish, though this Netherlandish was often very faulty and much more like Afrikaans than like proper Netherlandish. But from such Africanized Netherlandish writings (e.g. the journal of Louis Trigardt, 1836–1838), from Dr. Changuion's "Proeve van Kaapsch Taaleigen" (published at the end of his Dutch grammar, "De Nederduitsche Taal in Zuid Afrika hersteld," 1844), and from one or two rhymes like "Kaatjie Kekkelbek" (published in *Sam Sly's Journal*, 1846), it is possible to get some idea of the spoken Afrikaans of the first half of the nineteenth century.

After the Cape had become an English possession, the language of the old colonists was gradually pushed into the background, until it was prohibited in official documents in 1825 and in courts of law in 1828. The Responsible Government Ordinance of 1852 provided only for the use of English in Parliament. The schools, too, were gradually being Anglicized; English and Scotch teachers and ministers of religion were imported with the avowed object of spreading the English language among the farming population; and in 1865 English became the sole medium of instruction in Government schools. After 1850 the supremacy of English appeared an accomplished fact to most people. It was the medium of instruction

in the schools, practically the only language used by the Government at the Cape, and it even gained ground in the pulpits of the Dutch Reformed churches. Nor was it only in the English colony of the Cape that the English language was extending its sway; in the Free State and the Transvaal trade and commerce and the public Press of the towns were contributing their share to Anglicize the community; afterwards the influx of foreign miners still further strengthened English influence in the north; and not only Cape newspapers like *De Zuid Afrikaan* and *Het Volksblad*, but also Free State and Transvaal papers like *De Vriend*, *De Transvaal Argus*, and *De Volkstem*, published leading articles in English and Netherlandish, while they also contained other English articles as well as a short English summary of the Netherlandish portion.

At this time there prevailed a great deal of pessimism regarding the continued existence of the language of the old colonists, and the English Press made determined attacks on the rights of Netherlandish as a written instrument, while they branded the Afrikaans spoken language as an unserviceable and useless "jargon," that had so far fallen away from real Netherlandish that it no longer justified the use of Netherlandish as an official language. The aggressive attitude of the English Press and the gradual growth of pro-English sentiment in church and school roused the antipathy of a small minority of patriotic men, and even in the fifties there were voices pleading not only for Netherlandish, but also for "the pure and melodious, albeit grammatically irregular, form of that language which is spoken in South Africa" (*Het Volksblad* of 13th May, 1858).

The greatest stimulus that Afrikaans received in those early days did not, however, come from Dutch South Africans consciously striving to foster their language, but from the then magistrate of Cradock, Louis Henry Meurant ("Klaas Waarzegger"), although it was by no means his intention to promote the establishment of a written Afrikaans language. He was pleading for the political separation of the Eastern Province; and in order to convince the Dutch farmers of the eastern districts of the desirability of separation, he began in 1860 anonymously to publish his "Zamenspraak tusschen Klaas Waarzegger en Jan Twijfelaar over het onderwerp van Afscheiding" in the *Cradock News*. Shortly after, in 1861, this "Zamenspraak" appeared as a pamphlet of seventy-five pages, and the public read it with avidity. The Afrikaans of this pamphlet still shows Netherlandish influence, especially in the spelling, but the language is without doubt Afrikaans. The example of "Klaas Waarzegger" was highly infectious, and from that date the newspapers show a steadily increasing amount of correspondence in "Boere-Hollands." Between 1861 and 1872 we find numbers of letters as well as some dialogues, rhymes, and other contributions in Afrikaans—especially in *Het Volksblad* (Cape Town), but also in *De Zuid Afrikaan* (Cape Town), *De Transvaal Argus* (Potchefstroom), *De Tijd* (Bloemfontein), and other newspapers. And it was by no means merely rhymes and jokes that appeared in the vernacular at this time; also serious subjects like education, politics, church services, and agriculture were discussed in this form of speech. The Afrikaans of such contributions is mostly inconsistent and impure—as one would naturally expect in those days prior to any regulation of the spelling; nevertheless, it is plain that the new form of language was gradually gaining more adherents, though it also called forth strong adverse comment.

The first volume of real Afrikaans poetry seems also to have appeared in the year 1861. There is a short review of this volume in *Het Volksblad* of 2nd November, 1861; but as yet I have not been able to learn of the existence of a single copy.

Amongst those early writers it was particularly "Behrend Moddermannetje" in *De Transvaal Argus* (Potchefstroom) of 1866–1869, "Trijna Snaaks" in *De Tijd* (Bloemfontein) of 1867–1868, and "Samuel Zwaartman" in *Het Volksblad* (Cape Town) of 1870 and later years, who supplied the reading public with Afrikaans contributions. Especially noteworthy was the influence exerted by "Samuel Zwaartman," of Fraserburg, who wrote a number of "Boerebriewe," in which he supplied local news, and his "Kaapsche Schetsen," in which he discussed serious subjects in connexion with the government of the country, the law courts, and education. "Since Samuel commenced writing in your paper, everybody is reading it," wrote a correspondent to the editor of *Het Volksblad* in June, 1870.

The year 1870 is most important for yet another reason. In July of that year F. W. Reitz published his "Klaas Gezwint en sy Paert" in *Het Volksblad*, followed shortly afterwards by "Die Steweltjies van Sannie" and other poems by President Reitz or by his father. These poems were taken over by most of the newspapers of that time, and everywhere they were received with marked approval. "Die Steweltjies van Sannie" was recited "with much taste" (*met veel smaak*) by the Attorney-General of the Transvaal at a literary gathering in June, 1874.

In September, 1872, a movement was started with the avowed object of using Afrikaans as a written language. It began with a letter in *De Zuid Afrikaan* by Arnoldus Pannevis, a Netherlander who was then teaching at the Paarl Gymnasium. In this letter Pannevis pleaded for the translation of the Bible into Afrikaans with a view to the religious instruction of the coloured people. An extensive correspondence on the subject followed, and soon people were pleading not only for Afrikaans as Bible language for the coloured population, but also for Afrikaans as Bible and written language for Dutch-speaking Europeans.

Pannevis was strongly supported by another Netherlander, C. P. Hoogenhout, a teacher at Bovlei, Wellington, who wrote under the *nom de plume* of " Klaas Waarzegger, Jr." In 1873 he published " Die Geskiedenis van Josef voor Afrikaanse Kinders en Huissouwens " in Afrikaans and also started an important series of " Afrikaanse Gesprekke " in *De Zuid Afrikaan*, in which subjects touching the nationality, religion, and language of the Dutch South African were dealt with in a most searching manner.

In July, 1874, the Rev. S. J. du Toit (" Ware Afrikaander ") appeared upon the scene and began to publish, in *De Zuid Afrikaan*, a series of Netherlandish articles, in one of which he advocated the recognition of an Afrikaans written language. In May of the following year, Dr. Brill, rector of the Grey College, Bloemfontein, delivered a powerful speech, in which he pleaded for the proper appreciation of the language of the country.

The correspondence in *De Zuid Afrikaan* was the immediate cause of the meeting and collaboration of the Rev. S. J. du Toit and Mr. Hoogenhout. The result was the founding of the " Genootskap van Regte Afrikaners " at Paarl on 14th August, 1875—a society having for its object the raising of spoken Afrikaans to the rank of a written language. The " Genootskap " began with eight members, and was never a large or wealthy body ; but its members were enthusiastic men with the courage of their convictions, ready to sacrifice fame and preferment on behalf of their ideals. From 1876 onwards they published *Die Patriot*, first as a monthly and later as a weekly paper. Until about 1890 the " Genootskap van Regte Afrikaners " continued to organize and lead the Afrikaans movement and by means of its widely read newspaper and its numerous publications it achieved a great deal, besides creating a desire for reading amongst the masses of the Afrikaans people. After 1890 no more meetings of the " Genootskap " took place ; the financial responsibility for its publications had already in 1878 passed over to the firm of D. F. du Toit, Paarl—the firm which until 1905 printed and published, with a few exceptions, everything which appeared in Afrikaans. This firm also continued the publication of *Die Patriot*, and in 1896 it started an Afrikaans monthly, *Ons Klyntji*, as well. Unfortunately, the Rev. S. J. du Toit, who continued to be closely associated with the firm of D. F. du Toit, became more and more the champion of political views of which the majority of his people strongly disapproved. Especially his attitude in connexion with the Jameson Raid and the Anglo-Boer War of 1899–1902 estranged his countrymen from him, and consequently also from the language movement of which he was the recognized leader. His influence declined considerably after the Anglo-Boer War, and the result was that his two periodical publications had to be discontinued, *Die Patriot* in 1904 and *Ons Klyntji* in 1905. During the last few years before 1905 it was principally the " Uitgesogte Gedigte " compiled by President Reitz, the different volumes of " Grappige Stories en ander Versies " by Melt Brink, and the use of Afrikaans by Advocate J. H. H. de Waal in *Ons Land* (Cape Town) that kept the enthusiasm for an Afrikaans written language alive. When the new or Second Afrikaans Language Movement began, the Paarl was no longer the centre of Afrikaans publications, and even the system of spelling drawn up by the Rev. Du Toit with a great degree of thoroughness and consistency was summarily and finally rejected by the new generation.

During the first period of the Afrikaans movement (1872–1900) there appeared—apart from the periodical publications *Die Patriot*, *Die Afrikaanse Almanak*, and *Ons Klyntji*—about one hundred and twenty Afrikaans works. These were mostly very simple in appearance, nor were the contents primarily intended for the learned. A great deal of the prose was clumsy, and in most of the verses more attention was paid to the rhyme than to the subject-matter. And yet the First Afrikaans Movement was by no means barren of results. The people became familiar with the divergent Afrikaans form of language and they learned to read. It was the very simplicity and absence of embellishment in the language that attracted the unschooled readers ; and although Afrikaans had not as yet received any public recognition, its existence was now a fact that had to be reckoned with. Literary critics may well contend that apart from Lion Cachet's " Sewe Duiwels " (1882–1899), Du Toit's " Koningin van Skeba " (1898), and about half a dozen poems, there is not much of artistic value worth mentioning : but that statement is only a half-truth that does not take into consideration the object of those first writings nor the excellent results they produced. The people as a whole, however, still adhered to the Netherlandish written language, and they succeeded in getting that language recognized in Parliament in 1882 and in the courts of justice in 1884. After 1890 it was particularly the " Zuid-Afrikaanse Taalbond " that exerted itself on behalf of Netherlandish.

After the Anglo-Boer War of 1899–1902 great despondency prevailed for some years and many believed that the end of the traditions and spiritual possessions of the Dutch South African people was in sight. In the matter of language, particularly, the position was critical. Officially the written and school language of the Dutch South African was still Netherlandish ; but such rights as it possessed were only on paper, and in practice it received little recognition or encouragement from the authorities. In some directions determined attempts were actually made to ensure the total disappearance of the language of the Dutch South African. It soon became quite obvious that Netherlandish was swiftly

dying out as a written language, while in many quarters the spoken Afrikaans began to show such a startling degree of English influence that people rightly feared its speedy and complete absorption.

Soon, however, voices were heard pleading for the reconstruction of Africanderdom; political parties were organized, national church schools were founded, and well-organized women's unions started work. The language, naturally, also received attention. At first the recognition of a merely simplified Netherlandish written language was thought of, but soon the national leaders began to realize that the Dutch language could only be preserved by the recognition of an Afrikaans written language. From July, 1903, Adv. J. H. H. de Waal pleaded, in his periodical *De Goede Hoop*, for the recognition of Afrikaans, and he exercised a powerful influence through the publication of his historical novel "Johannes van Wyk." In May, 1905, Jan Hendrik Hofmeyr ("Onze Jan") delivered at Stellenbosch an address on the question "Are We in Earnest?" in which he rebuked the prevailing indifference with regard to the mother tongue, declaring the official equality of English and Netherlandish in the Cape Colony to be a mere fiction. This address of "Onze Jan" was the immediate cause of Gustav Preller, the sub-editor of *De Volkstem*, Pretoria, coming to the fore with his powerful and convincing plea for the acceptance of an Afrikaans written language. While "Onze Jan" still asked "Are We in Earnest?" Preller exhorted his countrymen, "Let us be in earnest." He realized that the sad state of affairs with regard to the language was primarily due to the neglect of Afrikaans. The antiquated armour, Netherlandish, so he maintained, should be laid aside, and the natural weapon, Afrikaans, should be used in the struggle for the national language and national traditions.

About this time the Afrikaans language found other enthusiastic advocates. Amongst these were Johan Visscher and the Rev. W. Postma in the Free State, who discussed the language question in *De Vriend* (Bloemfontein); D. P. du Toit, who was directly influenced by the First Afrikaans Movement, and who worked strenuously for Afrikaans in his paper *De Middellandsche Afrikaner* (Cradock); J. H. Malan, who edited *De Re-Echo* (Humansdorp) and who strongly advocated the use of Afrikaans as a written language; Eugène Marais, who had since the nineties published leading articles in Afrikaans in his paper *Land en Volk* (Pretoria); and J. S. M. Rabie, who as editor of *De Afrikaner* (Pietermaritzburg) pleaded in Natal for the recognition of Afrikaans.

The result was a heated controversy in the Press and on public platforms on the possibility of an Afrikaans written language, and it soon became clear that the new movement had not only youth and enthusiasm on its side, but also learning and ability. In December, 1905, the "Afrikaanse Taalgenootskap" was founded at Pretoria; in November, 1906, the "Afrikaanse Taalvereniging," at Cape Town; and in the beginning of 1907 an "Afrikaanse Taalgenootskap" was also started at Bloemfontein. The "Afrikaanse Taalvereniging" in particular exerted a powerful influence and did not scruple to deliver vigorous attacks even on prominent Dutch South Africans like Dr. W. J. Viljoen, who was still pleading for the Netherlandish language. By 1908 the protagonists of Netherlandish began to realize that it was essential to come to an understanding with the advocates of Afrikaans, and that it was in the interests neither of Netherlandish nor of Afrikaans to range the two in opposite camps.

Original works of high artistic merit began to appear in Afrikaans—e.g. "Die Vlakte" (1906) by Jan Celliers, "By die Monument" (1908) by Totius, "Oom Gert Vertel en Ander Gedigte" (1911) by C. Louis Leipoldt. Dr D. F. Malan in 1908 made a speech bearing the title "We are in Earnest," and the "Afrikaanse Taalvereniging" regulated the spelling. In 1909 the South African Academy for Language, Literature, and Art was founded for the express purpose, amongst others, of maintaining and furthering both forms of the Dutch language. The Academy prescribed rules for the spelling of Afrikaans in 1915 and again in 1918. In 1910 was started *Die Brandwag* (Pretoria), in 1914 *Ons Moedertaal* (Paarl), and in 1916 *Die Huisgenoot* (Cape Town)—periodicals which all strongly advocated the recognition of Afrikaans and which supplied the people with Afrikaans reading matter on almost every subject. The years from 1905 to 1914 were the real years of strife during the Second Period of the Afrikaans Language Movement. It is impossible to describe this strife here in detail, or to enlarge on the rôle that the different leaders played in political, ecclesiastical, educational, scientific, or other directions.

In April, 1914, came the first official recognition. On the proposal of C. J. Langenhoven, the Provincial Council of the Cape resolved to allow Afrikaans as medium in the primary schools, up to and including Standard IV; in June 1914 the Provincial Council of the Free State resolved to admit Afrikaans into their system of education; and that same month the Provincial Council of the Transvaal took a similar resolution. Langenhoven thereupon delivered a lecture before the Academy upon "Afrikaans as Medium of Instruction" and pressed for the proper carrying out of the resolutions of the Provincial Councils. For a short while opposition again became active; but the propaganda work was strenuously continued, and Afrikaans had finally triumphed in the school. In 1919 the Provincial Council of the Cape resolved that Afrikaans could be used both as medium and subject right through the school up to Matriculation.

In 1919 chairs in Afrikaans were established at the Grey University College, Bloemfontein, and at the University of Stellenbosch, and subsequently also at other university institutions. At the University of Stellenbosch and at the University Colleges at Bloemfontein and Potchefstroom the majority of subjects are to-day taught through the medium of Afrikaans.

In the Church, too, one success followed upon the other. The Reformed Church ("Gereformeerde Kerk") was the first to acknowledge Afrikaans as official Church language, and in 1916 the Dutch Reformed Church ("Nederduits-Gereformeerde Kerk") of the Free State, as well as that of the Transvaal, followed suit. In 1917 the Church Council ("Raad der Kerken"), a body on which all Protestant Dutch Churches are represented, realized that Netherlandish would never become the spoken language of the South African Dutch people, but they still hesitated to recommend the immediate acceptance of Afrikaans; in 1919, however, the majority of the Church Council were in favour of Afrikaans as Church language, and that same year the Cape Synod resolved to recognize Afrikaans as official Church language. Immediately thereafter arrangements were made for the translation of the Bible into Afrikaans; and a committee of translators have now for several years been occupied with this task. In 1924 the Cape Synod again declared itself most emphatically in favour of Afrikaans as official Church language. Religious works in Afrikaans have become quite common, and metrical versions of a number of psalms and hymns have been published.

In 1918 the Union Parliament decided to recognize Afrikaans as official language for all official purposes, except in Bills of Parliament, laws, and official documents of either House of Parliament, for which purposes Netherlandish had still to be used. But in May, 1925, it was resolved at a joint sitting of both Houses of Parliament to amend the language clause of the Act of Union in such a manner as to recognize Afrikaans everywhere and for every purpose as one of the official languages of the Union.

The Afrikaans language thus enjoys complete official recognition to-day, at least on paper. In a few years' time it gained ground tremendously, and it is to-day practically the only form of the Dutch language which is studied and written by Dutch South Africans. Nearly all newspapers and periodicals intended for the Dutch-speaking population appear in Afrikaans, and sneering at the impotence and poverty of this "peasant dialect" is a thing of the past. It possesses a fixed spelling and a literature which, though limited in extent and young in age, has compelled the respect and admiration of competent judges even in Europe. Prose writers such as Langenhoven, Leon Maré, and Sangiro, and poets like Celliers, Totius, and Leipoldt, have demonstrated to the world what Afrikaans is capable of. The most distinguished Netherlandish scholars in the fields of language and literature enthusiastically welcome the new language so closely related to their own and do all within their power to encourage and support it. The vast majority of the English-speaking population are no longer hostile to the second language of the country, and their children study it at school. The Government is sympathetic and is financially supporting the compilation of a large Afrikaans dictionary.

Every one who has any knowledge of the South African language conditions will agree that the recognition of Afrikaans was a necessary and just act. The future will yet have to show how the Dutch-speaking South African will use his new possession for developing himself and his country; but the first results give us good reason to expect that a great deal of good will be achieved when once a generation has arisen which has enjoyed the privileges of real mother-tongue instruction in youth. The principle of bilingualism, too, which is laid down in Section 137 of the Constitution of the Union, and which has repeatedly proved to be a necessary condition for the development of a united and contented South Africa, has obtained a new meaning since the coming of Afrikaans; it is now, with a generally known language, certainly much easier for heads of Government Departments and public leaders to apply that principle in an honest and unambiguous manner, for it is now no longer necessary to struggle along with the clumsy Netherlandish translations of Dutch South Africans or with the less easily understood Netherlandish of Netherlanders. Given mutual good will and a spirit of co-operation, the use of Afrikaans will undoubtedly contribute in a great measure to the satisfactory solution of the difficult and complicated problem of bilingualism. If this be the result, then the recognition of Afrikaans will indeed be an event of first-rate importance in the history of South Africa.

§ 5. Honours held in connexion with the Union.

Lists were given in previous issues of the *Year Book* (Nos. 1 to 7) of honours held in connexion with the Union and honours conferred for military service during the European War. These lists are not repeated owing to considerations of space. During the second session of the fifth Parliament, a resolution was approved of by the House praying that His Majesty the King refrain from conferring titles upon his South African subjects. No honours were therefore conferred during the year 1925. Military honours are recorded in Chapter X.

§ 6. The Capital Cities of the Union.

Under the *South Africa Act,* 1909, it is laid down (Section 18) that Pretoria shall be the seat of Government and (Section 23) Cape Town the seat of the Legislature of the Union, thus practically establishing a system of two capitals, though the Act does not describe either city under that term. Under this arrangement the headquarters of the various Departments of State with their staffs are placed in Pretoria ; while the Houses of Parliament and the Parliamentary Establishment are situated in Cape Town. In terms of Section 94 of the *South Africa Act,* the seats of the Provincial Governments are fixed respectively at Cape Town, Pietermaritzburg, Pretoria, and Bloemfontein.

Previous issues (Nos. 1 to 5) of this *Year Book* contained particulars of the history and development of these cities.

§ 7. Geological Structure of the Union.*

A.—PHYSICAL FEATURES.

The Union of South Africa is divided into an interior plateau and a diversified tract of country between it and the ocean on the east, south, and west; the escarpment which separates the two regions is the Drakensberg of the Transvaal, the Drakensberg or Quathlamba of Natal and the Transkei, the Stormberg of the north-eastern Cape Province, the Sneeuwberg, Nieuweveld, Komsberg, Roggeveld, Bokkeveld, and Kamiesberg farther south and west, and it is continued northwards under less well-known names to beyond the Cunene River. The highest parts of the country are generally on or near the edge of the escarpment; it is only in the south, where the Cape ranges lie, that the ground between the escarpment and the coast rises in places to greater heights than on the escarpment itself. Though the highest point in the sub-continent (Giant's Castle) is only about 10,880 feet above sea-level, some 40 per cent. of the Union is included within the 4,000-feet contour, and most of this elevated country lies on the interior plateau.

The plateau is generally a country of great plains from which rise flat-topped hills of irregular plan, for it is chiefly made of nearly horizontally bedded shales and sandstones and sheets of dolerite, varying in the resistance they offer to denudation; but where these flat rocks (Karroo beds) have been removed, as in the northern and central Transvaal, Griqualand West, Prieska, Kenhardt, and Namaqualand, the older rocks usually appear in ridges or plains according to the attitude of their beds, or in irregular plains and craggy hills where they are extensive igneous intrusions.

The interior plateau can be divided up into several regions more or less sharply defined from each other by the shape and character of the surface and the climate. The number of these regions can be increased by narrowing the range of characters considered to be distinctive of each, but most of those adopted here are commonly recognized as convenient units. The surface characters are the results of past geological events and climate, but although references to some of these events will be found in this and the succeeding geological section, limits of space forbid a full discussion here, and our knowledge is very deficient on many questions of importance connected with the evolution of the sub-continent. The following is a list of the plateau regions:—

1. The High Veld.
2. The Basuto Highlands.
3. The Upper Karroo.
4. The Namaqua Highlands.
5. The Kalahari and Bushmanland.
6. The Kaap Plateau.
7. The Middle Veld.
8. The Bushveld.
9. The Limpopo Highlands.
10. The Low Country (including much country below the escarpment).

1. **The High Veld.**—High Veld includes the southern Transvaal and a large part of the Orange Free State. It has an invigorating climate, with a rainfall of from 20 to 35 inches. Lying for the most part over 5,000 feet above sea-level, it is perhaps the most favourable region in the Union for a white population. It happens that the Witwatersrand is in it, and the grand climate of the Witwatersrand, where excessive heat is never experienced, is of very great importance to the mining industry. The country generally has an undulating surface, which becomes flatter, or more varied by steep-sided flat-topped hills, as one travels westwards towards drier regions. Sheep, cattle, and mealies are the chief farm industries. It is essentially grass country, and the protection required both from the summer sun and the cold winds of winter is as yet inadequately provided by trees planted in coppices and wind-breaks. The streams are often perennial. Pans are an anomalous feature, for they can hardly have developed under present climatic conditions. The Lake Chrissie group of pans, for instance, has reached a further stage of development than those in other parts of the plateau, though they are in an area with high rainfall; they were probably formed during a drier period than the present.

2. **The Basuto Highlands.**—The Basuto Highlands are much more mountainous than either the High Veld or the Upper Karroo. The region is made of the upper groups of the Karroo formation; the upper streams of the Orange River System have eroded deep valleys in the surface, and the pale Cave sandstones capped by dark basaltic flows give character to the region. These rocks make a type of scenery here which is in the strongest possible contrast to that formed by them in the Springbok Flats of the Transvaal Bushveld, where the rocks rarely crop out from the sandy ground. The contrast is due to the difference of altitude above the outlets of the rivers draining the two regions; in Basutoland the rivers are actively cutting down their beds, and the local differences in height are as much as 5,000 feet, while the Nyl and Olifants Rivers from the Springbok Flats meet the hard rocks of the Limpopo Highlands within a short distance of the Flats, where the rocks have

* Contributed by A. W. Rogers, Sc.D., F.R.S., Director of Geological Survey.

disintegrated faster than the streams can carry away the sand, and the local range in height from river beds to the highest points is scarcely over 200 feet. The region has a high rainfall, but the steep slopes and the destruction of bush make it the most prominent example in South Africa of the dominance of erosion over deposition.

3. **The Upper Karroo.**—The Upper Karroo is not sharply defined from the High Veld in the Orange Free State; it has a wide range in rainfall, from less than 5 to 25 inches, and small bush becomes the most constant type of vegetation. Plains, from which rise flat-topped hills boldly scarped by sandstone and dolerite sheets, are the characteristic type of scenery, and can be seen from the railways in the Cape north of the escarpment and in southern Free State, while rough dark ridges, the outcrops of inclined sheets of dolerite, are occasionally seen traversing the country for many miles. This is the region most affected by severe droughts and their attendant evil of soil erosion due to overstocking, the destruction of veld consequent on the limited number of watering-places and the kraaling of sheep necessitated by the existence of jackals. The streams are intermittent; the soil is thin, except in the alluvial tracts in the valley bottoms, and surface-limestone becomes an important feature in the drier parts of the region. Pans are abundant, and in the low-grade valleys of the north-west the wide "vloers" of Carnarvon and Calvinia, more or less well-defined flat areas a few miles wide, thinly covered with brackish silt, are a striking feature. Pans are specially abundant near the limits of the Karroo beds, the easy destruction and flat bedding of which have facilitated their formation by wind. Owing to the great range in rainfall and altitude (2,000 to 6,000 feet) there is considerable diversity of conditions in this region. While the north-western parts are little better than desert, the more favoured areas to the south and east are well covered with permanently occupied farms, though agriculture is restricted to the alluvial tracts.

4. **The Namaqua Highlands.**—The Namaqua Highlands are part of the rocky western edge of the plateau; with scanty soil and low (5 to 15 inches) rainfall, they afford little scope for agriculture. Short perennial streams are found in the Kamiesberg, but the mountainous country enclosed by the great bend of the Orange River is very dry, as is also its continuation in South-West Africa. Copper mining has been an important industry since the fifties of last century.

5. **The Kalahari and Bushmanland.**—The Kalahari and Bushmanland are separated by the deep rocky valley of the Orange River, but they are alike in having a low rainfall (5 to 10 inches), practically no surface water and a thick covering of sand through which rise hills of the island-mountain type, i.e. hills with straight and steep profiles with an abrupt change of slope at the base. The rivers are channels through which water passes from less arid country to the east; they rarely receive local additions, and the Orange River is the only one that always contains water. Grass is the predominant vegetation, and it is doubtless nourished by the water held by the sand into which the rain sinks rapidly. There are no quantitative observations on the run-off in this region, but it must be extremely small. Only on the western edge is there hard-veld in which small bush, like that of the Karroos, dominates over grass. There is good grazing after rain, and the feeding qualities of the grass persist through the droughts, but the region is essentially trek-veld unfitted in general for continuous occupation.

6. **The Kaap Plateau.**—The Kaap Plateau lies between the Kalahari on the west and the Campbell Rand, an escarpment flanking the right side of the Dry Harts-Vaal valley on the east. Though the Kaap Plateau would be a better unit if the term were restricted to the limestone plateau between the Asbestos-Kuruman range and the Dry Harts-Vaal valley, it is customary to include the Langebergen as well as the Asbestos-Kuruman hills in it, and the region thus defined ranges in height from about 4,000 to rather over 6,000 feet above the sea, has a rainfall of from 5 to 20 inches, and its character presents considerable variety. The great limestone plain on the east, together with similar but smaller plains between the Langebergen and Asbestos-Kuruman hills, have extensive underground drainage, and the Kuruman spring is one of the largest in the country. The great quartzite range of the Langebergen and the similar but less conspicuous Korannabergen on the edge of the Kalahari to the west are the most marked ranges made of hard folded strata in the north of the Cape Province, and, in contrast to the Langebergen of the south of the Province, they owe their present existence to having been exposed by the removal of the Karroo formation under which they were once buried. The southern ranges are of much later date (late Karroo or post-Carboniferous), for the basal Karroo beds, which in the northern Langebergen (and also in the Asbestos-Kuruman hills) are still represented by undisturbed flat-bedded outliers, were completely involved in the great crustal movements which gave rise to the southern ranges.

7. **The Middle Veld.**—The Middle Veld stretches from the valley of the Vaal River near its confluence with the Orange north-eastwards through the Transvaal; it includes only a fringe and outliers of the Karroo beds. The pre-Karroo landscape in this region has been almost completely exposed, and has apparently suffered little change since the

removal of the Karroo beds. The chief hill ranges in this old landscape are the Magaliesberg and Gats Rand, and the extensive plains of the western Transvaal made of the Ventersdorp beds are of equal age. The dolomite country of Pretoria, Rustenburg, Marico, and Lichtenburg is noted for the underground drainage and apparently capricious behaviour of streams usually found in such a region. The region has a great range of soils on account of the variety of rocks on which they lie, the dolomite, the shales and ferruginous beds of the Pretoria series, the quartzites of the latter and of the Black Reef and Witwatersrand System, the Ventersdorp volcanic rocks and the intrusive diabase sheets, the granite and schists, and the outliers of the Karroo beds. The diamond-bearing gravels in the Vaal River valley and the most important productive diamond-bearing "pipes" are in this region. The rainfall average ranges from 15 to 30 inches, and the country lies between 3,000 and 6,000 feet above the sea, presenting a considerable variety in its vegetation and scenery, from the wide grass flats with scanty scrub of the west to a type approaching that of the Bushveld in the east. The iron ores on which the hopes of a future iron industry of South Africa are based occur in this region, though they are not confined to it.

8. **The Bushveld.**—The Bushveld is the flat and undulating country in the central Transvaal surrounded by roughly concentric ridges made of lower and lower strata of the Transvaal System as one proceeds outwards to the north, east, south, and west from the Bushveld, which is itself made of the remarkable igneous intrusions called the Bushveld Complex, overlain in places, especially in the Springbok Flats, by thick outliers of Karroo beds. It lies between 2,500 and 6,000 feet above sea-level, and has a rainfall average of from 15 to 25 inches, but the north-eastern corner, about M'Phathlele's Location, would seem from its Karroo-like vegetation and abundant surface-limestone, to have less rain than the rest; in that corner, also, hills of the island-mountain type are conspicuously developed, though this kind of hill is seen near the southern limit of the Bushveld in the Pyramids just north of the Magaliesberg. Towards the east the Bushveld has massive ridges and hills made of the acid and basic rocks of the Complex. The rivers leaving the Bushveld have to traverse very resistant rocks of the Transvaal and Waterberg Systems, and their grades above the poorts or valleys in those formations are comparatively low, so there has long been an accumulation of sand within the area, and there are large tracts of black "turf" containing much organic matter in the valleys with lowest grades. Two other remarkable features in the Bushveld must be mentioned, the great group of island-mountains called Pilandsberg, made of peculiar volcanic rocks and intrusions of related kinds, and the Pretoria Salt Pan, a volcanic neck encircled by granite hills, and lying 200 feet below the surrounding country. The Pilandsberg is a very old feature, certainly of pre-Karroo date, while the Salt Pan has been shown to be of post-Karroo age.

9. **The Limpopo Highlands.**—The Limpopo Highlands are a composite region which includes very different areas, the Transvaal Drakensberg, the Waterberg, the Pietersburg plateau, and the Zoutpansberg. The contrast between the forests of the Mist Belt on the east or the isolated forest near Hangklip on Zoutpansberg and the thorn scrub of the Pietersburg plateau is very great, and reflects the great range in average rainfall, 15 to 70 inches, while the altitude above the sea ranges from 3,000 to over 6,000 feet. The highest ground is made of quartzites of the Transvaal and Waterberg Systems, and the lower of granite and outliers of the Karroo formation. The great gorges cut by the rivers draining the Bushveld and the eastern parts of the Middle and High Veld through the eastern quartzite rampart afford magnificent scenery, while the western edge of the region in the Waterberg flats resembles the neighbouring Kalahari in being a sand-covered area traversed by rivers fed chiefly from without. The Waterberg flats grade into the Kalahari on the west and the Low Country of the Limpopo valley on the north.

10. **The Low Country.**—The Low Country ranges from 500 to 3,000 feet above sea-level. The great escarpment abuts on the southern flank of the Zoutpansberg, which continues past it into the northern continuation of the Lebombo flats, where it disappears under Karroo rocks, so that the Low Country extends from the Waterberg flats down the Limpopo Valley, round the eastern end of Zoutpansberg, into the eastern Low Veld. The Low Country is unhealthy and the rainfall varies from 50 to 70 inches in places on its western limit on the escarpment to 15 to 25 inches in the east and in the Limpopo valley. Made chiefly of granite and schists, the harder portions of which form island-mountains such as the Murchison Range, the Limpopo valley itself has below the junction of the Njelele River, large areas of Karroo beds and limburgite and basic soda-rich lavas probably of post-Karroo date. The Lebombo range on the east is made of Karroo rocks, sedimentary and volcanic, dipping seawards.

The country between the escarpment and the ocean is considerably smaller than the interior plateau, but as regards climate and structure it presents as much diversity. The outstanding difference in structure is due to the existence of the Cape ranges, folded mountains of late Karroo age, whereas in the plateau region all the folding took place in very much earlier—probably pre-Cambrian—times, and the late or post-Karroo earth-movements were either widespread and vertical or, in a few regions, local and vertical. The axes of folding

in the Cape ranges do not follow closely the curve of the escarpment, nor are they parallel to the coast, but it is obvious that these three great physical features are to some extent interrelated. The country below the escarpment can be conveniently sub-divided into the following regions :—

11. The Great Karroo.	13. The Folded Belt.
12. The South-eastern Region.	14. The Coast Belt.

11. **The Great Karroo.**—The Great Karroo is the dry country (average rainfall from less than 5 to 15 inches) between the escarpment and the Folded Belt. Its eastern limit is ill-defined, but may be placed on the Sundays River, beyond which the rainfall increases towards the north-east and the Cape ranges disappear, so that the slope to the coast is not broken by a defined mountain range. The region lies between 1,000 and 4,000 feet (Klein Roggeveld) above the sea. The driest parts are the Tanqua Karroo on the west and the Ghoup (or Gouph), the valleys of the Dwyka and Gamka Rivers, in the central part. The region is immediately underlain by the lower half of the Karroo formation ; thin soils and rock-strewn surfaces between outcrops of sandstone and shale are characteristic. The alluvial soils along the rivers are very fertile where protected from the accumulation of salts. Defined pans are not found in the region, but on the shale flats there are irregularly bounded bare areas covered with a brak silt, which may be regarded as pans in process of formation. The vegetation is drought-resisting scrub ; grass appears only in exceptionally wet years. The Great Karroo has gradually become occupied since the early years of the nineteenth century ; before that time it was regarded as a desert unfit for man or beast, but well-sinking and donkey transport have bettered the conditions.

12. **The South-eastern Region.**—The South-eastern Region consists of the seaward slope of the escarpment from the Graaff-Reinet district north-eastwards to the southern limit of the Low Country. At the western end the Folded Belt lies between it and the coast, but the Cape ranges are finally cut through by the coast near the mouth of the Great Fish River, and beyond that neighbourhood the Lower Karroo beds reach the coast unfolded for many miles, but, in a small tract at the Umgazana mouth, inclined Stormberg beds lie on the coast south of an east and west fault, and in eastern Pondoland the Lower Karroo beds dip towards the shore at considerable angles. Farther north in Natal a wide belt of pre-Karroo rocks appears along the axis of a low anticline flanked on the coast side by remnants of Karroo beds. In the interior of the region the country is terraced by thick dolerite sheets and massive sandstones, and remarkable intrusions related to the Karroo dolerites but more bulky and with a wider range in composition form the Ingeli, Tonti, Insizwa, and Mount Currie. The rainfall increases (from 15 to 40 inches) towards the north-east, and the streams become more and more permanent in the same direction. The rivers in general have steep grades, but there are numerous instances of long stretches of low grade with " cut-offs " and meanders above falls or rapids on thick sandstones or dolerite sheets, and the valleys are usually deeply entrenched in the terraced landscape. Grass is the characteristic vegetation, but in the south-west there is a transition to Karroo scrub, and forest or thick bush become conspicuous in the valleys towards the north-east.

13. **The Folded Belt.**—The Folded Belt embraces the mountain ranges in the south of the Cape Province and the wide valleys between them. The Cape ranges owe their existence primarily to the earth-movements of late Karroo times, but they are made of the harder, more weather-resisting portions of the very thick (probably at least 20,000 feet) body of strata known to have been involved in the folding, so these ranges have quartzitic rocks on the surface and sandy soils poor in lime and clay. The valleys are mainly in the synclines, predominantly shales of the folded formations and shales and conglomerates of the Cretaceous beds which were deposited unconformably on the folded rocks ; but extensive tracts of pre-Cape slates, granites, and limestones appear in the cores of certain anticlines and on the west from under the less disturbed flank of the folded rocks. The region ranges from near sea-level to 7,627 feet in the Seven Weeks' Poort Mountain on Zwartberg, and it presents as great or even greater variety in soil and climate than any other of the regions into which the country is here divided. The Little Karroo of Ladismith (Cape) has a considerable resemblance to the Ghoup, though made of the Bokkeveld beds instead of Karroo strata, for it has a very low rainfall, while close at hand on the south is Tradouw Berg with wet climate, sour soil, and the stretch of forest called Grootvader's Bosch on its southern flank. The mountains on the west trend north-north-west, and their folds flatten out in that direction ; where these rocks are cut by the coast and the lower reaches of Olifants River they are inclined at very low angles. Possibly the inland axis of Cedarberg is represented farther north by the edge of the escarpment of Kamiesberg, and, if so, this is the only region where the escarpment and folded belt coincide, but the amplitude of the fold has decreased so much that denudation has removed the most obvious kind of evidence required to substantiate its existence there. Near Karroo Poort the east-west folds make their appearance and from thence eastwards the numerous axes are, in plan, wide curves concave to the south, and, in general, the height of the mountains above

sea-level decreases until they reach the south-eastern coast. The closest folding is probably in the Zwartberg region, but towards the east the region where the folds flatten out is covered by the sea. A striking feature in the Folded Belt is due to the former existence of a plain or plains sloping towards the nearest large rivers or the sea from various heights up to about 2,500 feet above the sea; rough mountains rose from this ancient plain, the remnants of which are seen as a fringe on their slopes and as tablelands separated from the terraces by deep valleys. This great plain extended at least from the Albany district westwards as far as the Breede River valley and the Ceres Karroo, and it was of post-Cretaceous date. The climate of the Folded Belt ranges from almost that of a desert (near Prince Albert and Karroo Poort) to one with over 70 inches of rain about the sources of the Berg River. The south-western and southern rivers rising in the mountains are perennial, but the great rivers from the escarpment, the Sunday, Gamtoos, Gouritz, and Tanqua, may become a series of pools in times of drought; they receive insufficient water in their courses across the Folded Belt to maintain a constant flow at all times.

14. **The Coast Belt.**—The Coast Belt varies greatly in width and character. In the north-west it is continuous across the Orange River with the Namib of South-West Africa, which is the only true desert in the country; though the rainfall is low (average of 2·17 inches at Port Nolloth) the heavy sea fog on that part of the coast maintains a fairly thick cover of bush on the sandy ground. Towards the south and east the rainfall increases steadily, except for the marked inversion at the Cape Peninsula, as far as the George-Knysna districts; beyond that area of heavy fall it drops sharply near Algoa Bay and rises again towards Durban, where the coast assumes tropical characters. The coast generally is low and shelving or the shore may be backed by low cliffs behind which the ground rises gradually. Great cliffs fronting the sea are only found round the Cape Peninsula (800 feet at Cape Point), and less conspicuous cliffs occur north of Port Nolloth, near Strand Fontein, Baboon Point, and near Saldanha Bay on the west coast, and to the east near Hermanus, Cape Infanta, Cape St. Blaize, George, and Knysna, and on the coast of Pondoland. The west coast is remarkably straight from the Orange River to St. Helena Bay, and again from Algoa Bay to Portuguese territory on the east; the south coast has headlands such as the Peninsula, and the Capes Agulhas, St. Blaize, and St. Francis, made of hard Table Mountain Sandstone, but they afford little protection to ships, and the only good natural harbour on the coast is Saldanha Bay, which is probably a drowned valley. Drowned valleys at the mouths of rivers are marked features of the straight portions of the coast, but they have sand bars and are only available for ships when they are kept open by dredging.

The rivers of the Union can be grouped in three great classes: (*a*) those draining the interior plateau, (*b*) those taking their rise on the escarpment or on the slope to the sea below it, and (*c*) those rising in the Folded Belt. Some features observed in them have been mentioned in the description of the several geographical regions.

(*a*) All the drainage from the interior plateau eventually reaches the ocean by way of the Orange or Limpopo Rivers. The Orange River drains by far the largest catchment in the country (some 261,000 square miles, including the Nossob and Auob), and the fact that its mouth is closed for months at a time is a comment on the rainfall; it must be remembered that below the confluence of the Vaal River (over 600 miles from its mouth) the Orange receives practically no water during the greater part of the year, and that the river is thus in the main a channel carrying water from a region with an average of over 20 inches of rain through an arid country to the sea. The river goes over a fall of some 400 feet at Aughrabies, 300 miles from the mouth, and rapids occur to within 25 miles of the mouth. The high grade thus indicated is characteristic of all the South African rivers, though the Orange is the most striking example. The Limpopo, though it has a much smaller catchment, has a wider valley and lower grade; it reaches the 2,000 feet contour 530 miles from the coast, while the Orange reaches the same level 300 miles up its valley. The Limpopo is joined below the escarpment by the Olifants River, which drains a large part of the Bushveld and has an independent valley through the escarpment.

(*b*) The rivers rising on the escarpment are largest and most constant in the east, where the Tugela is the most important of them. The characters of their valleys have been mentioned in the description of the South-eastern region. The rivers which rise on the escarpment between the Sneeuwberg and Roggeveld cross the Folded Belt by a series of great poorts. Beyond the Sneeuwberg the rivers run only for a short time after rain.

(*c*) The chief rivers which have their origin in the Folded Belt are the Berg, Breede, and certain tributaries of the Gouritz, Gamtoos, and Sundays Rivers. They are in the main in longitudinal valleys following the strike of the rocks as contrasted with the transverse rivers draining from the Karroo.

The escarpment which bounds the interior plateau is by far the most important orographical feature in the country, and its significance as regards the geological structure and history of South Africa will be briefly discussed in the third portion of this article.

Its chief human interest is in the hindrance it offers to roads and railways. The most important mountain ranges of Alpine type, and also the youngest, are those of the Folded Belt; the older ranges of the same type, the Langebergen and Korannabergen in the north, are the comparatively recently exposed remnants of very ancient chains.

The Funduzi, in Zoutpansberg, is the only body of water in the Union that can properly be called a lake. According to Mr. T. G. Trevor, who visited this little-known spot in 1917, it is 3,000 yards long and is the result of the damming up of a valley by a landslip. The other closed depressions are shallow pans, which are most abundant in those parts of the interior plateau where the Karroo formation lies nearly flat and is being stripped from the older rocks by denudation, but they occur in other parts of the plateau and also on the coast belt. They owe their existence to various circumstances, but the action of the wind, under favourable conditions of rock-structure and weathering, is probably the most potent factor in their production. The largest pans are some 100 square miles in area.

B.—GEOLOGY.

The stratified rocks which build up the territory of the Union have been divided up into the systems, and subordinate groups, tabulated on page 39, and in this table there is a statement of the chief earth movements and phases of igneous activity so far recognized as having affected this country during the period represented by the succession of sedimentary rocks.

There is still much uncertainty on some of the main points in the geological record in South Africa, especially in the correlation and determination of the relative age of the more ancient sediments and of the great intrusions of granitic rocks in them. Up to the present time no fossils older than those of Devonian age have been determined from South Africa, and therefore it is from the structure and characters of the rocks themselves that the history of the greater part of the South African strata has to be deciphered.

Beds of proved marine origin are restricted to the margin of the sub-continent, and they are thin compared with the great deposits lacking fossils of marine habit, and, in the case of the Karroo system, abounding in evidence of deposition under fresh-water or continental conditions.

Owing to the want of fossils in the rocks older than the Bokkeveld (Devonian), there is no means of determining the base of the Palaeozoic in South Africa, and that horizon known as the Cambrian, and recognized in the other continents as one of the most important geological benchmarks, has therefore not been recognized here. This circumstance makes a local nomenclature of the older rocks necessary, because the use of such terms as Archaean or Algonkian, which are widely used elsewhere, is not strictly correct for any South African rocks, and the well-known lower Palaeozoic systems of other continents cannot be identified at all.

The *Swaziland system* comprises all sedimentary and volcanic rocks older than (or supposed to be older than) the Witwatersrand beds. According to some authors, all rocks in the country older than that formation should be grouped in this system, but the inclusion of granite and orthogneiss is not in harmony with the rest of the stratigraphical nomenclature used in South Africa. Proved intrusive rocks are therefore excluded from the Swaziland system as from the others. There are highly altered rocks of which the original characters are not known, such as certain granulites and schists in the Kheis series, and these will be placed in the system for convenience. Owing to the restricted range of beds generally acknowledged to belong to the Witwatersrand system, the proper test of age is in fact rarely applicable. Some geologists, such as Dr. Molengraaff, to whose work Transvaal geology owes much, recognize altered Witwatersrand strata in rocks here classed in the older system; while others regard the intrusive relation of microcline-granites and gneiss, which in the Witwatersrand area are older than the Witwatersrand system, as decisive in showing that the beds invaded are of pre-Witwatersrand age. This evidence of age can only be accepted in the immediate neighbourhood of recognized Witwatersrand strata, and it does not carry weight in distant areas such as Barberton or Prieska. Thus it becomes clear that the Swaziland system is a convenient class into which very old strata can be placed till satisfactory evidence of their age is found. The system is not comparable with any of the others adopted in South Africa, and the correlation of the various series described below is uncertain.

Moodies Series is the name given to a group of conglomerates, slates, and banded ironstones in the Barberton district, Mount Maré in Pietersburg, and in the Wakkerstroom and Piet Retief districts. Over large areas these beds have been altered by shearing and by acid and basic intrusive igneous rocks; andalusite and ottrelite-schists are abundant, while garnet, sillimanite and corundum are amongst the new minerals in the contact zones, and tourmaline extends through a great vertical range at Mount Maré. The *Jamestown series* in Barberton is described as a group of basic schists, chiefly intrusive, with which are

associated belts of altered sediments and volcanic rocks. The *Onverwacht volcanic series* of the same district consists of basic amygdaloids, quartz-porphyries, tuffs, and perhaps altered dolomites.

In Vryheid, Utrecht, Piet Retief, and the Nondweni district of Natal, there are sedimentary rocks which have been invaded by granite older than the Transvaal system. They contain gold-bearing conglomerates and beds which resemble some of those in the Witwatersrand system, and it has been suggested that they are part of that system. They have also been placed in the Swaziland system, and at present their correlation is a matter of doubt. The best known of these rocks is the *Pongola series*, divided by Dr. Humphrey into a lower group of quartzites, phyllites, and amygdaloidal lavas, and an upper group of shales, quartzites, and conglomerates. North of the Assegai River the amygdaloid below the sedimentaries is underlain by granophyre and gabbro into which granite intrudes.

In the divisions of Prieska, Kenhardt, and Gordonia, there is a great group of sedimentary and extrusive rocks known as the *Kheis series*. It is divided into three sub-groups, the Marydale, Kaaien, and Wilgenhout Drift beds, which apparently follow each other conformably upwards in the order named. Gneiss is in intrusive contact with all three sub-groups, and large bodies of the Marydale and Kaaien beds lie entirely surrounded by granite and gneiss. The Marydale beds consist of arkose, lavas of acid and basic compositions, tuffs, quartzites of various kinds including some with very much magnetite in them, limestone, and various schists and granulites. The original nature of some of the granulites is proved by the presence of amygdaloidal structure, but others are of doubtful character. The variety of new minerals developed in these beds is great. Amongst them are pyroxenes, amphiboles, garnet, sillimanite, cyanite, staurolite, and various lime silicates. The Kaaien beds are quartzites and quartz-schists chiefly, and they form the prominent range of hills on the Prieska–Kenhardt boundary, as well as Scheurberg in the Kalahari. The Wilgenhout Drift beds include slates, acid and basic lavas and tuffs, quartzites and limestones.

The *Kraaipan series* of Bechuanaland is older than the Ventersdorp system, but it has not been found to be penetrated by granite or gneiss. It is composed of banded magnetic quartzites, jaspers, various schists, limestones, and altered acid and basic lavas. The very similar beds of Abel's Kop and Goudplaats described by Dr. Jorissen are traversed by offshoots from the neighbouring granite.

In Gordonia and Namaqualand there are many lenticular masses of schists and quartzites in the gneiss. Sillimanite and garnet are often conspicuous in these rocks, and biotite and cordierite are usually present.

Granite and gneiss posterior in age to the *Kheis series* and to the rocks which are represented by the fragments of schists in the Namaqualand and Bechuanaland granites cover an area of many thousand square miles in the north of the Cape Province and the adjoining part of the Transvaal. They are quartz-microcline-orthoclase-biotite rocks as a rule. Amphiboles and pyroxenes are rare. Porphyritic granites are not often seen; pegmatites are abundant. The granites and gneiss of the northern and north-eastern Transvaal, as well as those of the country immediately north of the Witwatersrand, are quartz-microcline-plagioclase-biotite rocks generally, and are distinguishable from the much younger granite of the Bushveld.

A later, but probably pre-Transvaal, group of intrusive rocks is the Palabora Complex of granite, syenite and pyroxenite, which invaded the older gneiss and Swaziland beds of the Murchison range.

An important and interesting feature in the granitic areas north of Pietersburg and in the Low Veld is the abundance of corundum in pegmatites intrusive in ultra-basic magnesian rocks.

In Namaqualand, a group of small intrusions of rocks, varying from quartz-rocks to nearly pure magnetite, and including pyroxenite, norite, diorite, and anorthosite, is of later age than the gneiss and schists, and probably older than the Nama formation. They are of importance on account of the apparently syngenetic copper ores in them.

The *Witwatersrand system* is found in the southern Transvaal and the adjoining part of the Orange Free State, and it is probably represented by certain beds (Pongola series and others) in Natal, though the question is at present unsettled. In the chief area, the Witwatersrand itself, the system is divided by Dr. Mellor, who has recently mapped it in detail, into lower and upper groups, and these again into five series.

The *Lower Witwatersrand* beds comprise :—

The *Hospital Hill series*, commencing with the Orange Grove beds, quartzites and shales, which form the conspicuous northern escarpment of the Rand overlooking lower ground towards Pretoria. They rest upon a denuded surface of granite and schists, and are followed by thinly laminated siliceous and ferruginous rocks locally called slates or shales. With these beds are two thin but remarkably persistent bands of quartzites, the

ripple-marked quartzite and the felspathic speckled bed. Towards the top of the series are the thick Hospital Hill quartzites, sometimes coloured green, and in parts having large well-rounded quartz grains set in a finer grained quartzite matrix (sago structure). These quartzites, with the shales interbedded with them, form the ridges immediately north of Johannesburg.

The *Government Reef series* lies conformably on the Hospital Hill series, but along the Central Rand they are for the most part eliminated by strike-faults, a fact which was brought out by Dr. Mellor's mapping, and which was responsible for many misunderstandings of the succession of the rocks below the Main Reef group before the map appeared. The series consists of quartzites and shales, some of which are very ferruginous rocks and thin conglomerate beds which have not been found to be worth mining on a large scale.

The *Jeppestown series*, red-weathering argillaceous rocks with subordinate sandstones or quartzites, rarely forms good outcrops; it varies in apparent thickness from place to place owing to faulting.

The *Upper Witwatersrand group* follows the lower conformably, and differs from it chiefly in being more arenaceous and in having a greater development of conglomerates. At its base is the *Main-Bird series*, some 3,000 feet of quartzites with subordinate argillaceous beds and persistent bands of conglomerate, notably the Main Reef group of conglomerates in the lower part of the series, which are the important beds from an economic point of view because they yield almost all the gold won on the Witwatersrand gold field. In the Central Rand there are three reefs of banket—the local name for a gold-bearing conglomerate of quartz pebbles set in a matrix of pyritic quartzite. These are known as the Main Reef, Main Reef Leader, and South Reef. The Main and South Reefs thin out eastwards, leaving the Main Reef Leader as the productive reef there, and the Leader disappears westwards. The beds of conglomerate are not uniformly auriferous, and it has been found in certain areas that rich patches, several thousand feet in length, extend in a south-easterly direction, and are bordered by poorer conglomerate or even by rock formed by the hanging and foot walls coming together to the exclusion of pebble beds. The origin of the gold in the rock was probably detrital, as in placers, but it has been recrystallized subsequently. Evidence of the great molecular changes which have taken place in the Main-Bird series since their consolidation is seen in the abundance of chloritoid in the sediments, and in many of the older dykes of intrusive rocks which traverse them. Detailed study of the petrography of the conglomerates has been made by Prof. R. B. Young. The conglomerates above the Main Reef group, the Livingstone and Bird Reefs, are thin individually, though numerous, and are non-persistent. A band of chloritoid-chlorite rock, known as the Bird Reef Marker, lies a short distance above the Bird reefs on the Central Rand, and andesitic lava, called the Bird Amygdaloid, is on the same horizon in the East Rand and Heidelberg. The Hercules shaft of the E.R.P.M. passes through the two rocks, the amygdaloid being underlain by the sedimentary type. The *Kimberley-Elsburg series* lies conformably on the beds just described, and at their base is a thick band of argillaceous beds, the Kimberley shales. The Kimberley conglomerates are usually separated from the shales by quartzites, and grits and quartzites some 3,000 feet thick separate the Kimberley from the Elsburg conglomerates. These latter are often large-pebble conglomerates, and in the main area of their occurrence north of the amygdaloids of Klipriversberg no discordance below them has been detected. The occurrence, however, of very similar conglomerates lying unconformably on Lower Witwatersrand beds at Langermann's Kop and the north side of Bezuidenhout Valley points to the unconformable overlap of the Elsburg beds northwards.

Witwatersrand beds form considerable areas in the Heidelberg and Klerksdorp districts, and also in Vredefort. In Heidelberg the thickness of the Witwatersrand system is reduced to 57 per cent. of what it is on the Rand, while the series are reduced to from 30 to 66 per cent.

The *Ventersdorp system* lies on the Elsburg beds conformably in the Klipriversberg and Heidelberg, and overlaps the Witwatersrand beds unconformably on the Witwatersrand; in the Cape Province it lies on older rocks. It is mainly a volcanic group, and three sub-divisions, the *Zoetlief*, *Kuip*, and the *Pniel series*, have been distinguished by Dr. Du Toit, separated from each other by unconformities. The Zoetlief beds are acid lavas, tuffs, quartzites, shales, limestones, conglomerates, and flagstones found in Bechuanaland, Prieska, and in the Kimberley rock-shafts. Acid lavas resembling those of the Zoetlief beds occur at Klerksdorp and other places in the Transvaal. The *Kuip series* has only been recognized near Omdraaisvlei; it consists of basic lavas, arkose, flagstones, limestones, and chert. The Pniel series covers a much wider area than the two lower groups in the Cape Province. The lavas of the Pniel series are usually blue or green amygdaloidal diabase or andesite, though quartz-porphyries also occur, and tuffs and breccias accompany them. Conglomerates, quartzites, and other sedimentary rocks often underlie the volcanic beds in the Cape Province. In the Transvaal the Ventersdorp system covers wide areas south

and west of the Witwatersrand; amygdaloidal diabase, such as that in the Klipriversberg, plays a very important part in the formation, but there are conglomerates and quartzites as well as fragmental volcanic rocks in it. The Ventersdorp beds are not found under the Black Reef in the eastern Transvaal or the Pietersburg district; in the western and southern Transvaal and the neighbouring part of the Cape there is a close connexion between them in their distribution, though there is a marked unconformity separating them.

In the valley of the Orange River, from 12 to 36 miles above Upington, there are several areas of volcanic and sedimentary rocks known as the *Koras* series. They rest unconformably on, or are faulted against, the Kheis beds, but they have suffered little from shearing, and in this respect they offer a great contrast to all the other pre-Karroo rocks of the district. The series consists of two groups; the lower, and mainly volcanic, group is overlain unconformably by the upper group, which is composed of conglomerates and sandstones. The volcanic beds are composed of andesitic and basaltic lavas and tuffs, and there are intercalations of a red quartz-porphyry, probably intrusive, in them. The upper group contains much material derived from both the lavas and the porphyry. The correlation of the *Koras* series is uncertain, but it is probably part of the Ventersdorp system.

The *Transvaal system* is the most widely distributed of the pre-Karroo sedimentary rocks in the Union, and it also forms very large areas in South-West Africa. At its base is the *Black Reef* series, a group of quartzites and conglomerates with intercalations of shales. In Vryburg there are also volcanic rocks interbedded with the Black Reef, which, on account of their close resemblance to the underlying Ventersdorp lavas, emphasize the connexion between the two formations. The Black Reef series forms the great escarpment of the eastern Transvaal, where it is thicker than elsewhere, giving rise to some of the finest scenery in the Province. It received its name from the occurrence of black carbonaceous matter in the conglomerates mined for their gold content in the southern Transvaal. In the west of the Union these beds are very probably represented by the *Nieuwerust series*, which underlies the Malmesbury beds in Namaqualand and Van Rhynsdorp, and by the Kuibis beds in South-West Africa. The Black Reef series is conformably overlain by the Dolomite in the Transvaal, the neighbouring part of the Cape Province (*Campbell Rand series*), and in South-West Africa (*Schwarzkalk* and *Otavi series*). In Little Namaqualand thick dolomitic limestones lie on the Nieuwerust beds; but here there is a change becoming more marked southwards, the beds become an argillaceous and arenaceous group, the Malmesbury beds of the Cape Province. East of the Cape Peninsula, however, in Oudtshoorn and Humansdorp, there are again limestones (Cango and Hankey limestones) which may prove to be part of this series. In the Transvaal, Bechuanaland, and Griqualand West, the Dolomite has a most important influence on the water supply owing to its taking up large volumes in fissures and cavities, and giving the water out again from large springs. It is, in fact, the only formation in the Union which can be said to be water-bearing on a large scale. The rock is compact and usually crystalline, and the water is not held by the rock itself but is in the widened joints and other spaces. In Little Namaqualand there is a thick series of crystalline limestones, the *Kaigas series*, overlying the quartzitic *Stinkfontein series*. These two series are separated from the Nieuwerust and Malmesbury beds of Neint Nababeep by a few miles of older granite, and they are much folded and sheared in contrast to the rocks of Neint Nababeep. There are, however, strong reasons for regarding the Stinkfontein and Kaigas beds as the folded western equivalents of the Neint Nababeep rocks. The Stinkfontein series includes some lavas and breccias, and such rocks are not known in the Nieuwerust beds. The Dolomite is succeeded conformably by the *Pretoria series* (*Griquatown series* of the Cape Province), which consists of quartzites, shales, highly ferruginous beds and volcanic rocks, chiefly andesitic (Ongeluk beds). In the Cape Province and in parts of the Transvaal, asbestos (crocidolite and amosite) is strongly developed in the strata below the volcanic horizon, apparently by the rearrangement of material in the sediments in cross-fibred veins of amphiboles strictly parallel to the bedding. Important deposits of iron ore exist in the Pretoria beds in the Transvaal and Griqualand West. In the Cape Province there is a well-developed tillite with striated boulders just below Ongeluk lavas, and in Namaqualand the very remarkable *Numees series* lying above the Kaigas beds has many of the features of a tillite. The Numees beds are succeeded by green slates and a thick volcanic group, the Groot Derm beds, which are as yet little known. In Van Rhynsdorp and the districts to the south there is an unconformity above the Malmesbury beds, and the younger groups of pre-Cape sediments have thick conglomerates at their base in the Ibiquas and French Hoek beds. Whether the Cango conglomerates include beds overlying the limestones of that area is as yet uncertain, but some thick quartzites and conglomerates of that region apparently underlie the limestones. In the Transvaal, the Pretoria series includes three well-marked groups of quartzites, named from below upwards, The Timeball Hills, Daspoort and Magaliesberg quartzites.

In early editions of this article the *Rooiberg series*, consisting of felspathic quartzites, quartzites, shales, and felsitic lavas, which were invaded by the Bushveld igneous rocks,

and in places clearly form the roof of the Bushveld norite and granite, was grouped in the Waterberg system and called "Lower Waterberg." During 1922 the work of the Shaler Memorial Expedition (under Prof. Daly) and the Geological Survey included re-examination of the supposed intrusive contacts of the Red Granite and Upper Waterberg at Balmoral and Gatkop, the result being to show that the Upper Waterberg beds rest on the granite with a sedimentary contact at those places and to necessitate the restriction of the term "Waterberg System" to what was formerly called "Upper Waterberg." The *Rooiberg series* is now provisionally classed with the Transvaal system, but east-north-east of Pilansberg it rests apparently unconformably on lower beds of that system.

A very important feature in the Transvaal is the mass of intrusive rocks which occupies an area some 280 miles long from east to west, and 160 miles wide in the central part of the country, and which is known as the Bushveld Igneous Complex. The rocks are in part covered by fragments of their original roof and partly also by much younger beds belonging to the Karroo system. The mass, as a whole, behaves as a lopolith, with a floor made of the lower members of the Transvaal formation and a roof of the Rooiberg series. It is composed of various rocks, possibly differentiates of a common magma, soda-rich granite (the Red Granite of Transvaal geologists) in the central parts, and more basic rocks, diabase, norite, gabbro, and pyroxenite in the peripheral and lower portions. Intrusions of the granite in the basic rocks prove that the latter solidified first. The mineral and structural changes produced by the Bushveld Complex on the surrounding rocks are extensive, and have been made the subject of special studies by Dr. Hall. The numerous sheets of diabase intruded amongst the Transvaal beds in the southern and central Transvaal are regarded as belonging to the Bushveld Complex, as are also the long dykes of syenitic rocks in the Transvaal. The scattered intrusions of nepheline-syenites and related rocks, of which the most important group is that of the Pilansberg, where there are also phonolites and other lavas (described by Drs. Brouwer and Humphrey), are generally considered to be the latest products of this great phase of igneous activity. The date, however, of this volcanic episode and the intrusion of the peculiar rocks associated with it is not known, but boulders of the peculiar rocks have been identified in the Karroo beds, and related dykes in Heidelberg are older than that formation. Prof. Shand has lately made careful studies of some of the intrusive rocks. There is nothing quite analogous to the Bushveld Complex in other parts of the Union, but in Namaqualand there is a large intrusion of hornblende-granite rich in lime-soda felspar penetrating the Nama (Transvaal) formation, and there are dykes of bostonite and camptonite associated with it. The date of this intrusion has not been fixed more closely, but the large granite masses of the south-west of the Cape Province (Cape Peninsula and its neighbourhood, Robertson, George, and Van Rhynsdorp) are normal granites and are post-Malmesbury (Transvaal) and pre-Cape in age.

The tin deposits of the Transvaal are connected with the Bushveld granite, and the less important tin ores of the Cape district with the granite there. The basic rocks of the Complex include deposits of chromite, and also platiniferous dunite and nonite, proved by recent prospecting work to have considerable economic importance.

The *Waterberg system* forms large tracts of country in the northern Transvaal (Waterberg and Zoutpansberg districts), and in the Pretoria and Middelburg districts. In the latter it rests unconformably on the Pretoria beds. It consists of conglomerates and quartzitic sandstones; the colour of the sediments is predominantly red or purplish, and the conglomerates are often coarse. The base of the *Waterberg system* in the Zoutpansberg is made of volcanic rocks of basaltic type.

The *Matsap series* of Bechuanaland, Griqualand West, and Prieska is regarded as the correlative of the Waterberg system on account of its stratigraphical position and lithological characters. It lies unconformably on beds belonging to the Ventersdorp and Transvaal systems, and is unconformably covered by the Dwyka. It consists of a great thickness of purplish quartzites with conglomerates and shales; but the arenaceous types predominate. In the middle of the series there is, on the eastern side of the Langebergen, a thick volcanic group, andesitic lavas and tuffs. The Matsap and Waterberg beds have not been connected by mapping between the north end of the Langebergen and the Transvaal, through Bechuanaland, but they may well be parts of one system.

The *Cape system* is developed in the south and west of the Cape Province, and it appears again on the south-east coast near Port St. Johns, and continues through the coast belt of Natal. Only the lowest series is found in the east.

One of the great questions of correlation in South Africa is whether the Waterberg system of the Transvaal is a part of the Cape system; but if, as is generally held, the Waterberg and the Matsap are parts of one system, there are great difficulties in regarding the Cape system as being their southern representative. In the south there is a conformable succession from the Cape beds upwards into the Karroo formation; while in the north a great unconformity, which represents a period of mountain building as well as a very long period of denudation, separates the Matsap and Waterberg formations from the Karroo beds.

The lowest member of the Cape system is the *Table Mountain series*, a group of sandstones and shales, the former predominating, which builds up the mountains of the Cape Peninsula and the long ranges flanking the Karroo on the south and west. In the Cedarberg there is a thick band of mudstone, containing scattered pebbles and boulders of various kinds of rocks, some of which are striated after the fashion of glaciated stones. This tillite lies about a thousand feet below the top of the series. The sandstones are often quartzitic, and have a characteristic appearance. They are occasionally conglomeratic, but the pebbles are usually scattered or form layers only one pebble thick.

The second series in the system is the *Bokkeveld* group, consisting of shales and sandstones, in the lower part of which there is a fairly abundant marine fauna closely related to that of the Lower and Middle Devonian of South and North America, and less closely to the Lower Devonian of Europe. Some of the Cape species have also been found in the Sahara. The Bokkeveld beds form the greater part of the cultivated portions of the Ceres District and the valleys between the Zwarteberg and the south coast, as well as the valleys immediately north of the Zwarteberg.

The third and youngest series is the *Witteberg* group of shales, sandstones, and quartzites, which are well seen along the western line of railway between Touws River and Matjesfontein. These beds have yielded few fossils, only badly preserved plants and a fragment of an eurypterid.

The Cape system is fully developed between Karroo Poort and the region where it is cut off diagonally by the coast near Port Elizabeth. North of Karroo Poort it becomes thinner and thinner owing to denudation in pre-Karroo times, and north-west of Calvinia the Karroo beds rest directly on the older Nama rocks or on granite.

The Karroo system occupies the whole of the central part of the Cape Province, almost the whole of the Orange Free State, the western side of Natal, and a large area in the south-eastern Transvaal. No evidence has yet been found that marine conditions occurred in this large area of deposition during Karroo times, but in a part of South-West Africa two kinds of marine fossils have been found in the lower beds of the system. In the southern Karroo the Witteberg series passes up conformably into shales, which are taken to be the base of the Karroo system, and which in their turn pass up into a hard boulder-clay or tillite without any precise line of division. To the north of Karroo Poort the shales are wanting and there is an unconformity below the tillite. The tillite is now regarded as of glacial origin by almost all geologists, for on no other hypothesis have the peculiarities of the rock been explained. It has a matrix of mudstone or slightly laminated and sandy, often calcareous, hardened clay, containing pebbles and boulders of many varieties of rocks occurring in places to the north of the spots where they are found in the tillite, and many of them are flattened and striated after the fashion of the stones in glacial deposits of regions which are now, or have within recent times been, covered by sheets of ice. In many districts north of the Karroo the tillite rests upon striated surfaces, or characteristically shaped hummocks of rock called *roches moutonnées*, which is very strong evidence of the glacial origin of the formation. The thickness of the tillite varies from a foot or so, or it may even be absent altogether, as in parts of the Transvaal, up to 1,400 feet in the southern Karroo. The general direction of movement of the ice was from the north. The tillite is followed conformably by shales in the west, south, and east, but in the Transvaal there is almost certainly a break of unknown but not great extent at the top of the *Dwyka series*, as the lowest group of Karroo rocks is called.

The *Ecca series* follows the Dwyka conformably in the Cape Province and Natal. It consists of shales and sandstones, and in Natal and the Transvaal the Middle Ecca beds are the main source of coal in the Union, and they also contain oil-shales. In the south of the Cape Province the Ecca beds reach their greatest thickness—over 6,000 feet. The series decreases in thickness northwards, and in the Transvaal it is probably only a few hundred feet thick. The Ecca beds contain a flora characterized by the genera *Glossopteris* and *Gangamopteris*, which, with their fellows, are found also in the Gondwana beds of India, and in Australia and South America. In these four regions of the globe the *Glossopteris* flora occurs in beds overlying tillite like the Dwyka tillite, and it is this fact which leads to the belief that an Arctic climate prevailed over a great region in the southern hemisphere at the remote period when the coal-measures of the northern hemisphere were being formed, or soon afterwards. The evidence as to the age of the beds as compared with the European rocks is obtained from Australia and India, for the marine fauna on which it rests does not occur in South Africa.

The *Beaufort series* lies conformably on the Ecca in the Karroo region, Natal, and the southern part of the Orange Free State, and it has been definitely recognized in the south-eastern Transvaal. Its most striking feature is the abundance and variety of its reptilian fossils, which are of exceptional interest because they include forms with mammalian relationships and the habit of walking with the body raised clear of the ground as proved by the structure of their legs. With the reptiles are amphibians, fish, lamellibranchs of fresh-water habit and some plants belonging to the same genera as those in the Ecca below,

as well as, in the uppermost beds, a few which are found in the Molteno beds above. Sandstones, shales, and mudstones, with a small amount of limestone, chiefly in the form of nodules, make up the Beaufort beds. In the south-eastern Transvaal Dr. du Toit has found that the upper coal beds of Volksrust are in the Beaufort series.

The *Stormberg series* follows the uppermost Beaufort beds conformably in the east of the Cape Province, and the neighbouring part of Natal and Basutoland, and it is ushered in by the shales and sandstones known as the Molteno beds, which are coal-bearing and include some oil-shales.

The Molteno beds contain a flora with Triassic affinities, but none of the reptiles known from the Beaufort series has been found in them. The Molteno beds occur in the east of the Orange Free State, but they have not been found in the north of that Province nor in the Transvaal.

The Molteno beds are succeeded in the Cape, Natal, Basutoland, and the south-east of the Orange Free State by the Red beds, which are red weathering sandstones and shales containing a few dinosaurs and other reptiles and fish.

The Cave sandstone, a rather remarkable formation of thick bedded sandstone, succeeds the Red beds conformably in the Cape, Natal, Basutoland, and the Orange Free State, and it also occurs in the Transvaal, where it is known as the Bushveld sandstone. It contains a few dinosaurs, a crocodile, fish, and some small crustacea. The Cave sandstone makes bold outcrops along the slopes of the Drakensberg in East Griqualand, Natal, and Basutoland; it is very closely associated with the volcanic rocks of the *Drakensberg series* at the top of the Karroo system, which form the precipitous portion of the Drakensberg or Quathlamba range, the Maluti Mountains, and also much of the flat country (Springbok Flats) of the Transvaal Bushveld. The lowest volcanic beds are interbedded with the Cave sandstone, and the series consists of andesitic and basaltic lavas and tuffs. A large number of the vents or necks from which outbursts took place are known, but it is probable that much of the lava came from long fissures now represented by dykes of dolerite. In the Lebombo the basaltic lavas are succeeded by rhyolites. The volcanic rocks of Zuurberg are of pre-Uitenhage age and are underlain by sandy marls containing fragments of bone; they are basalts, tuffs, and breccias, and are probably of Stormberg age.

To the latest part of the Karroo period belong the *intrusions of dolerite*, which are found traversing nearly all the rocks in the Union older than the *Drakensberg series*, as well as that group. The only large tract in the Cape Province which is free from dykes and sheets of this dolerite is the Folded Belt. The dolerite sheets give rise to the long lines of cliffs capping the escarpment of the Nieuwveld and its continuations to east and west, and both sheets and dykes form conspicuous features in the Orange Free State, Natal, and the Cape Province. In Griqualand East picrites and other ultra-basic differentiates of the basaltic magma have been discovered, and in the Insizwa, Tonti, and Ingeli masses they form important bodies of rock which may yield metallic ores of value. The acid differentiates are much more widely distributed. They are small bodies of diorite and granophyre, which rarely give rise to any conspicuous feature.

The *Cretaceous system* in the Union comprises beds of marine and continental origin found on or near the south and east coasts. The chief areas of these beds are in the Uitenhage and Alexandria Districts (where Dr. W. G. Atherstone first made out their sequence), Oudtshoorn, Riversdale, and Mossel Bay, where the older beds, called the *Uitenhage series*, occur. Narrow strips along the coast of Pondoland, and a wider area on the northern coast of Natal, are made of younger Cretaceous beds.

The lowest beds of the Uitenhage series are conglomerates and sandstones, which are followed by plant-bearing shales. In the Sunday's River valley these are succeeded by shales and limestones containing marine fossils of Neocomian age. West of the Uitenhage Division marine fossils have only been found in a small outlier of the series near Knysna. All these areas of Uitenhage beds are faulted down against older rocks to the north.

On the Pondoland coast conglomerates and sandstones have been faulted down against older rocks near the Embotyi River, and the few fossils found in them are like some of those in the larger area of marine shallow-water beds of the *Umzamba series* farther north-east. Many fossils have been collected from these beds, and show that they are of Campanian or Senonian age. At the Umzamba the beds lie unconformably on the Table Mountain series. In Natal the Senonian beds are underlain by Cenomanian strata on the Umfolosi.

Near East London and in Alexandria there are some marine limestones of Danian age, but little is known of them yet.

In Bushmanland a remarkable deposit of granite wash containing bones of dinosaurs fills an old valley leading to the Orange River. This may be a remnant of the continental deposits formed when South Africa began to have the type of climate which has led to the formation of the Kalahari, the semi-arid region from which Bushmanland is separated by the valley of the Orange River.

At some time after the Uitenhage beds were laid down, perhaps at a much later date, the peculiar phase of volcanic activity began, which is represented by the contents of many pipes and fissures distributed through the central portion of the Union, and found also in the Drakensberg, Riversdale, Van Rhynsdorp, Namaqualand, Gordonia, and outside the borders of the Union in Rhodesia and South-West Africa. Natal seems to be without them. The age of each occurrence can, of course, only be determined by the surrounding rocks, but there are certain features common to them and connecting links between diverse types of material filling the channels, so that it is probable that they were all related in origin. There can be no doubt that some explosive force produced the channels, or took advantage of pre-existing paths of weakness, and that the channels were filled with fragmentary or molten rock derived from various depths between the lower parts of the earth's crust and the superficial strata. As Dr. Wagner suggests, the explosions seem to have been connected with the marked rise in level of the sub-continent in late geological times. The most striking instance of a large pipe filled with fragments of the rocks traversed, but apparently devoid of minerals derived from contemporaneous rock-magma, is Geitsi Gubib in South-West Africa; but similar pipes and fissures exist in Van Rhynsdorp and Ceres. In the Sutherland Division there are many vents clustered round Saltpetre Kop filled with material derived from the rocks passed through mixed with minerals belonging to volcanic rocks, and in the neighbouring country there are pipes filled with breccia resembling blue-ground in containing minerals derived from great depths, accompanied by masses of melilite-basalt. The pipes and fissures filled with the rocks commonly known as blue-ground have been more thoroughly explored than any other of these channels, because some of them contain diamond in sufficient amount to repay mining, as at Kimberley, also near Pretoria, and at several places in the Orange Free State. Dr. Wagner has shown that these ultra-basic rocks, kimberlites, comprise basaltic and micaceous varieties, both of which may contain diamond, and that this mineral was almost certainly a component of the magma from which they were derived by differentiation at great depths. Xenoliths of eclogite in kimberlites and kimberlite tuffs and breccias have been found with diamond in them, and they have been regarded as the source of the diamond and accidentally associated with kimberlite; but the evidence is now very strongly in favour of these being cognate xenoliths formed at depth in the magma which also gave rise to kimberlite. The opinion of Carvill Lewis, that kimberlite may have been a melilite-basalt has not been substantiated, but the occurrence of that rock in several pipes in Sutherland, at Spiegel River, and in Namaqualand, where it also contains nepheline, points to some connexion between them.

In the Limpopo valley ultrabasic lavas, limburgites, and soda-rich rocks are in contact with various horizons of the Karroo formation. These lavas cover hundreds of square miles, and they were apparently poured out over an uneven surface of Karroo and earlier rocks. They may be of Cretaceous or Tertiary age; or, again, they may be little later than the Stormberg volcanic rocks, but they do not, like those, lie conformably or with moderate unconformity upon the Cave sandstone.

Beds of *Tertiary* age are known in the Union, but little information concerning them is at present available. The best known are those belonging to the *Alexandria* formation of Prof. Schwarz, and there are inshore marine beds occurring at various heights up to some 1,300 feet above sea-level on the south and east coasts. The fossils, according to Mr. R. B. Newton, are of Mio-Pliocene age. None of the early Miocene species described by Böhm and Weisfermel from near Bogenfels north of the Orange River have been found in the Union, though the fossil cephalopod, *Aturia*, a genus which occurs at Bogenfels, has been dredged off the Cape Province. Mr. Wm. Anderson discovered late Tertiary or early Pleistocene deposits on the coast of Zululand, containing the remains of extinct kinds of hippopotamus, buffalo, buck, and elephant. Inland deposits of Tertiary age are indicated by the occurrence of mastodont remains in the high-level gravels of the Vaal River near Barkly West. Extinct species of buck and buffalo from the Modder River, and a horse from the south-west coast, are probably Pleistocene.

In the Knysna district some valleys in the Table Mountain series are filled in with sands and lignites loosely consolidated. The age of these beds has not been ascertained, but they are perhaps as old as the Tertiary. Gravels far above the level of the modern rivers, and the superficial deposits cemented by lime or silica, which are widely spread within the Union, perhaps date back to Tertiary times, but proof of age is lacking. The calcareous tufas are extensively developed in the Kalahari region, the Transvaal, and Griqualand West, and less widely in the Karroo and the coast belt. The recent discovery of the bones of an extinct anthropoid ape in the tufa of the Kaap Rand, near Taung, points to these deposits being of great antiquity. The siliceous deposits which are closely connected with those cemented by hydrated iron oxides in the Folded Belt of the Cape, are most conspicuous in the country below the great escarpment, though they have not been noticed in the central part of the Great Karroo. They also occur in the Kalahari, Bechuanaland, and Griqualand West.

The gravels which are the site of the diamond-diggings in the Transvaal, Griqualand West, and Aliwal North lie at various levels from that of the modern river-beds, to 400 feet above them, and many miles from their banks. The chief diggings are in the Vaal and Hart's River gravels. In a few instances diamond gravels have been found far from the rivers, on the top of the Kaap Plateau. The deposition of these gravels probably dates back to Tertiary or even late Cretaceous times.

The great deposits of sand in the Kalahari and Bushmanland are of great age, though they are being formed to-day. The evidence from Bushmanland that dinosaurs lived there at the time when the valleys cut in the granite began to be filled with wash from the neighbourhood, and that since then the climate has allowed the steady levelling up and down of the inequalities of the surface, affords an indication that the development of the features characteristic of that region began in pre-Tertiary time.

C.—GEOLOGICAL STRUCTURE.

The dominating feature in the structure of South Africa is the great syncline of Karroo beds stretching 820 miles from Karroo Poort in the Ceres Division north-eastwards to Carolina in the Transvaal, with a width of 340 miles between Kimberley and the Transkei coast. On the north-western side of this irregularly oval area the base of the Karroo rocks maintains an altitude of between 2,500 and 5,500 feet above the sea, and the beds dip at very low angles towards the basin. On the south, between the Tanqua Karroo and the Keiskama, they are folded in a general east-west direction, and their dip carries them deep under the Karroo region. The shore cuts the edge of the syncline from the Gualana to the St. Johns River, and where the base of the system emerges near the latter, it is no longer markedly folded, but, striking through Natal, is affected by faults. The belt of pre-Karroo rocks trending north-north-east through Natal is on the axis of a low, broad anticline much faulted in its eastern limb, which in Swaziland merges in the easterly dipping beds of the Lebombo. Outliers of Karroo beds north of the syncline prove that they once stretched far beyond the borders of the Union, and that over the northern region there has been no earth-movement of the mountain-building kind since the commencement of Karroo times. The arc-shaped ranges of Griqualand West and Bechuanaland, the Langebergen and Kuruman hills, were undergoing denudation then, and the same statement holds good for much of the Transvaal, where the east-north-easterly trend of the structural lines in the Low Veld of the north, and the east-west syncline of the Witwatersrand are of pre-Transvaal date. The broad anticline trending east-north-east from the south-west of the Province to the West Rand is of pre-Karroo and post-Transvaal age, but it is superimposed upon older and more pronounced disturbances along approximately the same lines; and the marked arrangement of the hills about the great Bushveld intrusion, of which the longer axis is directed a little north of east, is a feature of pre-Karroo times. In the Transvaal the trend-lines of pre-Karroo age are chiefly in an east-north-east direction, and this strike, due to forces acting perpendicularly to that direction, was repeated at long intervals. In the north and west of the Cape Province the pre-Karroo movements were nearly at right angles to this, and produced north or north-north-west trends, and they were followed by the late or post-Karroo movements of the Cedarberg region. In the south the east-west trend of the pre-Cape folds was repeated in the late or post-Karroo movements, which gave rise to the southern mountain ranges. South and west of the Karroo the ranges with northerly trend in the west, and easterly trend in the south, are made of the Cape formation, and are due to the folding of the crust in late Karroo times by forces which tended to over-fold and thrust the strata towards the Karroo region, and the folds were produced where the Cape and lower Karroo sediments were very thick. The axes of the southern folds are inclined eastwards, so that the folded belt is traversed slantingwise by the coast between Cape St. Francis and the Keiskama.

The whole form of the basin, as it is now seen, has been determined by earth movements which gave rise to the dip of the beds, and by denudation removing the folded or nearly flat beds from part of the area formerly covered by them. The thickest deposits of the Karroo system were probably much nearer the southern limit than the northern, but whether the southern limit is within 100 miles of the original limit of deposition is unknown. The outliers in Worcester, Robertson, and Uitenhage prove that the rocks once extended south of the mountain ranges, and there is no trace of an unconformity at the base of the Karroo beds till they reappear on the coast of Pondoland.

The outliers of Cretaceous beds within the folded belt, probably remnants of a formerly continuous cover of those beds stretching westwards from Algoa Bay at least as far as Worcester, are faulted down on the south side of fractures parallel to the trend of the pre-existent southern folds. The great Worcester fault, the first of these important features to be discovered by Prof. Schwarz, was for long thought to be of pre-Cretaceous date, but Dr. Rastall has shown that it, like the eastern faults of the same group, was of post-Uitenhage age.

The main lines of the structure of Namaqualand were determined in pre-Karroo times, when the Nama formation had been subjected to intense folding on the west along axes trending north; but post-Karroo faulting is proved by the outliers of Dwyka in the valley of the Orange River, not far above sea-level. The flat country of the Kalahari and Bushmanland, now divided by the Orange River, is essentially a pre-Karroo plain, diversified by a few isolated hills, and is being stripped of its cover of Karroo beds except in the large areas where the accumulating sand protects the underlying rocks from denudation

The great escarpment which plays such an important part in the geography of the Union commences as a definite feature in the slope of the Woodbush, and from there southwards to the Carolina district the base of the Transvaal system forms the uppermost and steepest part; in that district the Karroo beds come in, and higher and higher beds of the system take part in the face of the escarpment as it is followed southwards into Natal, where the Quathlamba is a rampart of volcanic beds at the top of the Karroo formation; in the Native Territory of the Cape Province the same conditions hold, but the volcanic beds disappear in the Stormberg, and westwards of that region the escarpment is capped by lower and lower beds, until in Van Rhynsdorp the Nama system and still older rocks alone take part in its structure. There is thus a broadly symmetrical character in the escarpment on the two sides of the continent, and the asymmetrical feature due to the presence of the volcanic beds in the east has some relation to the submergence of the south-eastern edge of the Karroo basin in the same quarter. Since the escarpment lies, broadly speaking, parallel to the coast, it is natural to look for a connecting link between the two features. The greatest departure from this correspondence is in the south, where the Cape ranges intervene and the coast-line projects in conformity with the curve of the ranges in the Ceres district (syntaxis of the Zwartberg and Cedarberg folds), and does not follow closely the blunter sweep of the escarpment. In trying to find an explanation of the existence of the escarpment, it is most important to bear in mind the very great age of the interior of South Africa as a land-surface; from the Cape ranges northwards to Central Africa the country has probably been exposed to the air since Triassic times, and for a further period stretching back to Devonian times the sea is not known to have encroached upon it. How far the Devonian sea advanced north of the latitude of Calvinia is unknown. It appears from the present state of our knowledge that the escarpment marks the limit of headward erosion of the rivers draining the coast-belt and the Great Karroo, and that the prominence of the feature for long distances is due to the agents of erosion having encountered resistent horizontal or gently inclined strata or intrusive sheets of dolerite, one or other of which is a prominent feature of the greater part of the margin of the interior plateau. In Namaqualand these flat strata have in part been removed by denudation, but large remnants exist in the Steinkopf plateau, and again in the fragments near Nieuwerust. This view entails the great age of the coast-line as a whole, though it is often held that the straight or smooth shape of the coast indicates a recent origin through faulting. The fact, however, that inshore deposits of various dates from early Cretaceous to late Tertiary and recent age are preserved, on the south and east coast chiefly, is in harmony with the supposed great age of the coast as a whole, and no great faults parallel to the coast have yet been found. The great faults with downthrow on the ocean side, those flanking the southern ranges, are cut by the coast slantingwise. The enlargement of the area outside the escarpment in the Cape Province is evidently connected with the folding which took place in the region of the very thick deposits of the Cape and Karroo periods, and that in the north-east part of the Union is connected with the extensive rise in level of the sub-continent in Cretaceous and post-Cretaceous times.

D.—SYSTEMS OF GEOLOGICAL FORMATION.

		Stratified Formations.	Maximum Thickness.	Igneous Intrusions.	Earth Movements.
Cainozoic		Recent and sub-recent sands, gravels, tufas, ironstones, and surface quartzites; raised beaches.	Over 300 ft.		Depression of coast region, giving rise to lagoons.
		Marine inshore beds of Alexandria, Addo, Bredasdorp, and Zululand; lignites of Knysna	Small		Uplift of whole of South Africa.
		Ultrabasic lavas of Limpopo valley (?)			
Mesozoic	Cretaceous System.	Need's Camp series (Danian).....	—	Volcanic pipes and fissures of Kimberlite and melilite - nepheline basalts	Uplifts.
		Umzamba series (Senonian); Pondoland, Umkwelane Hill; shelly limestones and conglomerates	50 ft.		Encroachments of sea on south-east coast.
		False Bay (Zululand) and Manuan Creek (Cenomanian), clayey limestones	50 ft.		Faults in region of southern ranges.
		Uitenhage series (Neocomian): Sunday's River beds; marine clays and limestones	Over 4,000 ft.		Encroachments of sea over part of area where southern ranges exist.
		Uitenhage series (Neocomian): Wood beds; sands and clays			
		Uitenhage series (Neocomian): Enon beds; sands, clays, and conglomerates			
	Karroo System.	Drakensberg or volcanic beds; basaltic and andesitic lavas and tuffs of Quathlamba, Springbok Flats and Lebombo rhyolites	4,000 ft.	Intrusion of basic rocks throughout the Union	Emergence of land over Karroo region, following the restriction of area of deposition during the rise of the southern ranges.
		Stormberg series (Triassic and higher): Cave sandstones of Quathlamba and Bushveld sandstones of Transvaal	800 ft.		
		Stormberg series (Triassic and higher): Red beds; sandstones and shales	1,600 ft.		
		Stormberg series (Triassic and higher): Molteno beds; sandstones, shales, and conglomerates with thin coals in Cape Province	2,000 ft.		
		Beaufort series (Permian and Trias): Burghersdorp beds; shales and sandstones	3,000 ft.		Mountain building in the south and west of Cape Province.
		Beaufort series (Permian and Trias): Middle Beaufort beds; sandstones and shales	1,000 ft.		
		Beaufort series (Permian and Trias): Lower Beaufort beds; shales and sandstones	7,000 ft.		
		Ecca series; shales and sandstones; coal in Transvaal and Natal	6,200 ft.		
Palaeozoic		Dwyka series...: Upper shales....	800 ft.		Long period of depression and deposition in the south of the Union.
		Dwyka series...: Tillite.....	1,400 ft.		
		Dwyka series...: Lower shales....	1,000 ft.		
	Cape System.	Witteberg shales and quartzites series	2,500 ft.		
		Bokkeveld series; shales and sandstones; marine (Devonian) fossils in lower half	2,500 ft.		
		Table Mountain series; quartzitic sandstones and shales; tillite in Cedarberg region	5,000 ft.		Mountain building in Griqualand West, etc.
		Alkaline volcanic rocks of Pilansberg..	—	Syenitic dykes and sills	

D.—SYSTEMS OF GEOLOGICAL FORMATION—*continued.*

	Stratified Formations.		Maximum Thickness.	Igneous Intrusions.	Earth Movements.
Waterberg System.	Waterberg; sandstones, shales and conglomerates	Matsap series of Griqualand West etc.; quartzites, conglomerates, lavas, and tuffs	5,000 ft. Over 7,000 ft.		
	In East.	*In West.*			
Transvaal System.	Rooiberg series; quartzites, shales, and lavas	—	2,000 ft.	Intrusion of Bushveld Complex	Mountain building in south and west of Cape Province. Long period of depression in the north, west, and south of the Union.
	Pretoria series; shales, lavas, quartzites, and a tillite, ferruginous beds	Ibiquas, Numees, and Groot Derm beds	10,000 ft.	Intrusion of younger granites of the Cape Province	
	Campbell Rand series; dolomites, shales	Malmesbury and Kaigas beds	3,500 ft.		
	Black Reef series; quartzites, shales and conglomerates	Nieuwerust and Stinkfontein beds	2,550 ft.		
Ventersdorp System.	Pniel series; lavas, tuffs, conglomerates, shales, and quartzites	Koras series of Kenhardt and Gordonia; lavas, sandstones, conglomerates	5,000 ft.		Minor uplifts in Griqualand West, Bechuanaland, and Transvaal.
	Kuip series; lavas, limestones, cherts, sandstones, arkose				
	Zoetlief series; acid lavas, shales, quartzites, conglomerates				
Witwatersrand System.	Upper Witwatersrand beds: Kimberley-Elsburg series; quartzites, grits, conglomerates and shales		24,000 ft.	Intrusion of basic dykes in S. Transvaal	Uplift over Witwatersrand.
	Upper Witwatersrand beds: Main-Bird series; quartzites, grits, conglomerates, shales, and lavas				
	Lower Witwatersrand beds: Jeppestown series, chiefly shales				
	Lower Witwatersrand beds: Government Reef series; quartzites, shales, ferruginous beds, grits, and thin conglomerates				
	Lower Witwatersrand beds: Hospital Hill series; quartzites, shales, ferruginous beds, arkose				
Swaziland System (Inter-correlation unknown).	Pongola* series: Upper Pongola beds; shales, quartzites, and conglomerates			Intrusion of Palabora Complex	Mountain building in north and west, followed by prolonged denudation.
	Pongola* series: Lower Pongola beds; quartzites, phyllites, lavas				
	Abel's Kop beds	Schists, limestones, banded ironstones		Intrusion of gneisses, etc., of north and west of the Cape Province and the Transvaal and Natal	
	Kheis series: Wilgenhout Drift beds; sedimentary and volcanic rocks				
	Kheis series: Kaaien beds; quartzites and schists				
	Kheis series: Marydale beds; sedimentary and volcanic beds				
	Kraaipan series; schists, ferruginous cherts, and volcanic rocks

E.—EARTHQUAKES AND EARTH TREMORS IN THE UNION.*

There are certain portions of the earth which are subject to the occurrence of great earthquakes. Such regions of seismic instability are Japan, the west coast of North and South America, and Italy. The sub-continent of South Africa is, however, considered to be particularly free from any great seismic instability. There is no recent record of any world-shaking earthquake having originated in South Africa. But within the borders of the Union there are quite a number of regions where earthquakes of a very light character originate. Such regions are the Waterberg district of the Transvaal, the northern portion of Zululand and the Piet Retief district, the southern portion of the Orange Free State, the Cape Peninsula, and the vicinity of Kokstad in Griqualand East. In these areas light shocks are not infrequently felt, but in the majority of cases they are only just discernible locally as a rumble or a vibration lasting only for a few seconds, and have not done any material damage.

On the 20th February, 1912, an earthquake occurred which was felt almost all over the Union. The centre of this shock was found to be in 25° 6′ east longtitude, 29° 45′ south latitude, i.e. near Koffiefontein in the Orange Free State. In the neighbourhood of this town many farm buildings were completely destroyed, and as far away from the centre of the shock as Kimberley, cracks were formed in the walls of buildings. Many other shocks of less intense nature have also been felt in this region.

On the 5th August, 1909, there was a rather severe shock in the northern Zoutpansberg, which was felt as far away as Bulawayo on the one side and Johannesburg on the other. No actual damage was done by this shock, although considerable alarm was created at the Seta Diamond Mine, which was near the centre of the disturbance. The most recent South African earthquake occurred on the 25th November, 1924, at 4.31 a.m. The centre of this disturbance was near Warmbaths in the northern Transvaal. Again this earthquake was not severe enough to cause any material damage.

In February, 1908, considerable interest was aroused in seismological questions by the occurrence on the Witwatersrand of a series of local earth tremors. In order to obtain additional information as to the origin of these shocks, i.e. whether they were truly tectonic or whether they were to be attributed to the extensive gold-mining and water-pumping operations taking place on the Witwatersrand, seismographs of the Wiechert type were installed at the Union Observatory in 1910. The evidence of the seismograph records was to the effect that these shocks were essentially local in character and were not to be classified as true tectonic earth movements. From 1908 these local tremors increased steadily in frequency until 1917. From that year the annual frequency of the shocks has not changed very greatly: on the average about 236 tremors, of sufficient intensity to be noticeable by residents on the Witwatersrand, are now felt each year. Several Commissions have been held with the object of investigating the causes of these tremors, and it is now generally held that they are the almost inevitable results of mining operations on an extensive scale. Such tremors are not peculiar to the Witwatersrand gold mines, but are also experienced in other mining areas, e.g. the Indian goldfields.

In spite of the frequent occurrence of earth tremors on the Witwatersrand, very little damage, apart from accidents actually in the mines, can be directly attributed to them. There have been a few cases of buildings being cracked or chimneys thrown down, but these have been near mining property, where slow subsidence of the ground has probably contributed to the weakening of buildings. The greater part of Johannesburg is not undermined at all, and here no damage has been done. Since it has been recognized that mining operations are the ultimate cause of the tremors, certain modifications in the methods of mining have been introduced with a view to reducing the tendency for tremors to occur and minimizing their effect. Thus it is confidently anticipated that the local tremors will not increase in violence and that their occurrence need not be any cause for alarm.

F.—A SURVEY OF THE MEDICINAL SPRINGS OF SOUTH AFRICA:†

Their Economic and Scientific Interest.

1. **General.**—The majority of the older countries regard their medicinal springs as real assets, worthy of scientific investigation and commercial exploitation. In many of these countries medical guides to the principal spas are issued, books of reference containing such information as may interest the physician, the chemist, and even the prospective visitor. Recently an International Society of Medical Hydrology has been established, the main object of which is to encourage in all countries the clinical and experimental study of the action of natural waters on the body, both internally and externally.

In South Africa little public or scientific interest is taken in the subject, although there are in this country some seventy springs known or reputed to be endowed with medicinal virtues. Many valuable data concerning them are in existence, but no effort has been made

* Contributed by H. E. Wood, M.Sc., Chief Assistant at the Union Observatory, Johannesburg.
† Contributed by M. M. Rindl, D.Sc. (Eng.), Professor of Chemistry, Grey University College, Bloemfontein.

to collect and correlate them. Some of the information is recorded, but much of it has never found its way into print. The writer of this article made an attempt some years ago to put together all the available facts, incomplete and fragmentary as they are, in a perspicuous form, with the double object of placing on record such work as has been done and of stimulating interest by showing what still remains to be done.*

Mineral springs are characterized by a high temperature, or by the presence in them of some particular constituent not usually found in ordinary water, or of large quantities of dissolved mineral matter. The term mineral spring is often regarded as synonymous with medicinal spring. But there are many mineralized springs which are not endowed with therapeutic properties, and many medicinal waters of high repute are, chemically speaking, nearly pure water. Of the numerous sulphur springs and salt (brak) waters of our country, very few can claim recognition as medicinal springs. The efficacy of a spring cannot be deduced from, or expressed entirely in terms of, its percentage chemical composition. Co-operation of the medical man and the chemist is essential.

The usual saline constituents of mineral waters are the chlorides, bromides, iodides, sulphates, carbonates, bicarbonates, and sulphides of sodium, potassium, lithium, calcium, magnesium, and iron. Others are occasionally found in traces, but their inclusion in the above list seems superfluous, as they are not credited with any medicinal properties. The gases usually found are carbon dioxide, sulphuretted hydrogen, oxygen, nitrogen, and radium emanation, the importance of which is universally recognized, although its precise effect is still shrouded in mystery.

The mineral constituents of springs are dissolved out of the rocks over which the springs flow or through which they percolate. Often a series of complex chemical reactions takes place. If highly oxygenated waters come into contact with pyrites enclosed in limestone, both ferrous sulphate and sulphuric acid are formed. This sulphuric acid acts on the limestone, with the result that the water becomes charged with carbonic acid gas. Carbon dioxide may also be derived from subterranean accumulations of volcanic origin or from the decomposition of organic matter. If this oxidation process takes place in the case of pyrites enclosed in dolomitic rocks, the conditions for the formation of purging waters are given. If the sulphuric acid, the formation of which has just been referred to, acts on alkaline silicates, glauber salt is formed. Highly carbonated water percolating through limestone contains calcium bicarbonate in solution and so forth. Many springs at their point of discharge give rise to co-called sinter deposits. Some of the carbon dioxide of the bicarbonates of calcium and iron diffuses into the atmosphere, leaving deposits of insoluble calcium and iron carbonates. This iron carbonate is often further oxidized to ferric hydrate, which is found encrusting the " eyes " of all chalybeate springs.

The high temperature of many mineral springs is ascribed by some to the internal heat of the earth, by others to the thermal effect of the chemical reactions referred to above, by others again to the generation of heat in consequence of the shearing movements of the earth's crust. Controversies are still raging about the extent to which each of these factors is called into play.

Mineral springs seem to abound in volcanic districts and in strata that have been considerably bent and crumpled. But that their occurrence is not limited to such formations will appear from the geographical positions of our South African springs.

Within the scope of an article of this kind there is no room for a discussion of the therapeutic properties of mineralized waters, particularly as the subject is here treated from the chemical point of view. Moreover, this aspect of the problem can only be done justice to by a medical man who has made a special study of hydrology. Whilst the writer of this article can lay no claim to any knowledge of medical hydrology, he feels justified in calling attention to a point which is not sufficiently appreciated by proprietors of medicinal springs in this country. It is generally recognized elsewhere that systematic dieting, proper exercise, and cheerful surroundings are an essential part of the cure at a watering-place, and that competent medical advice and guidance are necessary with regard to the method of taking the waters, etc. Whatever the potential virtues of the South African springs, the majority of them can never hope to claim serious recognition as spas as long as they are carried on under the same primitive conditions as at present. Very few of them have even adequate accommodation for patients, and if visitors are compelled to camp out in tents and wagons, the beneficial effect of the waters is likley to be nullified by the conditions of living.

Whilst chemical investigation undoubtedly represents the first step in the examination of a water, prolonged physiological observation is required to establish the conditions in which the use of a particular water is indicated. Chemical knowledge of the South African springs is most fragmentary and woefully inadequate, and the knowledge of their therapeutic properties is even more so. Unfortunately, even the little information which is available is often not considered when a watering-place is selected, with the result that patients are often sent to springs which are not suited to their particular ailments.

---

2. **Classification.**—The following basis has been adopted in the classification of South African mineral springs :—

Group I. Indifferent Waters.—These contain only very small quantities of solid substances in solution. Some of them, as a matter of fact, contain less saline constituents than many ordinary drinking waters. But they all have a higher temperature than the average temperature of the atmosphere, and many of them contain dissolved nitrogen, the presence of which seems to be connected with their medicinal value. Their use is indicated particularly in rheumatism, gouty affections, and inflammations. Many of them are radio-active. Typical European examples of this class are Buxton in England, Pfaefers and Ragaz in Switzerland, Teplitz in Bohemia, and Gastein in Austria.

Group II. Earthy Waters.—These are characterized by the presence of large quantities of the carbonates and sulphates of lime and magnesia. Their use seems to be indicated mainly in cases of urinary trouble. Wildungen in Germany, Bath in England, and Bormio in northern Italy belong to this class. Hitherto no springs of this class have been found in South Africa.

Group III. Alkaline Waters.—The principal constituents are carbonate and bicarbonate of soda with free carbon dioxide, and sometimes also sulphate and chloride of sodium. They are sub-divided as follows : (*a*) Carbonated waters with small quantities of solid constituents, but not less than 400 c.c. of carbon dioxide per litre. Some of the well-known continental table waters, like Apollinaris and Giesshuebler Sauerbrunn, belong to this class. Their action seems to be simply a mild stimulating effect on the digestion. (*b*) Simple alkaline waters with more carbonate and plenty of free gas, but very little of other constituents. Examples : Vichy in France and Fachingen in Germany. (*c*) Muriated alkaline waters, containing sodium chloride in addition to sodium carbonate and bicarbonate. Examples are : Mont Dore in France and Ems and Selters in Germany. The muriated alkaline waters are frequently used in cases of bronchial catarrh. (*d*) Alkaline springs with sulphate of soda : Franzensbad, Marienbad, and Karlsbad in Bohemia. The use of alkaline waters is indicated in digestive complaints of all kinds. They are frequented by people suffering from obesity with its concomitant troubles.

Group IV. Iron or Chalybeate Springs.—These usually contain iron in the form of bicarbonate, rarely as sulphate. Their use is recommended in cases of anaemia, chlorosis, nervous troubles, and venereal diseases. Tunbridge Wells in England and Spa in Belguim are typical examples.

Group V. Salt Springs.—These contain mainly sodium chloride and small quantities of the chlorides of calcium and magnesium, and are used in cases of scrofula, rachitis, chronic skin affections, rheumatism, gout, heart and nerve troubles. Besides being used as baths and taken internally, the waters are sometimes atomized, i.e. the air is impregnated with finely divided particles of water and salt. Homburg, Kissingen, Baden-Baden, and Reichenhall, all in Germany, are well-known representatives of this type. The group is sub-divided into weak and strong salt waters, and into brine springs containing bromine and iodine.

Group VI. Sulphur Springs.—These contain sulphides (mainly of sodium) and sulphuretted hydrogen. They are used for gout and rheumatism, cutaneous and hepatic affections. Examples are Aix-la-Chapelle in Germany, Aix-les-Bains (Savoy) and Cauterets in the Pyrenees.

Before passing on to the discussion of the individual South African springs, the writer desires to make it clear that in this general system of classification no attempt has been made to give a complete list of all the sub-groups, and that the list of disorders and diseases enumerated under each group is by no means exhaustive.

3. **Description of Individual South African Springs.**—*Group I. Indifferent Waters.*—Of the springs belonging to this class, that at Brandvlei, near Worcester, already attracted the attention of early travellers. Gumprecht, in " Die Mineralquellen auf dem Festlande von Afrika " (1851), gives an enthusiastic and detailed account of its curative powers. Burchell, in his book " Travels in the Interior of Southern Africa " (1811), calls attention to the uncommonly high temperature of the water, 145° F. (63° C.), and states that the course of the stream flowing out of the pond surrounding the springs can be traced for over a mile by the cloud of steam hovering over it. The spring seems to have fallen into discredit in recent times, and the primitive bath-house that once stood there has been allowed to fall into ruins. Although indifferent waters are usually characterized by a high temperature, this spring is interesting as having a higher temperature than all the European waters of this class with the sole exception of Plombiéres-les-Bains, Departement Voges, France.

The only spring of this group which has attained to more than a local reputation is the one at Montagu, Cape Province. This spring appears to have been known to, and frequented by, the Hottentots and Bushmen before the advent of the white man, but little was done to make it attractive until it was acquired by the New Cape Central Railway in 1907. The

company erected a bath-house, a swimming-bath, and a well-appointed hotel. Radio-active peat baths were also installed. The water, which issues at a temperature of 112·3° F. (44·5° C.), is stated to be strongly radio-active. A considerable quantity of gas bubbles up with the spring, consisting of a mixture of oxygen and nitrogen with a little carbon dioxide. Dr. C. H. Muller, who has had twenty-one years of experience at the Montagu Baths, states that he has found the waters most beneficial in cases of rheumatism (subacute, chronic, and gonorrhoeal), rheumatoid arthritis and gout, skin diseases (chronic eczemas and psoriasis), neuritis and sciatica, arteriosclerosis. Cases of malta fever are also greatly benefited.

The other springs belonging to this group which are reputed to be endowed with therapeutic properties are Goudini, near Worcester, Olifants River, 45 miles south of Clanwilliam, the Warm-Waterberg spring near Barrydale, and the spring at Tarka Bridge, district Cradock. They are only visited by people living in the immediate neighbourhood, or are not exploited at all.

Group III. Alkaline Waters.—The most noteworthy springs in this class are probably those at Windhoek in South-West Africa. At Gross-Windhoek there are three springs of temperature 70–73·5° C. which enjoyed considerable reputation for their medicinal virtues even before the advent of the white man. At Klein-Windhoek, which is separated from Gross-Windhoek by a low range of hills, there are also several medicinal springs of lower temperature (45–55° C.), but similar to those of Gross-Windhoek with respect to their chemical constituents, and also endowed with therapeutic properties. The high temperatures show the Windhoek springs to be of deep-seated origin. They rise from micaceous schist. The balance of evidence is in favour of the assumption that springs of this type are "Juvenile Waters," formed by the liberation of water vapour or even hydrogen under high pressure from the magma. Medical men who have experience of the therapeutic action of the Windhoek springs recommend their use for digestive and metabolic disorders, respiratory catarrhs, and diseases of women.

The spring at Warmbaths, northern Transvaal, has a temperature of 140° F. (60° C.) and is described as mildly alkaline. The bathing establishment, which is the property of the Transvaal Provincial Government, contains a swimming-bath and a paddling-pool for children, and provision is made for vapour and mud baths. The water is purgative, and is reputed to be efficacious in gout, rheumatism, and sciatica. This spa has been gaining in popularity during recent years, the daily average of patients recorded during the summer months being well over a thousand.

There are, in addition, a number of alkaline waters in Rhodesia, and the spring at Badplaats, or Doornpoort, district Carolina, Transvaal, appears to be a sulphated alkaline water. At all of these the conditions of living and the provision for bathing are most primitive.

Group IV. Iron or Chalybeate Waters.—The best known of the South African chalybeate spas is Caledon. The history of the Caledon baths dates back to the early days of the Dutch occupation, but there is reason to believe that the aborigines were acquainted with its healing properties even before that time. One of the first authentic accounts of the waters is found in a book by Francois Valentijn on the Dutch East India Company's possessions. This was printed in Amsterdam in 1724, and in it he mentions the efficacy of the hot mineral springs of Caledon. Vaillant, in his book "Reize in de Binnenlanden van Africa, langs de Kap de Goed Hoop in den jaren 1750–55," mentions the high esteem in which these baths were held in those far-off days. The Dutch East India Company was fully aware of their value, and many officials invalided from the East derived new strength and health from their healing waters. Subsequent to the taking over of the country by Great Britain many English East India officers visited the baths. The opening of the Suez Canal, however, turned away the tide from the East, and the springs, falling into incompetent hands, were for a long time almost forgotten. In more recent times, however, an up-to-date sanatorium has been built, where manipulation and swimming and electric baths are provided. The water is radio-active and hyperthermal (49° C.). In point of temperature the water was almost unique until the Zwartkops borehole was sunk, the water of which is fully five degrees hotter. As a matter of fact, there are very few European chalybeate springs of higher temperature. Dr. G. W. B. Daniell, who was for many years resident at Caledon, states, in a paper read before the Second Medical Congress of South Africa in 1893, that the waters have been proved by experience to be invaluable in the following morbid conditions: (1) Anaemia, malarial cachexia, chlorosis, convalescence from acute diseases of any kind; (2) scrofula; (3) rheumatism; (4) gout and rheumatic gout; (5) neuralgia, sciatica, chorea, hysteria: (6) Bright's disease; (7) diseases of women; (8) chronic diarrhoea; (9) skin diseases; (10) certain diseases of the respiratory tract; (11) liver diseases; (12) surgical diseases. Subsequent experience has shown that this summary needs little or no modification.

The Zwartkops spring is a quite exceptional hyperthermal water, reported to be highly radio-active. It issues from a borehole in the Uitenhage beds at a depth of 3,600 feet, and

was struck when drilling for petroleum in 1909. Its temperature is 54·5° C. The composition of the gas issuing with the water shows carbon dioxide, oxygen, and nitrogen, with small amounts of hydrogen, helium, and neon. There is a small establishment for treatment, and gastro-hepatic and renal disorders are among the cases that are reported to derive benefit.

Whilst the waters of Caledon and Zwartkops contain the iron as bicarbonate the spring at Balmoral, near Port Elizabeth, is unusual as containing the iron in the form of sulphate. Hence its bitter and astringent taste. Other springs belonging to this class are at Tooverwater Poort, near Willowmore, at Warmbad in the Olifants River bed, about 30 miles southwest of Oudtshoorn, and at Inungi in the bed of the Umzimvubu River, west of Kokstad. One of the Inungi springs is remarkable on account of its exceptionally high iron-content, which is about four times as high as that of the famous Caledon water. As this spring also has constituents which make it partake of the nature of both earthy and alkaline waters, it certainly deserves attention.

A noteworthy feature of South African chalybeate springs is that most of them are warm. Iron springs in other parts of the world are, as a rule, cold.

Group V. Salt Springs.—In view of the large number of salt pans in the Union, particularly in the so-called " Panne-veld," i.e. the area including the districts extending from Calvinia and Fraserburg up through Gordonia, Griqualand West, and the western Orange Free State, the paucity of salt springs which are used medicinally is most extraordinary. The three salt springs known, or reputed, to be endowed with medicinal virtues are all so mildly saline that it is still an open question whether the amount of sodium chloride which they contain justifies their classification as salt springs. The best known of this group, the one at Rietfontein near the Haagenstad salt pan, about equidistant from Bloemfontein and Brandfort, lies on the eastern fringe of the area named. The other two springs of this class are on the farm De Villiersgunst, near Winburg, Orange Free State, and at Warmbad in South-West Africa.

Group VI. Sulphur Springs.—A characteristic feature of South African sulphur springs is that they are, as a rule, thermal, whilst the majority of sulphur springs elsewhere are cold or only tepid. One of the sources of the Zongala geyser in Northern Rhodesia nearly touches boiling point. The Aliwal North springs, which are sub-thermal, with a temperature of 95° F. (35° C.), issue into a small lake which is utilized as an open-air swimming-bath. In addition, there is a bath-house containing a swimming-bath at which provision is made for ordinary and electric baths. A radio-active gas, containing 94·6 per cent. of nitrogen, argon, and helium, issues from the eyes of the springs. This spa offers an instructive example of how little guidance chemical analyses are in estimating the therapeutic value of a water. These springs, which are the poorest in sulphuretted hydrogen in the country, have been proved by experience to be the most efficacious as sulphur springs.

At Malmesbury, the bath-house is the property of the municipality, and contains a swimming-bath and a number of rooms with porcelain-tiled baths. It is served by faintly sulphuretted and chlorided sub-thermal water at 91° F. (33° C.).

The springs at Lilani in Natal have an average temperature of 38° C., and the water is reported to be radio-active and to contain sulphite and thiosulphate ions in addition to a little sulphuretted hydrogen. It is claimed to be efficacious in cases of rheumatism, gout, sciatica, cutaneous diseases, malaria, and obesity. A sanatorium has been erected, and provision is made for open-air bathing as well as for sand and mud baths.

Machadodorp in the Transvaal has a group of highly radio-active springs of an average temperature of 28° C. Chemically these springs are interesting as being the only ones among the better known sulphur waters in the country which contain alkaline sulphides in addition to sulphuretted hydrogen. Seven eyes are enclosed by a cement structure and roofed over to provide a kind of basin from which bathing cells are fed. The erection of a proper establishment is contemplated.

Of the fifty-six medicinal springs about which sufficient information is available to enable them to be classified, fully one-half belong to this group. A few of them are patronized by the farmers living in the immediate neighbourhood. Several are held in high esteem by the natives. Where there are any bathing facilities at all these are of a most primitive nature. Therapeutically, practically nothing is known about the majority of them, and chemically they offer little of interest so far as the available information goes. But geologically a number of the Rhodesian springs of this group can claim more than ordinary interest on account of their high temperature. The maximum temperature of the Zongala geyser is 97° C., that of the Goa geyser 63° C., whilst the water of the Kapessa hot spring is practically boiling. They all lie in a limited area between 16° and 18° south latitude and 27° and 29° east longitude. In the same area in the Sebungwe district, there is also a spring which is practically boiling, and which issues out of a hole in an isolated rock, according to the description of the natives " with a noise like a small steam engine working." From the fragmentary data available this spring, however, appears to be a salt spring.

4. **Natural Table Waters.**—In the classification as adopted elsewhere there is no independent group of table waters. The majority of the well-known European table waters come from places which have a reputation as health resorts, and consequently these table waters are classified under the different groups of medicinal springs. Moreover, table waters differ in composition to such an extent as to belong to different groups. The majority of them, however, belong to the various sub-groups of alkaline waters. As the springs supplying the South African table waters are not frequented as health resorts it has been deemed desirable for the sake of simplicity to group all of them under a separate class. The best known of these, the Van Riebeek spring, issues from the Tygerberg, between Bellville and Durbanville. The bottling department of the Van Riebeek Natural Mineral Water Co., Ltd., is at Bellville Station, and the water is conducted thither from its source by 31,000 feet of tin piping. The source of the spring from which the Vasco waters are obtained is also on the Tygerberg. The Driebaden spring is near Jagersfontein, whilst the Seltzbach water comes from a spring at Van der Merwe, a siding on the Delagoa line, twenty-one miles from Pretoria.

5. **Conclusion.**—The original publications on which this article is based are the outcome of a search, undertaken as a result of the acute shortage of potash during the war, for springs sufficiently rich in potash to be of economic value. Whilst the investigation failed to establish the existence of potash deposits in South Africa, the writer was struck by the number and properties of the springs described as being endowed with medicinal virtues. The endeavour to correlate the data and to classify the springs showed how incomplete the available information was, and how little interest was taken in a valuable asset. But a few interesting facts emerge from a comparison of the springs, not the least interesting of which is the high temperature of many of them and their geographical distribution. The majority of the known medicinal springs in South-West Africa lie in a zone running through the middle of the country from north to south practically through its entire length. In addition to the medicinal springs there are several not used therapeutically but of high temperature in this zone: Gross-Barmen 64–65° C., Windhoek 70–73·5° C., Rehoboth 53° C., Klein-Barmen (Otji Katiti) 61–63° C., Omapiu 61° C., Omburu given variously as 61° and 77° C., Warmbad 38° C. A prolongation of the line strikes a number of the springs in the Cape Province, namely, Clanwilliam 42–43 °C., Goudini 40° C., Brandvlei 62° C., and Caledon 49° C. The majority of the remaining hot springs in the Province lie on a line running from Caledon more or less parallel to the coast as far as Port Elizabeth, namely Montagu 45° C., Barrydale (no temperature recorded, but said to be uncomfortably hot), Warmbad (Olifants River) 45·6° C., Tooverwater Poort 49° C., and Zwartkops 54·5° C. It might be interesting to ascertain whether this regularity of grouping is not something more than mere accident. There are several problems of a similar nature in connexion with the South African medical springs which are of sufficient scientific interest to merit investigation, and which might well lead to results of economic value.

§ 8. Area of the Union.

1. **Area.**—The total area of the Union is 472,347 sq. miles. The area of each Province is given hereunder. The area of each magisterial district in the Union will be found in the District Summary.

AREA OF PROVINCES.

Cape of Good Hope.	Natal.	Transvaal.	Orange Free State.	Union.
Sq. Miles.	Sq. Miles.	Sq. Miles.	Sq. Miles.	Sq. Miles.
276,966	35,284	110,450	49,647	472,347

The above figures reflect corrections which were made necessary owing to re-computation of the Orange Free State area by the Surveyor-General of that Province in 1924, based on new topographical maps embodying more recent surveys. The detailed adjustments are shown in the District Statistical Summary, and the revised figures are used in Chapter XXIV and other parts of this *Year Book* (in the computation of densities, etc.).

2. **Comparison with other Countries.**—Particulars are given hereunder as to the total area of the Union in comparison with the area of each self-governing British Dominion, and the area of certain other countries in Europe, America, Asia, and Africa :—

AREA OF UNION AND VARIOUS COUNTRIES.

Area of Union..... 472,347 square miles.
South-West Africa..... 322,450 square miles.

Country.	Sq. Miles.	Country.	Sq. Miles.

§ 9. The Plant Geography of South Africa.

A special article on the Plant Geography of South Africa was published in previous ssues (Nos. 1 to 4) of this *Year Book* and in a revised form in the fifth and sixth issues. The author was Dr. I. B. Pole Evans, C.M.G., M.A. (Cantab.), D. Sc., F.L.S., Chief of the Division of Botany and Plant Pathology in the Department of Agriculture and Director of the Botanical Survey of South Africa. Owing to exigencies of space it has been found impossible to repeat this article in the present issue of the *Year Book*.

§ 10. Economic Plants of South Africa.*

1. **General.**—The work undertaken by the Division of Botany in the investigation of plants of possible economic value is more than of mere scientific interest, as to-day increasing attention is being paid to the exploitation of plants as sources of raw material utilized in various branches of manufactures. Man is not only dependent on plants, either directly or indirectly, as food ; in every phase of human activity parts of plants, or some plant produce, enter into use.

The investigation of the properties of our native plants may, therefore, lead not only to the discovery of products which are in use to-day, but may also possibly bring to light

* By E. P. Phillips, M.A., D.Sc., F.L.S., Senior Botanist, Division of Botany, Union Department of Agriculture.

products which may suggest new channels for industry. This work is being steadily conducted by the Division of Botany, and much important data has been collected, which is at the disposal of farmers or commercial men interested in the growing or utilization of particular plant products. The list given below details some of the more important plants investigated by the Division. No mention is made, however, of native timbers, as that subject is more suitably dealt with by the Forest Department, nor of the poisonous plants, which are being dealt with elsewhere. The list is arranged alphabetically in families, with the species under each family. This was done for the sake of convenience in description and without reference to the grouping into plant products.

In general, the products derived from plants may be grouped under the following heads (after Willis) :—

(i) GUMS, RESINS, CAOUTCHOUCS, GUTTAPERCHAS, ETC.—These products arise from the drying or coagulation of saps or other excretions or are obtained from them by distillation or otherwise (*Landolphia Kirkii*, var. *delagoensis* ; *Combretum erythrophyllum* ; *Euryops multifidus* ; *Othonna arbuscula* ; *Acacia Karroo*).

(ii) OILS.—(*a*) Fixed oils (*Sclerocarya caffra* ; *Ricinodendron Rautanenii* ; *Bauhinia esculenta* ; *Trichilia emetica* ; *Myrica cordifolia* ; *Ximenia caffra* ; *Calodendron capense* ; *Pappea capensis*) ; (*b*) volatile oils (*Mentha longifolia* ; *Barosma betulina*).

(iii) DYES AND TANNING-STUFFS.—*Euclea natalensis* ; *Jatropha Zeyheri* ; *Acacia Benthami* ; *Elephantorrhiza Burchellii* ; *Rubia cordifolia* ; *Osyris abyssinica*.

(iv) FIBRES.—*Asclepias fruticosa* ; *Flagellaria indica*, var. *guineesis* ; *Bobartia spathacea* ; *Abutilon tortuosum* ; *Hibiscus cannabinus* ; *Sida rhombifolia* ; *Hyphaene crinita*.

(v) DRUGS.—*Mesembrianthemum crystallinum* ; *Catha edulis* ; *Artemisia afra* ; *Athrixia phylicoides* ; *Brachylaena elliptica* ; *Leyssera gnaphalioides* ; *Othonna arbuscula* ; *Aspalathus cedarbergensis* ; *Cyclopia brachypodia* ; *C. genistoides* ; *C. tenuifolia* ; *Aloe ferox* ; *Barosma betulina*.

(vi) EDIBLE PRODUCTS (including well-known stock plants).—*Mesembrianthemum crystallinum* ; *M. floribundum* ; *Galenia africana* ; *Tetragonia arbuscula* ; *Sclerocarya caffra* ; *Carissa grandiflora* ; *Salsola aphylla* ; *Salsola Zeyheri* ; *Atriplex halimus* ; *Pentzia incana* ; *Acanthosicyos horrida* ; *Cucumis metuliferus* ; *Doryalis caffra* ; species of grasses : *Acacia Giraffae* ; *Sesbania cinerascens* ; *Portulacaria afra* ; *Vangueria infausta* ; *Chrysophyllum magaliesmontanum* ; *Minusops obovata*.

(vii) MISCELLANEOUS.—*Helichrysum vestitum* (flower heads) ; *Abrus precatorius*, *Afzelia quanzensis*, *Erythrina Zeyheri* (ornamental seeds).

2. **Classification of Economic Plants.**—(*a*) AIOZACEAE.—A large family of plants containing about 500 species. Represented in South Africa by the genera *Mesembrianthemum* (vygies) and allied genera, mostly all succulent plants, *Aizoon*, *Tetragonia*, etc.

(i) *Mesembrianthemum crystallinum* L. (Brakslaai).—A prostrate succulent herb, covered with white glittering papillae. When young, the plant is a good stock-food. The plant is also of interest medicinally and has been investigated by the Wellcome Bureau of Scientific Research.

(ii) *Mesembrianthemum floribundum*, Haw.—A prostrate succulent herb with small cylindric leaves. Found abundantly in carroid areas where the soil is not perceptibly "brak" (alkaline). Affords excellent pasture for small stock.

(iii) *Galenia africana*, Linn. (Kraalbos).—A small shrub with opposite linear leaves. Eaten by stock in times of drought.

(iv) *Tetragonia arbuscula*, Fenzl.—A much branched small shrub. A good stock-food.

(*b*) ANACARDIACEAE.—A large family of plants with over 500 species found in all tropical countries. Well represented in South Africa by the genus *Rhus*. The "cashew-nut" (*Anacardium occidentale*) is a well-known member of the family.

(v) *Rhus* spp.—Shrubs or small trees, several species of which form food for stock in times of drought.

(vi) *Sclerocarya caffra*, Sond. (Marula or Maroola).—A large tree found in the Bushveld and the Low Country. It bears a succulent fruit about the size of a small plum with a pleasant acid taste. The fruits make an excellent jelly, and are also used by the native in preparing a fermented drink. The seeds contain oil.

(*c*) APOCYNACEAE.—A large tropical family of trees and shrubs containing over 1,000 species. Several species are well-known poisonous plants and some species of *Landolphia* yield rubber.

(vii) *Carissa grandiflora*, A.D.C. (U'Amatungula, Natal Plum).—A tall shrub, 10 to 20 feet high, with forked spines bearing a large scarlet fruit, used for making jams and jellies and also used as a dessert. Frequently grown as a hedge plant.

(viii) *Landolphia Kirkii*, Dyer, var. *delagoensis*, Dewevre.—A woody climber found in Zululand and said to yield an excellent rubber.

(*d*) ASCLEPIADACEAE.—A tropical and subtropical family with over 1,800 species. Represented in South Africa by the genus *Asclepias* and *Stapelia* (carrion-flowers), besides many other genera. Some species are known to be poisonous to stock.

(ix) *Asclepias fruticosa*, Linn. (Melkbos).—A small bush up to 4 feet high, containing a milky juice in the branches. The stems contain an excellent fibre, but no satisfactory method has been found for extracting the fibre. The large inflated fruits contain seeds covered with long silky hairs, suitable as a stuffing for cushions, etc.

(*e*) CELASTRACEAE.—A family of trees and shrubs with over 400 species, found mostly in the tropics. Well represented in South Africa by the genus *Gymnosporia*. A few species are of minor importance as timber in the native forests.

(x) *Catha edulis*, Forsk. (Bossiemans Tee).—An unarmed shrub with opposite leaves, also found in tropical Africa. The leaves which contain the alkaloid catine are used in the same way as the ordinary tea.

(*f*) CHENOPODIACEAE.—A cosmopolitan family with over 500 species. The family is fairly well represented in Australia, where many of the species form valuable stock-food plants. Many of the species recorded from South Africa have been introduced.

(xi) *Salsola aphylla*, Linn. (Brak ganna).—A small shrub with minute, closely packed leaves. Found in the arid areas of South Africa and forms a very important stock-food plant.

(xii) *Salsola Zeyheri*, Schinz. (Koolganna or Blomkool-ganna).—Similar to the above with more or less the same distribution. A very valuable stock-food plant.

(xiii) *Atriplex halimus*, Linn. (Brak-bos, Vaalbrak, Soutbos).—One of the indigenous "salt-bushes" is found over considerable areas on ground impregnated with soda. Like the two preceding plants this is an important stock-food.

(*g*) COMBRETACEAE.—Species over 450 found in Africa, South America, the Philippine Islands, and Australia. In South Africa it is represented chiefly by the genus *Combretum*. Several species yield good timber for local use.

(xiv) *Combretum erythrophyllum*, Burch. (Bush Willow).—A tall shrub or small tree bearing four-winged fruits, usually found growing on the banks of streams. A gum is exuded from the stem and is used as a substitute for gum tragacanth.

(*h*) COMPOSITAE.—A cosmopolitan family of over 13,000 species of very various habit. The dominant family of plants in South Africa. Some species, such as *Matricaria nigellaefolia*, *Senecio latifolia*, *Senecio Burchellii*, are known to be poisonous.

(xv) *Artemisia afra*, Jacq. (Wilde-als; Wormwood).—A greyish subherbaceous shrub. Plentiful in some parts of the Union. Employed locally in the same manner as the European *A. absinthium*.

(xvi) *Athrixia phylicoides*, D.C. (Kaffir Tea).—A much branched shrub with slender branches and lanceolate leaves, white on the under surfaces. An infusion of the dried leaves is used locally as a tea.

(xvii) *Brachylaena elliptica*, Less. (Bitterblaar).—An arborescent shrub found mostly in the eastern districts. The leaves are used medicinally in cases of diabetes.

(xviii) *Eriocephalus spinescens* (Kapok Bossie or Snowbush).—A much branched spinescent dwarf scrubby bush found in the Karroo. Is considered a good stock-food plant.

(xix) *Euryops multifidus*, D.C. (Harpuisbos).—A shrubby bush about a foot high, found in the north-western districts of the Cape Province. The branches exude a resin.

(xx) *Helichrysum vestitum*, Less. (Sewejaartjies; Everlastings).—A subherbaceous plant, 1 to 2 feet high, densely woolly. Found in the south-western area of the Cape Province. The flower heads are exported for ornamental purposes.

(xxi) *Leyssera gnaphalioides*, Linn. (Geelblommetjies Tee).—A small shrub about 1 foot high, with needle-like leaves. Common in the south-western area of the Cape Province. An infusion is made from the dried leaves and used as a tea.

(xxii) *Othonna arbuscula*, Sch. Bip. (Nu-nu).—A tall shrub found in Namaqualand. The stems exude a resin which may prove to be of some medicinal value.

(xxiii) *Pentzia incana*, O. Kuntze (Skaapbos).—A small bush of the Karroo with linear leaves. One of the most important of the native stock-food plants.

(*j*) CUCURBITACEAE.—Usually prostrate or climbing herbs furnished with tendrils. A tropical family of over 700 species. Represented in South Africa by many kinds of wild melons. Several species, such as watermelon, pumpkin, and cucumber, are cultivated. One species, *Melothria punctata*, is known to be poisonous to stock.

(xxiv) *Acanthosicyos horrida*, Welw. (Naras).—A spiny bush confined to the sand-dunes in the almost rainless region round Walvis Bay, South-West Africa. The fruits when in season form practically the sole article of diet of the natives.

(xxv) *Cucumis metuliferus*, E. Mey (Wild Cucumber).—One of the native cucumber-like plants of the Kalahari. The fruits when ripe are bright red and covered with conical protuberances. It is cultivated and the fruits used as a salad.

(*k*) EBENACEAE.—A family of trees or shrubs with about 350 species, found in all the warmer parts of the world. Many species of *Diospyros* yield the valuable wood ebony, while *D. virginiana*, L. is the cultivated persimmon. Represented in South Africa by the genera *Euclea* and *Royena*.

(xxvi) *Euclea natalensis*, A.D.C.—A shrub, 2 to 10 feet high, or small tree, found in Natal and parts of the Transvaal. The root-bark produces a dye, which is stated to make a good floor stain.

(*l*) EUPHORBIACEAE.—A large family with about 4,000 species, found in the tropics of both hemispheres. Many of the species are characterized by the presence of a milky juice in the stems. The family is well represented in South Africa by the genus *Euphorbia*.

(xxvii) *Euphorbia coerulescens*, Haw. (Soet Noorsdoring).—A succulent spiny leafless bush, 2 to 3 feet, perhaps more, in height. Found in the Karroo. This is a valuable fodder plant. Other species of *Euphorbia* are also good stock-food plants, e.g. *E. esculenta*, Marl.; *E. brachiata*, E. Mey.; *E. arrecta*, N. E. Br.; *E. hamata*, Sweet; *E. loricata*, Lam.

(xxviii) *Jatropha Zeyheri*, Sond.—A plant with a large underground root-stock from which annual stems arise. It is common in parts of the Transvaal and Orange Free State. The root-stock contains 22·4 per cent. of tannin and yields a pale-brown firm leather of good texture.

(xxix) *Ricinodendron Rautanenii*, Schinz.—A large tree, with digitately 5–7-foliate leaves, native of South-West Africa and parts of Rhodesia. The kernels of the seed yield about 57 to 59 per cent. of a bright-yellow oil of a semi-drying character.

(*m*) FLACOURTIACEAE.—A family most abundantly represented in the tropics. Species about 500; best known in South Africa by the genus *Scolopia*.

(xxx) *Doryalis caffra*, Harv. (Kei-appel, Dingaan's Appel).—A small spiny tree found native in the eastern districts. The fruits are a yellow berry, about an inch in diameter, and are used for jam-making. The plant is frequently grown as a hedge.

(*n*) FLAGELLARIACEAE.—A very small family composed of eight species, confined to the warm regions of the old world. They are robust herbs, sometimes climbing by means of tendrils at the tips of the leaves.

(xxxi) *Flagellaria indica*, Linn., var. *guineesis*, Engl. (Kanot Grass).—A tall climber with cane-like stems, commonly found in the coast belt of Natal. The stems are used for making strong baskets.

(*o*) GRAMINACEAE.—The family comprises all the true grasses, and representatives of the family are found in all parts of the world. A very important family economically, as directly and indirectly it supplies a large proportion of the food supply of mankind. Species of *Hyparrhenia*, *Andropogon*, etc., yield a suitable pulp for paper-making. One species, *Cymbopogon vallidus*, from Pondoland, is being investigated as a source of alcohol. The grasses also form the most important food for stock in South Africa.

(*p*) IRIDACEAE.—Mostly herbs with underground stems called corms. A very large family in South Africa, being represented by such well-known genera as *Watsonia*, *Gladiolus*, *Ixia*, *Moraea*, etc.

(xxxii) *Bobartia spathacea*, Ker. (Biesroei).—A plant with tough rush-like leaves and yellow flowers. Common in parts of the south-western areas of the Cape Province. It is largely used for making fruit baskets.

(*q*) LABIATAE.—A family of the warm and temperate regions, represented by about 3,400 species. In South Africa such well-known genera as *Salvia*, *Stachys*, *Plectranthus*, etc., belong to this family. Most species contain a volatile oil, and peppermint oil, lavender oil, rosemary oil, etc., are distilled from them. Many condiments, such as sage, thyme, etc., are obtained from members of the family.

(xxxiii) *Lasiocorys capensis*, Benth.—A subherbaceous plant with a deep tap-root common in many districts. The stems are browsed down by stock in times of drought.

(xxxiv) *Mentha longifolia*, Huds. (Wild Mint).—A strongly scented herb found in moist places. The leaves yield an essential oil which may possibly be used as a substitute for spearmint oil.

(*r*) LEGUMINOSAE.—A very large family, with about 11,000 species, found all over the world. In South Africa it is represented by such well-known genera as *Acacia*, *Indigofera*, *Aspalathus*, *Tephrosia*, *Rhynchosia*, etc. The family, as a whole, is an important economic one. The seeds of many form important foodstuffs for man, and many produce valuable forage crops for stock; timber, dyes, gums, oils are produced by other species.

(xxxv) *Abrus precatorius*, Linn. (Love-beans, Lucky-beans, Minnie-minnies).—A climbing plant found in the eastern coast-belt, the northern Transvaal, and Rhodesia. The seeds are red and black and are used for ornamental trinkets. They are poisonous.

(xxxvi) *Acacia Benthami*, Roch. (Ruikpeul).—A small thorny tree with bipinnate leaves. The pods are constricted between the seeds and contain tannin. They also produce a dye.

(xxxvii) *Acacia Giraffae*, Burch. (Kameeldoring; Camel's Thorn).—A large thorny tree with bipinnate leaves. The large somewhat woody pods when ground to a meal form a very nutritious feed for stock.

(xxxviii) *Acacia Karroo*, Hayne (Doringboom, Karrooboom).—A common thorn tree of the Karroo and south-eastern districts. The stems exude a gum which somewhat resembles gum-arabic. The leaves and pods also provide a good stock-food.

(xxxix) *Afzelia quanzensis*, Welw. (Mahogany Beans).—A large tree found in Rhodesia, the northern Transvaal, Swaziland, and Portuguese East Africa. The pods are large and woody and contain a black seed partially covered with a red aril. The seeds are used for ornamental trinkets.

(xl) *Aspalathus cedarbergensis*, Bolus (Rooibos Tee).—A small shrub with needle-like leaves found on the mountains of the south-western parts of the Cape Province. The leaves are dried and brewed as a tea.

(xli) *Bauhinia esculenta*, Burch. (Gemsbok Beans).—A plant with a large underground root, from which long branches spring. It is found in parts of the western Transvaal, the Kalahari, and South-West Africa. The seeds contain about 50 per cent. of oil of a non-drying type and similar in composition to cottonseed oil. The seeds form part of the staple diet of the natives.

(xlii) *Cyclopia brachypoda*, Hofmeyr.—Very common in the Caledon and Swellendam districts, and is the source of the commercial "Caspa Tea."

(xliii) *Cyclopia genistoides*, Vent. (Honey Tea).—Found in many parts of the south-western Cape Province. The leaves are used as a tea substitute.

(xliv) *Cyclopia tenuifolia*, Lehm. (Vlei Tee).—A small shrub found on the mountains of the south-western portion of the Cape Province. The leaves are subjected to a process of fermentation and used as a tea. May be bought under the trade name of "Grandiflora Tea."

(xlv) *Elephantorrhiza Burchellii*, Benth. (Elandsboontjies).—An acaulescent plant with bipinnate leaves and very large underground root-stocks. Extremely common on the High Veld during the spring months. The underground portions yield a dye and also contain tannin.

(xlvi) *Erythrina Zeyheri*, Harv. (Dwarf Kaffir Boom).—An acaulescent plant with large underground root-stock and trifoliate spiny leaves. Common on the High Veld. The pods contain red seeds, which are used for making small ornamental trinkets.

(xlvii) *Sesbania cinerascens*, Welw.—A tall plant with pinnate leaves found growing near streams in many parts of the northern Transvaal and Swaziland. The pods contain small seeds, rich in food material, and suitable as a meal for stock feed.

(*s*) LILIACEAE.—Plants usually with a bulbous root-stock, often stemless, sometimes climbing. A large family of over 2,000 species widely distributed. An important family in South Africa, being represented by the genera *Aloe*, *Ornithogalum*, *Asparagus*, *Scilla*, etc. Several species, such as *Urginea Burkei* (Transvaal Slangkop), are extremely poisonous to stock; other species are of some medicinal value.

(xlviii) *Aloe ferox*, Mill. (Cape Aloe).—A very common *Aloe* in some parts of the Union. It has a tall stem, often up to 6 feet high, crowned with a dense rosette of leaves. The thick juice is collected from the leaves and evaporated when the product known as "aloes" crystallizes out. The leaves of some other species of *Aloe* (*A. arborescens*, Mill., *A. speciosa*, Bkr.) yield dyes.

(*t*) MALVACEAE.—Herbs, shrubs, or trees, often covered with star-shaped hairs and with solitary flowers. A very widely distributed family of about 800 species. The fruits of some (*Hibiscus esculentus*) are edible, many produce fibre, the best known of which is cotton from *Gossypium*.

(xlix) *Abutilon tortuosum*, Guill. and Pers.—A plant found naturalized in parts of the Transkei. The bark yields a fibre of good quality.

(l) *Hibiscus cannabinus*, Linn. (Deccan Hemp).—A tall growing plant with straight stems and prickly fruits. Cultivated in parts of the Transvaal for the fibre, which is suitable for the manufacture of bags.

(li) *Sida rhombifolia*, Linn. (Pretoria Bossie, Taaiman).—A very common weed in parts of South Africa. The plant has a long thin tap root and pale-yellow flowers. The stems contain a fibre of good quality, but of short length.

(*u*) MELIACEAE.—A family comprising almost 800 species, frequent in America and Asia. Usually trees or shrubs with the leaves often crowded at the ends of the branches. The valuable timber mahogany is produced by a species of *Swietenia*. Sneezewood is obtained from a native species (*Ptaeroxylon utile*).

(liii) *Trichilia emetica*, Vahl. (Mauferra Seeds).—A tall tree found in Natal, Zululand, northern Transvaal, and Portuguese East Africa. The seeds are black with a red aril, and contain a large quantity of oil from which a solid fat is obtained.

(*v*) MYRICACEAE.—A small family of trees or shrubs, comprising about 50 species, all belonging to the genus *Myrica*.

(liii) *Myrica cordifolia* (Wax-berry).—A spreading bush found growing on sand-dunes from Cape Town to Port Elizabeth. The small spherical fruits have a waxy covering, which is collected by boiling the fruits and skimming off the wax. The wax is used as a floor and furniture polish.

(*w*) OLACACEAE.—A small family of 13 genera and about 100 species, natives of America, Africa, Asia, and Australia. Trees or shrubs with simple leaves.

(liv) *Ximenia caffra*, Sond. (Suurpruim, Sour Plum).—A small bush found in the northern Transvaal. The fruits are edible and the kernels yield about 65 per cent. of a viscous oil of the non-drying type.

(*x*) PALMAE.—This family includes the plants known as palms. It contains about 1,200 species widely spread through the tropics and subtropics of both hemispheres. The family is a very important economic one, as it furnishes edible fruits, seeds, besides other foodstuffs, e.g. sago. The stems of some are tapped for a sugary fluid from which fermented drinks are prepared. Other species yield timber, fibre, etc.

(lv) *Hyphaene crinita*, Gaertn. (Itala Palm).—Very common in the coastal belt of Natal and Zululand and in parts of the northern Transvaal. The young leaves yield an excellent fibre from which string, ropes, mats, etc., are made. The leaves are woven into baskets, hats, and other similar articles, while the kernel of the fruit produces the so-called vegetable ivory. The natives prepare an intoxicating drink from the sap.

(*y*) PORTULACACEAE.—Species about 200, natives of Asia, Africa, Madagascar, America, Australia, and New Zealand. Plants of various habit, usually herbs or undershrubs.

(lvi) *Portulacaria afra*, Jacq. (Spekboom, Elephants' Food).—A tall succulent shrub with small fleshy opposite leaves. Found abundantly in the eastern Karroo, and forms one of the most valuable stock-food plants in times of drought.

(*z*) RUBIACEAE.—A large family of over 5,000 species, especially abundant in tropical countries. The members of the family are herbs, shrubs, or trees with opposite leaves. The two most important genera are *Cinchona*, which yields quinine, and *Coffea*, the seeds of which furnish the coffee of commerce.

(lvii) *Rubia cordifolia*, Linn. (Indian Madder).—A small herbaceous plant, common in parts of Natal and the eastern areas of the Cape Province. The long cylindric roots yield a dye. The true Indian Madder is *Rubia tinctorum*, from which formerly the dye alizarin was extracted.

(lviii) *Vangueria infausta*, Burch. (Mispel, Wild Medlar).—A bush, from 3 to 10 feet high, found in the Transvaal, Natal, and Rhodesia. The fruit is highly flavoured and is collected for local use.

(*aa*) RUTACEAE.—Trees or shrubs, rarely herbs, usually with gland-dotted and aromatic leaves. Species about 700, found in all warm and temperate countries, but most numerous in South Africa and Australia. Several species are used medicinally. The genus *Citrus* yields important fruits—orange, lemon, citron, etc.

(lix) *Barosma betulina*, B. and W. (Round-leaved Buchu).—A small aromatic bush found abundantly in the Cedarberg Mountains in the Clanwilliam District. The leaves contain an essential oil and yield the "buchu" leaves of commerce. Another species, *B. crenulata*, Kuntze, is also exploited for its leaves, but these are not considered so good as those of *B. betulina*.

(lx) *Calodendron capense*, Thunb. (Cape Chestnut, Wilde Kastanje).—A large and ornamental tree found in the south-eastern districts of the Cape Province. It produces a large woody fruit covered with protuberances and which contains shining black seeds. The seeds yield an oil of the non-drying type and suitable for soapmaking.

(*bb*) SANTALACEAE.—A temperate and tropical family of about 400 species, comprising herbs, shrubs, and trees of varying habit, often parasitic. Represented in South Africa by the genus *Thesium* and several smaller genera. The valuable sandalwood is furnished by a species of *Santalum*.

(lxi) *Osyris Abyssinica*, Hochst. (Bergbas, Transvaal Sumach).—A common bush in the Transvaal with greyish glaucous leaves. The leaves are used for tanning.

(*cc*) SAPINDACEAE.—Species over 1,000, distributed in tropical and subtropical countries. Usually trees or shrubs of varying habit; poorly represented in South Africa. Some members of the family yield timber, others edible fruits.

(lxii) *Pappea capensis*, E. and Z. (Bergpruim, Kaambessie, Olie Pitten).—A shrub or small tree of the eastern Karroo. The seeds, which are contained in a small globose fruit, yield about 47 per cent. of oil of a non-drying type, and suitable either as a lubricant or in the manufacture of soap.

(*dd*) SAPOTACEAE.—Trees or shrubs with milky juice. Species about 400, mainly confined to the tropics. Many species furnish gutta-percha.

(lxiii) *Chrysophyllum magaliesmontanum*, Sond. (Stamvrugte).—A small tree found chiefly on the Magaliesberg Range. The fruits which are borne on the old branches make an excellent preserve.

(lxiv) *Mimusops obovata*, Sond. (Moepel, Rooi Melkhout).—A shrub, extending from the Uitenhage district through the eastern districts of the Cape Province into Natal, and Transvaal. It bears a large edible yellow fruit.

§ 11. Fauna.

1. **General.**—South Africa is rich in certain groups of the animal world; although with the advance of settlement and colonization the numbers, particularly of certain classes, are being rapidly reduced. This is more especially the case with the magnificent game animals or antelope. Much of the present knowledge of the *fauna* of the country is due to the early investigators, notably the Swedes—Sparrman, Thunberg, Wahlberg, Victorin, and C. J. Anderson, the German—Lichtenstein—and the Englishmen—Barrow, Burchell, Sir A. Smith, Layard, Trimen, and Selous.

An article descriptive of the fauna extant in South Africa, contributed by Dr. A. K. Haagner, F.Z.S., Director of the National Zoological Gardens, Pretoria, appeared in earlier issues of this *Year Book*. In the matter of game protection, South Africa has arrived at the stage where a self-consistent national policy should be formulated. On the one side, the march of civilization is making the maintenance of large herds of our indigenous fauna more and more difficult. Ranching is economically a doubtful proposition when grazing has to be found for large numbers of wildebees, zebras, etc., in addition to cattle. On the other hand, certain of our rarer types of game are in danger of entire extermination. The first of these two aspects is alluded to below in connexion with the Transvaal Game Laws. On the second, an article appears in Section 3 of the present paragraph by the Director of the National Zoological Gardens, Pretoria.

2. **Game Preservation.**—The preservation of game is dealt with by the Provincial Administrations. In the *Cape of Good Hope* the preservation of game is regulated by Act No. 11 of 1909, those parts of the First Schedule to Ordinance No. 16 of 1920 entitled "Game" and "Wild Ostriches", Ordinance No. 10 of 1911, Ordinance No. 17 of 1918, and Ordinance No. 7 of 1920. Game is fully protected in the Province, and the close seasons, which vary as to period according to area, occur generally within the interval 1st July to 30th April. Any person desirous of shooting or capturing Royal or Big Game (except such as may be exempted under Act No. 11 of 1909) is required to obtain an ordinary game licence, a Royal Game licence, and a special permit from the Administrator. The following species of Royal Game are found in certain areas:—Elephant, eland, zebra, buffalo, bontebok, blesbok, gemsbok, hartebees, koodoo, rietbok, wildebees, and klipspringer. Permits to shoot or capture elephants, elands, or zebras are only issued under the most exceptional circumstances. The undermentioned birds and animals are specially included as game with respect to certain districts:—Namaqua partridge, wild duck and geese, snipe, coot, flamingo, ant-bear (*Orycteropus capensis*). The shooting of game is prohibited in the Game Preserves situated in the Province.

In *Natal* the first game law was enacted in the year 1866, the close season being fixed from the 15th August to the 30th November in each year. Eighteen years later the close season was altered so as to commence on the 1st July and terminate on the 31st December. Law No. 16 of 1891 enacted that the close season should be from the 16th August to the 30th April, and heavy penalties were provided for trapping game, while a law promulgated in 1894 limited the discretion of the Governor to permit the destruction of Royal Game to the open season only.

In Zululand a close season for game from the 1st August to the 31st March was established in 1890, and in 1897 the first game reserves were demarcated, though hunting in them was allowed by permit. In 1903 the Giant's Castle Game Reserve was established with the special object of preserving the few eland still to be found in Natal. The Natal and Zululand game laws were consolidated in 1904, and a uniform close season from the 16th August to the 30th April was fixed, the destruction of all but the smallest game with a shot-gun being prohibited. The employment of natives to hunt game otherwise than as beaters was made illegal; stamp duties on licences for certain game were imposed, and

the Governor no longer exercised the function of issuing permits for the destruction of absolutely protected or Royal Game.

In 1911 a Game Conservator for Zululand was appointed with headquarters at Nongoma.

An Ordinance to amend the laws relating to game was passed in 1912 and practically consolidated all previous legislation on the subject. The game was divided into three classes, viz., ordinary or small game which can be shot during the open season (1st May to 15th August) on payment of the sum of £1; specially protected game in respect of which varying fees for the different animals are payable, and Royal Game which may not be destroyed at any time, except for scientific or certain public purposes on special permit. Special provision is made by the Ordinance for the destruction by owners or occupiers of land of ordinary or specially protected game during the close season, where damage to standing crops, plants, or trees can be proved, and for the killing by residents in Zululand of a limited number of game for food, more especially during times of scarcity due to failure of crops.

In the game reserves no hunting is allowed, and the Administrator is empowered to establish or abolish such reserves from time to time. Five such reserves are at present demarcated, of which the principal are the Giant's Castle where eland are to be found, and the Mkuzi which shelters the inyala (a buck which at one period was threatened with extinction), the impala, the Zululand suni or Livingstone antelope and other game.

In addition to those already mentioned, game reserves have been established at the request of the owners on two farms in the Klip River Division and one in the Umgeni Division.

The penalties involved for contraventions of the *Game Ordinance* range from fines of £20 to £200, with the alternative of periods of imprisonment extending from one month to two years.

Owing to the existence of the tsetse fly or Nagana disease in cattle the provisions of the *Game Ordinance* have been relaxed considerably in Zululand since the year 1915, and the fees payable in respect of specially protected game much reduced. The country has been divided into open areas, special shooting areas, and game reserves.

The animals classed as Royal Game and which may not be captured or destroyed except by special permit for approved scientific institutions or to serve some public purpose comprise the white rhinoceros, elephant, roan antelope, sassaby, blesbok, springbok, and females of the eland, impala, and inyala, as well as the crested crane and Stanley crane, and the klipspringer and oribi (in Zululand only).

In the *Transvaal* game legislation restricting and regulating the destruction of wild animals and birds is contained in Ordinance No. 6 of 1905, as amended by Acts Nos. 13 and 30 of 1907, Act No. 11 of 1909, Ordinances No. 21 of 1917 and No. 9 of 1918.

The "Big" Game of the Transvaal Province comprises the larger and rarer animals and birds, including roan and sable antelope, inyala, gemsbok, sassaby, koodoo, hartebees, zebra, wildebees, ostrich, and crested crane. The elephant, rhinoceros, hippopotamus, buffalo, and eland are now practically unknown in the Transvaal except in the game reserves. In respect of the *blue* wildebees, representations were made by the farming community in certain districts in the Transvaal that this animal, which was fairly abundant, was communicating "snot-siekte" to domesticated cattle, and after enquiry into the facts had been made, the animal was removed by Proclamation, dated the 13th June, 1925, from the schedule of big game in the districts of Pietersburg, Waterberg, Zoutpansberg and Potgietersrust (excluding the Transvaal Game Reserve) and put on the schedule of game which may be hunted during the open season.

Lions and leopards are not classed as game, but are regarded as vermin. Ordinary game consists of all Transvaal varieties of the smaller and more common kinds of buck, hares, and the warthog; also the following birds:—All Transvaal varieties of pheasant or francolin, partridge, sandgrouse, guineafowl, wild duck, and wild goose. No game may be shot or hunted without a game licence by any one except the owner or lessee of a farm on which the game is pursued and, of course "open" varieties only may be shot. Big game may not, under severe penalties, be shot or hunted without a special big game licence issuable only by the Administrator. A game licence only entitles the holder to shoot game during the open season. There is a uniform open season for small game throughout the Province, usually 15th April to 31st August. The big game season is from the 1st June to 31st August. A game licence may restrict the holder to destroying only a given number of either or both sexes of any kind of game. The destruction of any particular kind of game may be restricted throughout the Province or in any particular district for a given period. The possession of a game licence does not give the right to pursue or destroy any game so protected, neither can the owner or lessee of a farm destroy game so protected on his farm. Certain areas are proclaimed as game reserves in which shooting and hunting are entirely prohibited.

There are three game reserves in the Province where shooting and hunting are absolutely prohibited. They are the Pretoria Reserve, the Transvaal Game Reserve, which was formerly known as the Shingwedzi, and the Sabie Reserve.

In the *Orange Free State*, Ordinance No. 13 of 1914, which took effect on the 21st August, 1914, consolidated and amended the laws with reference to the protection of the several kinds of wild animals commonly known as *buck*, comprehending the whole antelope species and including the wildebees or gnu, the several kinds of birds, not being domesticated, known as ostrich, paauw, korhaan (bustard), guineafowl, partridge (francolin), pheasant, dikkop, goose, duck, coot, plover, lapwing, snipe, and other water fowl and any other wild animals or birds which the Administrator may, from time to time, by proclamation declare to be game. The period between and including the first day of August in any year and the last day of March in the succeeding year is the close season for game. The Administrator is also empowered to prohibit the hunting of any kind of game or of any other wild animals or birds for any period not exceeding three years in any district of the Province.

As to the Royal game, no person, whether an owner of land or not, is allowed to hunt at any time any locust bird or, without the written permission of the Administrator, any hartebees, koodoo, or eland or any other animal or bird which the Administrator may at any time by proclamation declare to be Royal Game.

A game reserve has been established by the Provincial Administration on the Somerville Estate in the Winburg district, which was handed over to the Province for that purpose by the Department of Lands in December, 1924. The principal kinds of game at present found on the reserve are blesbok and springbok. A limited number of shooting permits are issued annually from the office of the Provincial Secretary.

3. **Some of the Rarer Game Animals of South Africa and the need for their Protection.***—Several of the most interesting forms of the larger mammalian fauna of South Africa have already disappeared from the face of the earth. Their lamentable extinction was caused by man. The true quagga—an animal resembling the zebra, but striped only as far as the shoulder—disappeared in a wild state about 1870. It was the southern representative of this lovely group of equines and was slaughtered by the white colonists and natives. To-day only eighteen mounted specimens exist in the museums of the world. The bloubok was a large antelope related to the roan and sable antelopes of to-day, and disappeared from South Africa in 1800, only eight mounted specimens being in existence in European museums. How many people of South African birth will ever get the chance to see these two extinct animals of their own land? Several other species are in danger of extermination and efforts should be made to save them before it is too late.

The *true* white rhino exists only in a scattered state in Zululand, the reserve which they occupied having been done away with; and there cannot be more than thirty in existence. The colonists seem determined that the last one shall go, blaming these mighty animals (the second largest terrestrial mammal living to-day), amongst others, for the stock disease known as nagana. Formerly this animal was common all over South Africa, and as far as one can judge by present appearances, the species is doomed unless superhuman efforts are made to save it.

The black rhinoceros still exists in fair numbers in parts of Rhodesia and South-West Africa, but only a few are found in the Sabie Reserve and in the Zululand Reserves. It seems almost certain that the latter will in course of time disappear, and then what is to become of the black rhino and the beautiful nyala antelope is difficult to foretell. The nyala is only found in the thick bush of the coastal districts from Zululand to Portuguese territory, and there is supposed to be a small patch in Nyasaland inhabited by this species. It is very localized and affects thick bush, but nevertheless it is becoming very scarce in Portuguese territory, where the natives possess rifles and trap game wholesale. If the Zululand Reserves are all deproclaimed this lovely creature will also be doomed to extinction.

The bontebok and the mountain zebra of the Cape only number a few hundred individuals each, and no reserve exists wherein they can carry on. The farmers of the Cape are now making a dead set against the mountain zebra, want them removed from their farms, and are agitating for permission to destroy them. As they live on the mountains, it is not clear what damage they can do—at any rate to such an extent that they must be destroyed. The bontebok has only been saved by the praiseworthy efforts of a few of the old Cape farmers and is found to-day only on a few farms in the Bredasdorp district of the Cape Province. If a small Government Reserve could be set aside for these two species, they might be saved to the South African nation.

The eland is only found in South Africa to-day in Rhodesia and parts of Bechuanaland. There are a few in the Giant's Castle Reserve in Natal, and also a few in the Shingwedzi Reserve of the Transvaal. The Vaal rhebok is getting very scarce, and the mountain ranges of the Drakensberg which at one time contained a large number is to-day almost devoid of this peculiar antelope. With its woolly, fur-like hair and stilted gallop, it is one of the most interesting forms we have, but legislation protecting it has done little towards preserving the species, owing to the poaching proclivities of the inhabitants, both white and black. The little oribi of the flats is in much the same state. Usually mistaken for a

*By A. K. Haagner, Sc.D., F.Z.S., Director, National Zoological Gardens of South Africa and President, Transvaal Game Protection Association.

steenbok, it receives scant mercy from the so-called sportsman, and its only hope of survival lies in the Sabie Reserve, but here again the area occupied by these little antelopes is in danger of being deproclaimed.

The true grysbok of the Cape is getting scarcer every year, and its supposed fondness for the tender shoot of the grape vine does not, of course, protect it or assist in preserving it from wanton destruction.

The farmers are the people who can, and should, assist the nation in the preservation of its fauna, especially in regard to the smaller varieties, while the reserves will ultimately be the only places wherein the larger animals can be saved. For this reason it has been the long-cherished idea of the Transvaal Game Protection Association to see the Sabie and Shingwedzi Reserves of the Transvaal, and at least one of the Natal Reserves, nationalized by Act of Parliament so that they will remain for all time a sanctuary in which our wonderful and varied fauna may live and multiply in an undisturbed and natural manner, and in which the townsman, the naturalist, the school teacher, and above all the children of the country can view the four-footed inhabitants of their land, and can gain some idea of what sunny South Africa was like in the old "Voortrekker" days before the advance of civilization and agricultural pursuits forced the game animals to retire, or to die out altogether. After all, these beautiful forms were created for us by Nature and were left in trust for us by our forefathers. This trust should be just as sacred to us, and it behoves us to see that the heritage left us by our fathers should be handed on to our sons. One generally realizes the real value of what one has lost when it is too late, and it is to be hoped that the powers that be will do all they possibly can to ensure that the various forms of animal life that are to-day in danger of extermination, shall be given a fair chance to survive.

§ 12. Climate and Meteorology.*

1. **Historical Sketch of Meteorological Development in the Union.—Cape Colony.**—Although occasional notes on the outstanding features of the weather—droughts, gales, floods, etc.—prevailing at Table Bay, are to be found in the journals of the early Dutch Commanders or Governors at the Cape, the first regularly kept record of meteorological phenomena seems to have been that of M. l'abbe Nicolas Louis de la Caille, taken at Cape Town, from 1st July, 1751, to 30th June, 1752. The results of his observations are contained in the second of three memoirs communicated to the Academy of Sciences of Paris, and are contained in the volume for 1751, published in 1755. A perusal of this most interesting memoir shows de la Caille to have been a keen and accurate observer of Nature, while his graphic description of the phenomenon associated with the summer "South-Easter" is an accurate description of what occurs at the present day. It was not until about the year 1818 that the Colonial Government began to show some interest in the meteorology of the Cape Colony and instructions were then given to their officers in the country districts to make observations and to transmit their registers to Cape Town. Apparently barometers and thermometers were supplied to a number of places in the south-west and south, but of the type of instruments, the mannner in which they were exposed, or the necessary corrections, no information is available. A number of these meteorological registers were printed in the *Government Gazette*, between September, 1818, and June, 1825. The stations from which records were received were Cape Town, Zwartland (or Malmesbury), Stellenbosch, Tulbagh, Swellendam, George, Uitenhage, Bathurst, Worcester, Albany, and Clanwilliam. The majority of these records are from Cape Town, and contained the maximum and minimum temperatures and pressure for each day, as well as two observations of wind and weather. The observers were most active during the years 1821–23, but appear gradually to have lost interest, until observations were discontinued altogether after 1825. In the year 1827, the Royal Observatory, near Cape Town, was established, and since that time meteorological observations on a more or less complete scale have been carried out there.

On the establishment of the South African Institution, Cape Town, in 1831, the subject of meteorology was again taken up more systematically, and matters of some permanent interest are to be found in reports of the committee of that body between 1831 and 1837; but, as apparently no provision was made for the replacement of broken instruments, the work of observation was gradually discontinued. During the years 1834 to 1838, meteorological observations were made by Sir John Herschel, near Wynberg, but these have never been published.

In 1835 the South African Institution enjoyed the advantage of the presence and aid of Sir John Herschel, who became its president. He prepared a series of instructions for taking observations and analysed and discussed the returns from different stations,embodying some of his results in an article on "Meteorology" in the Encyclopaedia Britannica.

In 1841 a Meteorological and Magnetical Observatory was established at the Cape and placed under the direction of Captain Frederick Eardly Wilmot, R.A. This observatory, was erected in the Royal Observatory grounds, and hourly observations made from October

* Contributed by Mr. C. Stewart, B.Sc., Chief Meteorologist of the Union (with the exception of paragraph 14).

1841, to July, 1846. In the year 1846, on the withdrawal of Captain Wilmot, the meteorological work was placed under the direction of the Astronomer Royal. Observations have been continued there since that period, but are now only taken three times daily, viz., at 8.30 a.m., local mean noon, and 8.30 p.m. An examination of portion of the earlier observations for 1835 show that these possess but little scientific value, and although Dr. John Crounbie Brown in his book, "Water Supply of South Africa," gives the total annual rainfall for the years 1838 to 1841, the latter year may be regarded as the real beginning of satisfactory observations at the Cape.

Evidently recognizing the importance of a proper survey of the possibilities of the country, the Government made a second and more serious attempt in 1860 to investigate its climate and a Meteorological Committee was appointed by Government Notice No. 363, dated the 26th October, of that year. A very good beginning was made by distributing instruments consisting of a standard barometer, a dry bulb, wet bulb, maximum, minimum, and solar radiation thermometer and a rain gauge to the following ten stations which were fairly typical of the whole Colony: Clanwilliam, Simonstown, Somerset West, Mossel Bay, Graaff-Reinet, Colesberg, Grahamstown, and Queenstown.

Soon afterwards the excellent plan was initiated of supplementing the data obtained from these stations by records of maximum and minimum temperatures, from what would now be termed Third Order or Climatological stations, while the necessity for a wider distribution of rain gauges was also realized and apparently acted upon. It will thus be seen that even at this early date there was a division of stations into the same three classes that obtain at present. The first report was published in 1862, but a subsequent report for 1864 was rejected by the committee as inaccurate.

Notwithstanding the excellent start of a proper plan of campaign for investigating the climate of the Cape Colony, the enthusiasm with which the work was originally undertaken seems to have gradually declined; broken or defective instruments were not replaced, with the result that the observations at most stations were very incomplete after 1868.

In 1874 the Meteorological Committee was resuscitated or reorganized with the title of Meteorological Commission. With the appointment of this Commission, a period of progress and expansion was initiated which although slow at times, continued until its automatic dissolution in 1912. The success attending the efforts of this Commission may be attributed in great part to the personnel composing it at various times, many of whom took a real interest in the work and had broad and far-seeing views as to its requirements, as well as paying attention to essential details. Thus, shortly after its re-formation, the Commission began to realize the necessity for providing proper shelters for the uniform exposure of thermometers, and the original small pattern of "Stevenson Screen" was adopted with greatly improved results. With the advent of Mr. J. G. Gamble, Hydraulic Engineer to the Colony, in 1887, there was begun the establishment of stations equipped with rain gauges only, on a more liberal scale than was possible with the other types of stations. In 1879, with the appointment of the late Sir David Gill, Astronomer Royal, as a member of the Commission, the important step of providing for the inspection of stations was taken, thus greatly enhancing the value of the observations, so that the service soon began to assume a satisfactory character. Upon the suggestion of the Astronomer Royal, anemometers of the Kew pattern were erected in 1882, at the Royal Observatory and East London, and in the ensuing year at Port Elizabeth and Durban. These were intended to be used in conjunction with tide gauges, in connection with a tidal survey of the coast of South Africa, then being carried out on the proposal and under the direction of Sir David Gill. The original siphon barometers in use being found very unsatisfactory, they were replaced by the "Kew" pattern of marine barometer. Attempts were made to introduce self-recording barometers and thermometers, but on being tested, most of them proved unreliable and the idea was abandoned. The subject of evaporation also began to receive some attention. New instructions for observers, applicable to the recently adopted types of instruments, were prepared and the results of observations were issued yearly as a separate publication from 1875 to 1908 inclusive, when they were discontinued. In fact, all the energies of the Commission were devoted to improving the existing organization so as to render it more efficient and at the same time to bring it into line with international usage. In dealing with the development of meteorology in South Africa, it is impossible to avoid mentioning the establishment about 1896, of the De Beers' first order station, then the only one of its kind, at Kenilworth, near Kimberley. This station is under the management of Dr. J. R. Sutton, whose valuable contributions to the South African Philosophical Society (now the Royal Society of South Africa), the quarterly journal of the Royal Meteorological Society, and other publications have thrown a great deal of light on some of the many problems of plateau meteorology, as well as removing a number of erroneous impressions derived from the discussion of previous observations of a less complete character.

Natal.—Observations of rainfall were apparently first started at Pietermaritzburg in the year 1854, but the name of the pioneer observer is unknown. The meteorology of Natal will, however, always be associated with the name of Dr. R. J. Mann, M.D., who not only established his own station at Maritzburg but discussed very fully and in an interesting

manner, the results for various portions of the period 1858–1867. His numerous papers on the climate of Natal were mainly contributed to the British Meteorological Society, whilst a work entitled "The Colony of Natal," compiled and edited by him, was published in 1859. Rainfall was also measured at several other stations in the Colony, but it was not, seemingly until 1870, that observations of pressure, temperature, etc., were started in other parts of the Colony. In January of that year a complete set of instruments was being read at Bushy Park, near Durban, but these were apparently transferred in February, 1872, to a new position on the Berea, Durban, where the work was continued. In 1873, the same instruments were installed at the Natal Botanic Gardens, Durban, where observations were carried on until 1883. With the opening of the Astronomical Observatory at Durban in 1884, under Mr. E. Nevill, the work was taken over by that institution, and until the year 1908 the results of these observations were included in the annual reports of the Government Astronomer. In 1892, five additional stations equipped with rain gauges and thermometers were started at five magistracies, chiefly on the coast, viz., at Stanger, Verulam, Umzinto, Port Shepstone, and Polela. These subsidiary stations were gradually increased in number to thirty-two, and the results included in the annual reports.

Orange Free State.—The first known observations in the Free State were those taken at Bloemfontein in 1878—consisting of pressure, temperatures, etc.—and with the permission of the Orange Free State Government were sent to the Cape Meteorological Commission, for inclusion in its annual report for that year. The next year similar data for Bloemfontein were supplemented by rainfall data for the four stations Kroonstad, Boshof, Ladybrand, and Philippolis. These rainfall stations were subsequently increased to ten or a dozen, but fluctuated from year to year, and the resulting data were included in the Cape Commission's yearly reports. This state of affairs continued until 1903. From this year the number of stations was rapidly increased, until they exceeded 250 rainfall stations, including 13 temperature stations, 9 of which also had barometers. Tabular statements of the results were incorporated in the annual reports of the Agricultural Department for the period 1st July, 1904, to 30th June, 1909.

Transvaal.—The early stages of the development of meteorological observational work in the Transvaal seems to have been closely associated with the gold-mining industry. The earliest series of rainfall observations of which there is any record were those begun at Pilgrim's Rest in January, 1885, closely followed by those at Barberton, commencing in January, 1888, and at Johannesburg (Joubert Park) in January, 1889. The first Government rain gauge erected in the Transvaal was most probably that on the roof of the Old Government Buildings, Pretoria, the first record from which was for the month of November, 1894. The only barometric and thermometric station known to have been in operation about this time was that at Joubert Park, Johannesburg, from 1893. On the appointment of Mr. (now Dr.) R. T. A. Innes to the post of Director of the Transvaal Meteorological Department in 1903, the work of establishing stations in all parts of the Transvaal was carried out with such energy and enthusiasm that in seven years' time close on 700 stations were in working order. Another very important step was the establishment of a First Order station equipped with self-recording instruments at Johannesburg. This observatory was first occupied in May, 1904, and is still the only official station of its kind in the Union. In 1912, about two years after Union, the meteorological services of the four Provinces were amalgamated under an official having the title of Chief Meteorologist of the Union and the office was attached for financial purposes to the Department of Irrigation. Since then the work of unification and development has been carried on steadily and at the end of March, 1925, the following was the numerical distribution of stations in the various Provinces:—

Province.	First Order Stations.	Barometric Stations.	Thermometric Stations.	Rainfall Stations.	Totals.
Cape	—	26	61	1,063	1,150
Natal	—	8	27	175	210
Orange Free State	—	5	13	646	664
Transvaal	1	50	55	896	1,002
	1	89	156	2,780	3,026

In addition to the above, there were co-operating with this office 10 stations in Basutoland, 3 in Rhodesia, and 32 in South-West Africa. The autographic instruments in use consist of 10 anemographs, 30 barographs, 14 thermographs, 13 hygrographs, and 15 sunshine recorders, but, unfortunately, the present staff is insufficient in number to enable the work of reducing the records from these instruments to be carried out. Since the amalgamation of the services of the different Provinces, further development has been taking place in the organization of a system of daily forecasts, as well as of upper air observations.

Forecasting.—In the early eighties, attempts were made to forecast the weather over the Cape Province, but owing in large measure to the paucity of data, this was discontinued. In 1883, the Cape Meteorological Commission organized a system of simultaneous observations at 8 a.m. Cape mean time of $22\frac{1}{2}°$ east longitude of pressure, temperature, winds, etc., at ten stations situated mainly on the coast and the results were transmitted by telegraph to Cape Town. After the necessary reductions to sea-level, etc., the corrected readings were sent to each of the coast ports, where they were entered on a sketch map of the coast-line for the information of mariners and others. It was hoped by these means to discover some of the laws governing the coast weather, or at any rate the paths of storm centres, and so lead to the issuing of storm warnings. In 1884, a similar system of inland *weather messages* was started by the Government Astronomer in Natal. The data supplied consisted of the direction and force of wind, the state of sky, the approximate amount of rain that had fallen, as well as the time of maximum intensity of any thunderstorms since the previous observation. In 1900, a separate system of *weather messages* from about forty inland stations was started for the benefit of the Cape Agricultural Department. In 1905, on the occasion of the visit of the British Association for the Advancement of Science to South Africa, the writer stated in an article contributed to "Science in South Africa," that investigation had led to the conclusion that the depressions that visit South Africa are generally not fully developed cyclones but rather V-shaped depressions and wedges, whilst a large proportion of our rainfall occurs in connection with "secondaries." Further, that the types of barometric depressions approximate more to those that visit Australia than to those of Europe.

In 1906, the Transvaal Meteorological Department began issuing daily forecasts for the Transvaal. Owing to the height of the stations being known only approximately, the forecasts were based on a system of departures from the monthly normals. On the unification of the various meteorological services, forecasts were extended so as to include the whole Union. The first general forecast was issued on the 23rd May, 1912. This work has throughout been considerably handicapped by an absence of good reporting stations in the western, that is, the more arid portions of the Union, as well as the continued absence of reliable information as to the height above sea-level of most of the stations. As time went on, it became more and more evident in attempting to draw the daily isobars that we were dealing only with fragments of the various high and low pressure systems, and it was resolved to extend the area covered by the isobars by inviting the co-operation of adjoining territories, more particularly Portuguese East and West Africa, Madagascar, Mauritius, etc., as well as the assistance of ships equipped with wireless apparatus belonging to the various companies whose vessels visit South African waters. This extended system came into operation about the beginning of December, 1923, and has helped to throw a considerable amount of light on the extent of the various high and low pressure systems affecting South Africa. In October of 1924, there was started the further innovation of broadcasting a summary of the weather conditions prevailing at 6.30 a.m. Greenwich mean time at the principal coast stations between Mozambique in the east and Loanda in the west. These reports are broadcasted for different sections of the coast by the wireless stations at Mozambique, Lourenco Marques, Durban, Port Elizabeth, Cape Town, and Walvis Bay; also special forecasts for the coast by the last four wireless stations. A separate forecast for the interior, with temperature and rainfall data for the telegraph reporting stations in each Province, as well as similar information collected for the principal towns of the Union, is distributed by telegraph throughout the country and copies are also supplied to the principal newspapers for publication.

A good deal of information concerning the weather experienced off the coast of South Africa will be found in the earlier volumes of the quarterly journal of the Royal Meteorological Society, as well as in the publications of the Meteorological Office of Great Britain. Among the more important of these may be mentioned "Meteorological Charts of the Ocean District Adjacent to the Cape of Good Hope" with remarks thereon in a separate volume (No. 43 of Meteorological Office publications, 1882); "Report of the Gales Experienced in the Ocean District Adjacent to the Cape of Good Hope," by Captain Toynbee (No. 44 of Meteorological Office publications, 1882), as well as in the more recent publication, "Meteorological Charts of the Southern Ocean between the Cape of Good Hope and New Zealand" (2nd edition, 1907); also some of the papers of Commander Campbell, M. W. Hepworth, and various other publications of European countries, particularly those of the Meteorological Institute of the Netherlands, Utrecht.

Ocean Circuit.—Charts showing the surface currents, winds, distribution of ice, etc., over the adjacent oceans have been published from time to time by the British Admiralty, Meteorological Office, and other institutions of various countries. Between 1900 and 1906, the Cape Meteorological Commission carried out some investigations of the littoral urrents by means of bottles, set adrift from the Union-Castle boats at fourteen different points round the coast. Some of the results obtained were published in a paper entitled "Currents on the South African Coast as indicated by means of Drift Bottles."* At the same time surface temperatures of the sea were taken at a number of coast stations as also from the vessel "Pieter Faure" at different depths. A paper dealing with some of the results was issued by Dr. Gilchrist, under the title "Observations on the Temperature and Salinity of the Sea around the Cape Peninsula." (Department of Agriculture, No. 10, 1901.)

Upper Air Observations.—The first "Pilot Balloon" ascent for determining the direction and velocity of the air at various altitudes was carried out on 18th June, 1918, at Pretoria, by Mr. G. W. Cox; these observations have been continued at the Capital up to the present time. During the recent experimental air mail service, observations of the upper currents by this method were carried outat five coast stations, mainly from the middle of April to the middle of June of the year 1925. The results from these stations are in course of preparation. A further advance in upper air research was made on 18th February, 1922, when a "Sounding Balloon" carrying instruments for obtaining records of pressure and temperature was set free. Five more were despatched on the "International Days" in May of the same year, but only two of these were recovered. The results of these ascents were published in the Monthly Weather Report for May, 1922.

Publications.—The meteorological services of the various Provinces discontinued publishing the results of observations a year of two before Union, in anticipation of some material alteration being effected in the form in which the blue-books would be issued after that event. In 1912, it was proposed, in view of many of the reports of all Provinces being out of print, that all available data to 1910 should be prepared on a uniform basis and issued as a special publication under the title of the "Climatology of South Africa," while reports should be issued for each subsequent period of five years. Although the first portion of this scheme was duly carried out, no funds have yet been provided for publication. After amalgamation a short summary of weather conditions for each month was prepared and published in the *Government Gazette*, together with data for a small number of selected stations distributed over the Union. Since January, 1920, this form of publication has been altered and a separate small brochure entitled the "Monthly Weather Report" issued instead. This contains a summary of the leading features of the weather of each month, tabular statements of temperature and rainfall, etc., for a number of stations distributed as uniformly as possible over the Union, and is illustrated in each case by isohyetal and isobaric maps. Articles dealing with various matters that have formed the subject of special investigation are published in various journals from time to time, as well as those in the Official Year Book to which alterations and additions are made in practically each issue with the object of bringing the information as far as possible up to date.

2. **Meteorological Organization of the Union.**—Particulars of the Meteorological Service of the Union are given in the fifth issue of this *Year Book*.

3. **General.**—Although the Union of South Africa is situated between the fairly low latitudes of 22° and 35° S., its climate is cooler than that met with in similar latitudes in the Northern Hemisphere. In point of fact, the various parts of the sub-continent have a mean annual temperature corresponding to that found in Europe 7° to 10° further from the Equator. This amelioration of climate is mainly due to two causes: (1) the configuration of the country, and (2) the comparatively small land area, which admits of the winds from the vast surrounding oceans exercising a moderating influence over the country. Topographically, the Union of South Africa may be regarded as consisting of a series of four elevated plains or plateaux separated from each other by steep escarpments rising to a considerable elevation above the plains. This division into plateaux is most apparent on taking a section across the country from south to north, but is not so well defined on proceeding from the east or west. These plateaux are as follows:—

(1) The Coast Plateau or Coast Flats having an average elevation of 500 to 600 feet and varying in width from about thirty miles in South-West Africa to three or four or even less in the south-east of the Cape Province.

(2) The Southern or Little Karroo, a narrow table-land about fifteen miles in width, crossed from east to west by a series of parallel mountain ranges separated by narrow valleys; its average elevation is about 1,500 feet and it is separated from the coast belt by the Langeberg and Outeniqua Ranges.

(3) The Central or Great Karroo has an average elevation of between 2,000 and 3,000 feet. It is bounded on the west by the Cedarberg and Bokkeveld and on the south by the Witteberg, Zwartberg, and Zuurberg Ranges.

* By J. D. F. Gilchrist, M.A., B.Sc., Ph.D. (Marine Investigations of South Africa, Department of Agriculture, No. 21, 1902).

(4) The Northern Karroo or High Veld is the innermost plateau, comprising the greater part of the remainder of the Cape Province, the Orange Free State, and the major portion of the Transvaal. It is encircled on the west, south, and east, practically from the Limpopo to the Orange River, by the mountains of Namaqualand, the Roggeveld, Winterberg, Stormberg, and Drakensberg ranges, constituting the great escarpment. This plain has an elevation of about 4,000 feet rising in the north-eastern portions to 6,000 feet in the Transvaal High Veld, and 10,000 to 11,000 feet in Basutoland, and forms the main watershed of the country.

Outside of these areas lie the Transvaal Low Veld, Swaziland, Natal, Zululand, and the eastern uplands of the Cape Province, the native territories of the Transkei, the mountainous south-west, including the Cape Peninsula, and the west coastal area. The greater portion of South Africa has an elevation of over 3,000 feet, whilst the area below 1,500 feet consists merely of a narrow fringe around the coast.

4. **Temperature.**—Certain tables giving statistics of mean temperatures were published in Year Book No. 7. Owing to the plateau structure of South Africa, there is a gradual increase of altitude with decrease of latitude from the coast to the interior. The most noteworthy effect of this formation is a remarkable uniformity of mean annual temperature over the greater part of the Union. Thus, Cape Agulhas, the most southerly point in lat. 34° 50′ S. and 55 feet above sea-level, has a mean yearly temperature of 61·5 degrees, whilst Johannesburg (Joubert Park), in the Transvaal High Veld, in lat. 26° 11′ S., and at an elevation of 5,750 feet, has an annual temperature of 60·6° F., a difference of only 0·9° F. Again, considering the two capitals, Cape Town, in lat. 33° 56′ S., altitude 115 feet, at the south-western extremity of the country, has an average of 62·6° F.; whilst Pretoria, situated in a shallow valley in 25° 45′ S., at a height of approximately 4,400 feet, has a mean temperature of 63·5.° These temperatures are practically the same as the summer temperatures of England and about the same as those of many of the best-known health resorts of the Mediterranean, including the Riviera.

The warmest place in the Union is found in the Transvaal at Komatipoort, on the border of Portuguese East Africa, in lat. 25° 26′ S.; here at an elevation of 460 feet above sea-level the mean annual temperature is 73·1°. The coldest station is Disa Head, 2,496 feet, on Table Mountain, in the Cape Peninsula, where the yearly mean is only 54·7° F. There is thus a difference of only 18·4° between the warmest and coldest parts of the Union.

Places having a yearly temperature of 71° or over are confined to the coastal area of Natal and Zululand, together with the Low Veld in the eastern and northern Transvaal. On the other hand, annual temperatures of 60° or under are met with mostly at the stations on the eastern border of the Free State, in Basutoland, and along the southern border of the Free State and the adjoining portion of the Cape Province, the south and west of the northern Karroo, the coast of Namaqualand, the Warm Bokkeveld, in the south-west of the Cape Province, the higher portions of the Transkei and Zululand, and the eastern portion of the Transvaal High Veld.

5. **Hottest and Coldest Months.**—Notwithstanding the remarkable uniformity in these yearly temperatures, a considerable diversity in this important element of climate is exhibited by its variation throughout the year. These variations are fairly well indicated by the mean annual range, that is, by the differences between the hottest and coolest months. Seeing that the seasons in the Southern Hemisphere occur in the inverse order to those of the Northern Hemisphere, December to February constituting the summer and June to August the winter months, it follows that the coolest month is either June or July and the warmest, January or February, when the fruit season is at its height.

So far as has been ascertained up to the present, the annual range of temperature is least (5·9°) at Port Nolloth, on the west coast, where with an annual temperature of 57·5°, February the warmest month has a temperature of only 60·1°, whilst July the coolest month has a temperature of 54·2°. Contrasted with this, Fraserburg, in the northern Karroo, altitude 4,200 ft., has a mean annual temperature of 58·6°; January the warmest month has a temperature of 72·8° and July the coldest, 43·4°, giving a mean annual range of 29·4°. Between these two extremes of mean annual range, intermediate values are found, as a general rule increasing from the coast inland, being greater, however, in valleys than on mountains.

The mean annual range of the greater part of the Union of South Africa is practically the same as that of Great Britain, where the annual range varies from 14·5° at Lerwick, in the Shetland Isles, to 25·0° at Greenwich and 25·5° in London (Camden Square).

6. **Mean Diurnal Range.**—As indicated by the mean maxima and minima, the mean diurnal range shows considerable variation in much the same way as the mean annual range. Speaking generally, the mean daily range increases from the coast inland, Basutoland, the Northern Border and Bechuanaland having practically the same, and that the highest average value, viz., 31° to 32° F. The mean daily range, on the whole, is least (16·2°) over the Cape Peninsula and greatest (31·6°) in Basutoland. The smallest

range hitherto noted for an individual station is 10·4° at Cape Agulhas, the most southerly point of the Union, and the largest (35·2°) at Umsinga, on fairly level country, at an altitude of over 3,000 feet, in lat. 28° 42′ S. and long. 30° 28′ E.

The mean daily range, generally speaking, increases with increasing distance from the sea. Other factors come into play, however—such as situation, whether on a plain, on a mountain, or in a valley. On comparing the diurnal range of the hottest month with the coldest it is found that in the west the range is greater in summer than in winter; at a certain position the range is practically the same in both seasons; whilst in the eastern half of the country the range is greater in winter. This corresponds practically with the areas of winter and summer rainfall.

7. **Extremes of Temperature.**—Mean maximum temperatures of 90° and over are mostly confined to the three months December to February and are found in Natal, the eastern low veld of the Transvaal, the northern border of the Cape (west of the Orange Free State), and Clanwilliam, in the Olifants River valley, in the west coastal area of the Cape Province. Similar temperatures may be looked for in the Limpopo Valley, in the north of the Transvaal, but no data are yet available for that area. These high mean maxima occur first in November at Ladysmith and Umsinga, in Natal, and continue at Clanwilliam from January to March. Mean minimum temperatures of 32° F. or lower are met with during June and July along the southern and eastern edges of the innermost plateau; that is, the eastern portion of the Transvaal High Veld, the east of the Orange Free State, the lower portions of Basutoland, and contiguous portions of the north-east of the Cape Province, together with the south and west of the northern Karroo; over the last section, and in parts of Basutoland, mean minimum temperatures below freezing-point are continued into August. Similar conditions prevail during June and July in the north-east of the Orange Free State and the adjoining border of the Transvaal. Further south at Bloemfontein (Orange Free State) and Hopetown, in the northern border of the Cape, such means are limited to the month of July. The highest mean maximum is 94·3° for January at Ladysmith (Natal), and the next highest 93·9° for the same month at Kenhardt, in the Cape; whilst two years' records at Leribe, in Basutoland, give a mean minimum of 19·3° for July, with 25·3° in June, the next lowest mean minimum being 26·4° in July at Hanover, in the northern Karroo.

Temperatures of 90° to 95° are of frequent occurrence at most stations during the summer months, whilst 100° and over occasionally occur, particularly at valley stations near the coast, at the foot of the plateaux, and even at stations of 4,000 to 4,500 feet or lower altitude in the more northerly portions of the country. These high temperatures, however, last but a short time and are usually succeeded by thunderstorms with ensuing cool nights. Cases of sunstroke are comparatively rare, even Europeans working in the open fields without any special precautions. The extremes hitherto recorded are the exceptionally high maximum of 125° F. at Main during the prevalence of a hot wind on 28th January, 1903, and the unusually low minimum of 6·0° F. at Palmietfontein (Cape) in June, 1902, after the severe snowstorm of 9th to 12th June of that year. The absence of extremely low temperatures is due not only to the comparatively small land-area enabling the moderating effects of the sea to be felt practically all over the Union, but also to the shape of the sub-continent, which becomes wider from south to north.

8. **Frosts.**—Air temperatures below freezing-point, occasionally as low as 15° to 10° F., are liable to occur at inland stations between April and October, but more particularly between the end of May and the middle of September. As a matter of fact, frost is liable to occur in the interior during every month of the year and even killing frosts as early as March and as late as the end of October or even in November. The danger of damage to fruit, etc., from this cause will be apparent when it is stated that the first almond blossoms open on the Karroo, on an average, on the 1st August, the peach on the 28th August and the pear three to four weeks later. Although frosts of a severity to freeze standing water are rare in the coastal belt, comparatively light hoar-frost is not uncommon, as it has been found to occur, on an average, on seventeen days in the course of the year, over the Cape Flats, in the neighbourhood of Cape Town, and at least once at Durban. Over the Great Karroo, there are about seventy days per annum on which ground-frost occurs; ninety-six in the north-east of the Cape Province and sixty-three days at Bloemfontein. A great deal, however, depends on the situation of the station, whether on a hill or slope, or in a valley, as is shown by there being only five days, on an average, with frost at the Union Observatory, Johannesburg, situated on a ridge at an elevation of 5,925 feet; frosts are much more frequent in the adjoining valleys. When ice has been formed at places in the interior, it usually disappears in the course of the day, to be reformed at night.

9. **Shade Temperatures of 32° F. and Under.***—The length of the period between which such temperatures are liable to occur is greatest over an irregular area in the more southerly

* Three maps illustrating the occurrence of frosts in the Union will be found in Official Year Book No 6, together with a detailed tabular statement showing the duration and distribution of frosts.

portions of the innermost plateau, and part of the central Karroo. This area may be roughly indicated by a line drawn from Sutherland, in the south-west of the northern Karroo, north-eastward to Griquatown, then south-eastward towards Aliwal North. From here the line sweeps to the north in a curve bulging westwards in the neighbourhood of Thaba 'Nchu, in the Orange Free State, and then southwards to Delemont, in the Division of Maclear; thence the enclosing line trends in a west-south-west direction back to Sutherland. Within this area the frost period is between five and six months, even exceeding seven months at Sutherland. From this area the frost period diminishes in all directions, forming a series of zones roughly parallel with the coast.

The frostless belt is widest in the east and west, consisting in the former direction of the greater part of the low veld in the Transvaal, and continuing fairly wide to just north of the Tugela River. From this point it continues as a narrow belt round the coast. In the east the continuity of this frostless zone is broken by a portion of Swaziland, where occasional frosts are liable to occur in a period of from 27 to 80 days.

From what has been said above, in paragraph 8, it is evident that had it been possible to take into account the distribution and dates of occurrence of hoar-frost, the period within whose limits frosts usually occur, would in all likelihood, have been extended by a week or fortnight each way, while the so-called "frostless area" would have been considerably decreased, if not obliterated altogether.

As far as temperature is concerned, the greater part of the Union of South Africa possesses a climate well adapted for Europeans. This statement is borne out by the large number of men who have survived and been actively employed in various occupations for ten to thirty years after their lives had been practically despaired of by their medical advisers in Europe; also by the magnificent physique of men born in South Africa.

The hottest spells are of short duration, and in consequence of the attenuated state and dryness of the atmosphere can be borne usually with a feeling of less discomfort than a hot summer day in London. Sunstroke is comparatively rare, field-work being carried on without any special precautions, whilst hydrophobia is unknown. Perhaps the most trying period up-country is about the month of October just before the summer rains begin. The highest temperatures of the year are frequently recorded about this period, the atmosphere, however, being cooled later in the season to a considerable extent by the frequent thunderstorms. What may be termed the unhealthy areas where malaria is prevalent are mainly the northern and eastern low veld of the Transvaal, parts of the middle veld, portions of Swaziland, the warmer coast lands of Zululand, and, in a less degree, those of Natal. Under improved sanitary conditions and with better drainage, however, a number of areas formerly considered unhealthy have become practically free from malaria, and others are improving from year to year.

10. **Rainfall.**—The broad features of the distribution of rainfall over South Africa in regard to both time and place were shown by means of two maps (published in Official Year Books Nos. 6 and 7, to which reference should be made), the one giving the average annual rainfall and the other showing the percentage distribution between summer (October to March) and winter (April to September). Generally speaking the amount of precipitation decreases from east to west with areas of heavier rainfall along the south coast and the south-west, including the Cape Peninsula. Quantities exceeding 70 inches occur over very limited areas; thus, in the north of the Transvaal, in the Zoutpansberg Division, the Woodbush Forest Station shows an average of 71·97 inches falling on 138 days of the year, occasionally 100 inches being exceeded in a year. Another outstanding wet area is that of Evelyn Valley, in the Amatola Mountains in the south-east of the Cape Province, where the average annual fall is 70·20 inches on 150 days of the year, also exceeding 100 inches in some years. By far the wettest area discovered up to the present time, however, is that of the mountainous districts of Berg River Hoek and Wemmer's Hoek, near Paarl, in the south-west of the Cape Province. A few years' observations taken here showed that several stations in this area have annual quantities in the neighbourhood of 200 inches. St. Michael's, on Table Mountain, shows an average of 74·75 inches per annum. Omitting Walvis Bay, where the average annual rainfall is about three-quarters of an inch, the driest station is Port Nolloth, on the west coast, south of the Orange River mouth, where the average for 35 years is only 2·17 inches on 17 days.

Natal (including Zululand) is the best-watered Province, as a whole, although comparatively small portions of the Cape and Transvaal have an equal and even greater precipitation; such areas, however, are too small to affect materially the general statement.* The driest areas with less than 5 inches per annum are found in the Cape Province along the west coast and the Orange River, the neighbourhood of Van Wijks Vlei, and the Gouph, in the south-west of the northern Karroo. The average annual rainfall for the whole Union is approximately 19 inches.

Considerable variations in annual rainfall are also met with at places within a few miles of each other. This is particularly the case in the Cape Peninsula. Thus, the Fire Station in Cape Town itself has an average fall of 25·64 inches, whilst Platteklip, about

* A table illustrating the general distribution of rainfall was published in Official Year Book No. 6.

1½ miles to the south-east, also in the Cape Town valley, on the lower slopes of Table Mountain, has an average yearly total of 45·12 inches, almost double the former amount. Again, Robben Island, in Table Bay, has an annual average of 18·24 inches; Camps Bay, at the foot of the Table Mountain, on its western side, 24·25 inches; St. Michael's, on Table Mountain (approximate altitude, 3,050 feet), 74·75 inches; whilst Newlands (Montebello), on the eastern side of Table Mountain, has an average of 66·07 inches; the horizontal distance between Camps Bay and Newlands being about 6 miles. The great variation in rainfall over the Cape Peninsula, shown on the diagram, is due to the influence of the Table Mountain Range to the west, the rain being largely orographic. Again, George, on the south coast at the foot of the Outeniqua Mountains, has an average of 34·36 inches, whilst Ezeljagt, about 12 miles distant, in a north-easterly direction, but on the north side of the same range, has only 14·98 inches or about two-fifths of the amount at George. The village of Balfour, Cape, at an elevation of 2,100 feet, has an average of 28·08 inches, whilst on the top of the Katberg, at a height of 4,490 feet, the average is 53·28 inches. Many more examples of such variations could be enumerated, but those given will suffice.

On calculating the percentage amount of the annual rainfall that occurs during the six warmest months (summer), October to March, and during the six coolest, that is, the winter months (April to September), it is found that the Union may be sub-divided into three regions:—

(i) *Summer Rainfall Area*, having over 50 per cent. of its total rainfall from October to March;
(ii) *Winter Rainfall Area*, having over 50 per cent. of the total from April to September; and
(iii) *Constant Rainfall Area*, having its precipitation equally divided between these two periods.

By far the greater part of the country receives the bulk of its rainfall in summer, the winter rainfall area being confined to a comparatively narrow strip parallel with the west coast and the constant rainfall area to a much smaller belt along the south coast. The remainder of the country falls within the summer rainfall area, the area in the north and centre of the Transvaal having 90 per cent. or more during summer. From this area the proportion falling during summer decreases, to south, east, and west, but more particularly from north-east to south-west. The 50 per cent. line runs in a general north-north-west and south-south-east direction from a little south of Walvis Bay to the neighbourhood of Swellendam, thence eastwards some distance inland from the south coast, terminating on the coast to the north of Port Elizabeth.

A good idea of the distribution of precipitation from month to month over the various parts of the Union may be gathered from the accompanying table showing the average monthly rainfall at 283 stations distributed fairly uniformly over the country.

Taking the country as a whole, the rainfall is at its maximum in March, then decreases to the minimum in July, after which it rises to a secondary maximum in November.*

South Africa, in common with all sub-tropical countries, is visited from time to time by droughts, which are occasionally of great severity. On mapping the deviations from normal of the rainfall of each year since 1878, it has been found that of the forty-three years actually examined, there was no instance in which the whole of the country suffered from a deficiency of rainfall, nor, on the other hand, was there a case, even in years of abundant precipitation, in which some portion of the Union did not show a shortage. It is evident, therefore, that if there should have been any year in the past in which an excess or deficiency of rainfall has been common to the whole country, or should this occur in the future, such an event must be regarded as exceptional and very unusual.

In addition to the average rainfall map which has appeared in several previous issues of the Year Book, there is published in this issue a rain map of the Union showing the intensity of the rainfall during the year 1924. The deviation from normal during the year can thus be readily observed.

11. **Thunderstorms.**—By far the greater portion of the precipitation over the summer rainfall area occurs in connection with thunderstorms, most of which appear to proceed from some westerly point of the compass. The thunderstorm-frequency curve is at its maximum in February and falls to a minimum in June, rising thereafter to a secondary maximum in October. In other words, the two maxima of the thunderstorm curve occur one month earlier than the two maxima in the rainfall curve.

Thunderstorms increase in frequency towards the interior. Thus, two stations in the southern Karroo gave an average of 5 to 6 thunderstorms per annum; one station in the central Karroo showed an average of 19 per annum; whilst at Johannesburg, on the High Veld, the average is 61 per year, although the lightning recorder there showed that this phenomenon occurred within the radius of the instrument on 569 days in a period of 5 years, giving an average of 114 per annum. Again, in the Cape Peninsula, lightning, not necessarily associated with local thunderstorms there, was seen on an average of 11 days in the year.

* Figures giving the mean annual rainfall at all Union stations of continuous standing for ten years and over were published in Year Book No. 5. Yearly records of rainfall in nine towns from the earliest date of observation were also shown.

12. **Intensity of Rainfall.**—Seeing that the greater part of the Union of South Africa receives the bulk of its rainfall during the summer months (October to March) when thunderstorms are most prevalent, it is to be expected that the intensity of the daily rainfall will be greater than in countries where precipitation is distributed more or less uniformly over the whole twelve months. That this is the case is well shown in the following table which indicates the mean percentage of the total annual rainfall over the central Witwatersrand, contributed by different daily amounts compared with similar data for Greenwich :—

COMPARISON OF INTENSITY OF RAINFALL OVER THE CENTRAL WITWATERSRAND, TRANSVAAL, AND AT GREENWICH, ENGLAND.

Amount per Day.	Percentage of Annual Rainfall.	
	Central Witwatersrand, Transvaal.	Greenwich, England.
Inches.		
0·01–0·10	6·64	16·18
0·11–0·25	13·09	27·97
0·26–0·50	23·57	30·78
0·51–1·00	33·52	20·03
1·01 and over	23·18	5·03

From the above table it will be seen that only 43 per cent. of the annual rainfall over the Witwatersrand occurs in showers of half an inch or less per day as compared with 75 per cent. at Greenwich. Quantities of 2 to 4 inches in one day are fairly common, having been noted, for example, ten times in eleven years at Johannesburg, whilst quantities exceeding 4 inches have been reported twice in the same period, the maximum in one day there having been 6·12 inches. Daily amounts exceeding 2 inches have occurred over the greater part of South Africa, with the exception, apparently, of the west coast. At many stations along the south and south-east coasts and for some distance inland, quantities of 5 inches and over have been recorded in one day, whilst amounts of 10 to 18 inches are not unknown between Durban and Swellendam. Further, quantities exceeding 20 inches have been registered as the result of two to three days' rainfall in the south and south-east, even in semi-arid areas, the fall in one day occasionally exceeding the average annual rainfall.* Very heavy rains in short periods, particularly during thunderstorms, occur all over the summer rainfall area. Rates exceeding 10 inches per hour have been reached for a few minutes, but quantities of about 4 inches have been actually recorded as a result of one hour's downpour. Such intense falls naturally result in floods which frequently cause considerable damage, particularly in low-lying lands and towns. Whilst floods over the summer rainfall area are mostly due to such heavy thunderstorm rains, they are also occasionally due to lighter prolonged precipitation over wide areas, as in the case of the Gamtoos River flood of May, 1916.

This intensity of the rainfall has an important bearing on agriculture as the amount of water that sinks into the soil is considerably decreased in comparison with that from lighter rains. On the other hand, the increased run-off from heavy showers enables water to be stored in dams, etc., for irrigation purposes, so that the water can be used for winter crops.

13. **Hail.**—This occurs principally in three different forms :—

(1) *Soft hail*, consisting of small, rounded pellets about the size of peas, opaque and white like compacted snow ;

(2) *icy pellets*, larger and more compact and transparent, like frozen raindrops ; and

(3) *true hail*, consisting of pieces of ice of irregular form, but mostly pear or mushroom shaped, with a central opaque nucleus, surrounded by a series of more or less concentric hard and soft, alternately clear and opaque layers. The outer layer of these hailstones frequently bears a series of tooth-shaped projections. These vary in size, frequently being described in the size of marbles, but occasionally the size of hens' eggs or even of oranges.

The first type of hail occurs mostly in showers in spring and sometimes in winter, when it is occasionally followed by snow. The second is mainly a winter phenomenon. True hail, on the other hand, is usually associated with thunderstorms and occurs mostly during the warmest time of the year. Although usually regarded as a summer phenomenon, such storms may occur during the winter months, as at Fauresmith, Orange Free State, on the 19th June, 1900.

* In previous issues (Nos. 1 to 5) are given diagrams for the Transvaal showing the probable maximum amounts of rainfall during various intervals up to two hours.

A fourth form of hail which is very exceptional, consists of irregularly shaped pieces of ice, like fragments of larger pieces which have been broken by collision with one another; these are occasionally long and narrow. This form has been noted in Pretoria, associated with true hail.

The average number of days throughout the year on which hailstorms occur over the Transvaal is 106, but the actual number has varied between 80 and 133; whilst over the Cape Province, where the actual number of days has varied between 73 and 131, the average number of days is 105. The following table shows the average number of days in each month on which hail fell at one or more stations in the Cape and Transvaal Provinces:—

AVERAGE NUMBER OF HAIL-DAYS IN EACH MONTH OVER THE TRANSVAAL AND CAPE PROVINCES.

Province.	Jan.	Feb.	March.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Year.
Cape.....	11·9	13·8	11·6	7·0	7·5	4·5	4·9	4·0	7·4	9·5	10·5	12·4	105·0
Transvaal.....	13·5	8·4	10·4	6·3	3·9	0·7	1·8	1·8	6·6	15·5	20·1	16·9	105·9

The number of hail-days is considerably greater during the winter months in the Cape Province than in the Transvaal, a condition which seems to be closely related to the greater amount of rainfall during winter over the Cape Province, than over the Transvaal. Hailstorms frequently cause considerable damage to fruit, crops, windowpanes, etc., even at times killing numbers of small stock; this is particularly the case in the Transvaal where these storms attain their maximum at the beginning of the growing season. Fortunately, they usually pursue a narrow path of limited extent so that occasionally only the crops in one portion of a farm are destroyed, the rest being left untouched.

14. **Hailstorm at Pretoria and Vicinity, 25th December, 1923.***—Probably no country in the world is more subject to hailstorms than South Africa, whose geographical position and topography—an extensive plateau some 4,000 ft. above sea-level, offer ideal conditions for their development. These storms are sometimes very severe, and it is proposed to give some description of one which visited Pretoria, on Christmas Day, 1923, and caused damage to property to the extent of £80,000.

On Christmas morning, the sky was obscured by clouds of the strato-cumulus type, and about noon a slight shower of rain fell. Subsequently there was a partial clearance, but at 6.25 p.m. the sound was heard of hailstones falling on galvanized-iron roofing. The sky to the south then appeared a mass of leaden cloud, except for a low layer in the fore-front which bore a reddish, coppery appearance. For a short time the fall of isolated stones continued at intervals of about three seconds followed by intense rainfall and again hail. The hail might have been mistaken for a shower of snowballs but for the deafening noise of impact on roofs and ground, the stripping of foliage and large branches from trees, the snapping of telephone wires as though they were threads, the smashing of windows and the perforation of tiled roofs like so much paper. This continued until 6.35 p.m., when the hail gave place to a heavy rainfall which completed the havoc. The water, pouring through the roofs, either found its way through the ceilings, or, by accumulating, caused their collapse. All information obtained from reliable sources as to the size of the hailstones agrees fairly well with official observations. One which was seen to fall and was under observation until it could be recovered with safety, measured 4 by $3\frac{1}{2}$ by 2 inches, and weighed 5·1 oz., eight others together weighed 1 lb. 15 oz., or an average of about 4 oz. each. All these stones were collected from a space measuring 30 by 40 ft. and the weight was obtained by melting and measuring in a c.cm. measure glass. In structure, the stones showed considerable divergence. The largest was composed of small stones about the size of small marbles frozen together. One, almost a perfect sphere, with a diameter of about $2\frac{1}{2}$ inches, had the appearance of tightly packed snow throughout, while another, also spherical, and of about the same dimensions, had an opaque nucleus and three concentric opaque layers separated by clear layers. The outside was clear ice about $\frac{1}{8}$ inch in thickness. Another with a fairly flat stone as centre had a circle of large stones around it, their shapes being such as to give the impression that they were originally spherical, but had been distorted until they fitted together round the centre disc to form one complete mass.

At 7.17 p.m. the centre of the storm was to the north, and the cloud in its rear had a movement from west to east. At the surface was a rising current in which condensation was taking place at a few hundred feet, and this was travelling rapidly from north-east to south-west towards another storm in the south. The appearance was that of smoke passing out of one storm towards another. With the advance of this second storm, rain again began at 7.30 p.m., and at 7.49 p.m. lightning was overhead. With the first storm

* Contributed by G. W. Cox, Scientific Assistant, Meteorological Office.

there was little lightning, with the second there was no hail but very intense lightning. At 8.20 p.m. when the rain had ceased to a drizzle and the centre of the second storm was some distance to the north, 360 flashes of lightning were counted in three minutes. Rain ceased at 8.34 p.m. and at that time lightning was again visible on the southern horizon. Fortunately this third storm passed to the east at about 11.30 p.m. when the autographic records in the city showed a rise in pressure, fall in temperature, and a change in direction and increase in the velocity of the wind. This ended a memorable day and looking back it is very hard to understand why no human life was lost. The horn of a cow struck by a hailstone was broken off at the root, and 22-gauge corrugated iron sheets were pierced by the impact.

Of the two storms which actually passed over Pretoria, the first had its origin at 4.30 p.m. at Bedford Farm, four miles to the east-north-east of the Union Observatory, Johannesburg, where its presence was indicated by a slight fall in temperature and change in wind direction from north to north-east by north accompanied by a decrease in velocity from fifteen to eight miles per hour. At Bedford Farm the total precipitation was 1.28 inches with only a little hail. First proceeding for seven miles in a north-easterly direction, the storm turned northwards to Kempton Park and then continued to move towards the north throughout its course. The hail was not remarkable at Kempton Park, and at Irene, after the storm had traversed twenty-three miles, the stones were only the size of peas and marbles. At Pretoria, thirty-one miles from the point of its origin, the stones had assumed the dimensions already described, but the maximum intensity of the storm seems to have occurred some distance to the north. Only 800 of the 15,000 tiles on the roof of the school at Wonderboom escaped damage; and at "Ons Plaas," six miles to the north-north-east of the city, two head of cattle and many fowls were killed, pigs were drowned, crops completely destroyed and mature trees stripped of all foliage and bared of their bark. The second storm passed the Union Observatory at 5.51 p.m. and was accompanied by a slight rise in pressure, veering of the wind from north-north-west to east-south-east, and decrease in velocity from sixteen to eight miles per hour. This storm seems to have been fairly innocuous over a large part of its track, but at Irene hailstones the size of a golf ball fell, destroying fruit and crops and smashing windows. At Oliphantsfontein stones fell the size of a goose-egg, destroying all fruit and crops, but it cannot be decided to which storm these can be attributed.

A few miles beyond Pretoria the separate existence of the two storms cannot be determined, and it is necessary to treat them as one. When the farms Honingnestkrantz and Roodewal were reached, forty-four miles from Bedford Farm, little hail fell, but the strength of the wind had increased, and the same conditions prevailed at Pienaar's River, where the wind caused considerable damage to property. Beyond this point the storm decreased rapidly in intensity, and died out after having travelled ninety-four miles. The hail belt was sixty-nine miles in length, with a breadth of fifteen miles in the vicinity of Pretoria; the rate of travel of the first storm was seventeen miles per hour, and of the second nineteen.

The passage of a third storm is shown by Johannesburg records and this was probably the same which was seen to the east of Pretoria at 11.30 p.m. There also seems to have been a succession of storms of great severity over the path this one pursued, and at one place all crops were destroyed, trees uprooted, and iron roofing pierced by hailstones. Further to the east, other storms can be traced, and the records showing the rainfall during the day over the thunderstorm area conveys a correct impression of what occurred over the eastern half of the Transvaal, if it is borne in mind that the storms moved from south to north, and that more than one storm traversed each track.

15. **Snow.**—Falls of snow are comparatively infrequent and usually confined to the mountainous districts. Snow is rarely met with on the coastal flats, as may be appreciated from the statement that it was seen even on Table Mountain (Cape Town) on only seven occasions in forty-four years; whilst falls were recorded on the high veld (Transvaal) in only eleven out of fifty-seven years. This form of precipitation, however, is much more frequent on the mountains in the east of the Cape Province, where it may be seen at least three or four times each winter.

16. **Winds and Wind Velocities.**—This subject was dealt with in Official Year Books Nos. 6 and 7, and illustrated fairly extensively by means of tables, graphs, and diagrams containing data collected in respect of six of the principal meteorological stations in the Union. Descriptive accounts of the vagaries of and destruction caused by storms of high wind velocity were given, and reference should be made to these previous issues for information on the subject.

17. **Hot Winds.**—All along the coastal districts, and inland near the foot of the plateau, hot, dry winds are experienced, considerably affecting the temperature curve. These "Berg Winds," as they are termed along the south coast, cause at times a practical inversion of the seasons, the maximum temperatures recorded during the winter months being frequently 15 to 25 degrees higher than in summer, whilst the mean temperature

is also considerably raised. They may blow for only a few hours or may continue for two or three days in succession producing a feeling of great oppression ; when the wind changes its direction, it brings cool, cloudy weather and occasionally rain with a welcome feeling of relief. As these winds owe the greater part of their heat to being warmed by compression in passing from the elevated table-land in the interior to the low coastal lands, the directions from which they blow, being more or less at right angles to the coast-line, depend on the direction in which the escarpment and mountain ranges extend. Thus, they are easterly along the west coast from Walvis Bay southwards, northerly to north-westerly (very seldom north-easterly) along the south coast and inland to Stutterheim ; and north-westerly at Durban. They also appear to blow with greatest frequency in different months over different areas. Thus, they are most frequent in the winter months along the west and south coasts at least as far as Blaauwkrantz, forty miles east of Knysna ; at East London there are two maxima, one in the late spring and the other in early autumn, whilst at Durban they are confined mainly to the spring and early summer.

The following tabular statement of the average number of these hot winds occurring in each month at Blaauwkrantz (Division Knysna), in the south coast division of the Cape Province during the ten years 1891–1900, and at Pietermaritzburg, in Natal, during the eight years 1858–1865, will serve to bring out the essential differences in their seasonal distribution at these two places :—

Station.	Jan.	Feb.	Mar.	April.	May.	June.	July.	Aug.	Sep.	Oct.	Nov.	Dec.	Year.
Blaauwkrantz.....	0·1	0·2	0·4	1·3	2·9	4·1	5·2	3·9	1·4	0·2	0·2	0·0	19·9
Pietermaritzburg*....	1·5	1·2	0·7	0·9	1·2	0·9	2·4	3·2	5·1	4·2	3·0	1·7	26·0

* The Pietermaritzburg data have been extracted from Dr. Mann's paper on " Atmospheric Pressure in Natal," Proc. Brit. Met. Soc., Vol. III, p. 345.

The above table shows that at Blaauwkrantz these " Berg winds " are most frequent between May and August, with a maximum in July, whereas at Pietermaritzburg the period of greatest frequency is from August to November, with the maximum in September, two months later than on the south coast.

During a hot north-north-west to north wind on the 22nd January, 1923, a maximum temperature of 117·5 was recorded at Uitenhage and 118·0 at Dunbrody, both in the Uitenhage Division in the south of the Cape ; as a result of this intense heat, mealie and other crops were destroyed, while some cattle, ostriches, a large number of fowls, small birds, and bees died.

18. **Duststorms.**—One of the most disagreeable features in the South African climate is undoubtedly the duststorms which occur all over the country. They are most frequent during the second half of the year, usually starting in August when the high pressure over the interior is beginning to break up ; they are also frequently associated with the forefront of advancing thunderstorms so common over the summer rainfall area. The fine dust, raised by a strong squally wind, rises as an enormous, thick cloud, almost blotting out the landscape, and penetrating everywhere. Fortunately, these duststorms seldom last for any length of time and are usually followed by rain.

19. **Evaporation.**—All over the Union evaporation from free water surfaces is found to be largely in excess of the average annual rainfall. A table showing the monthly recorded results at three widely separated centres was published in issues Nos. 6 and 7 of this Year Book. The annual figures were as follows :—

	Johannesburg. (Union Observatory.)	Cape Town. (Molteno Reservoir.)	Dunbrody. (Near Port Elizabeth.)
	Inches.	Inches.	Inches.
Evaporation.....	74·67	78·57	72·19
Rainfall.....	30·73	33·25	14·88

20. **Sunshine.**—The average number of hours of bright sunshine experienced in each month at Cape Town, Kimberley, and Johannesburg, as compared with similar data for other parts of the world, are given below.

MEAN DAILY HOURS OF SUNSHINE.

Month.	Cape Town (Royal Observatory).	Kimberley.	Johannesburg (Union Observatory).	London.	Bucharest.	Calcutta.	Baltimore.	New York.	Cordoba.

The largest proportion of possible sunshine at Cape Town occurs during the summer months, whilst at Kimberley the reverse is the case, the largest proportion occurring during the winter months. It is, therefore, possible to live in South Africa in practically continuous sunshine, e.g. by spending the summer months in the Cape Peninsula and the winter months on the High Veld, where the skies are then practically cloudless and the climate ideal, although the night temperatures frequently fall below freezing-point.

21. **Upper Air Research in South Africa.**—An interesting note contributed by Mr. G. W. Cox, Scientific Assistant, Union Meteorological Office, on the results of researches into the direction and velocity of upper air currents, made by means of pilot balloons, appeared in Official Year Book No. 7, but has had to be omitted from the present issue out of considerations of space.

§ 13. Observatories.

A. THE UNION OBSERVATORY.

[Longitude, 1h. 52m. 18·0s. E.; Latitude, 26° 10′ 55″·3 S.; Altitude, 1,806 metres.]

UNION ASTRONOMER: R. T. A. INNES.

1. **Institution and Development.**—By Government Notice No. 612 (1/5/12) notification was given that the Transvaal Observatory would be known as the Union Observatory under the charge of the Union Astronomer. The Observatory was instituted in 1903, when, as a result of a petition presented by the South African Association for the Advancement of Science, the Governor of the Transvaal decided to form a Meteorological Department for that Colony. The Director of Meteorology was appointed in April, 1903, and the headquarters of the Department, the Transvaal Observatory near Johannesburg, were officially opened on the 5th January, 1905, by Lord Milner, in the presence of Sir David Gill, then H.M. Astronomer at the Cape, the Mayor of Johannesburg, and representatives of the scientific and technical societies of the Transvaal.

From 1903 until 1910, the Transvaal Meteorological Department published annual volumes (7) of meteorological results compiled from data collected by voluntary observers in all parts of the Province. In 1911 the Government decided to consolidate the meteorological services of the Union in the Irrigation Department (Meteorological Branch), and at the same time desired that the Transvaal Observatory should concentrate and develop its operations on the astronomical side, the title of the Transvaal Observatory being changed to that of the Union Observatory, the Transvaal Meteorological Director becoming the Union Astronomer. The Union Observatory still maintains its own meteorological observations, and as such it is still the only official meteorological station of the first order* in the Union.

The following tables containing data for the years 1923–24 and 1924–25 are a continuation of a summary of the records of rainfall and temperature observations made at the Observatory without a break since 1904. The figures for prior years will be found in previous issues of this *Year Book*.

* FIRST ORDER stations are those making continuous records of the chief meteorological elements.

(iii) EXTREME TEMPERATURES RECORDED AT THE UNION OBSERVATORY.

Year.	Highest Recorded.	Lowest Recorded.
	°	°
1923–24	89·5 on 18th Jan., 1924	28·2 on 25th June, 1923
1924–25	84·8 on 20th Jan., 1925	26·0 on 1st Sept., 1924
Period 1904–05 to 1924–25	90·1 on 5th Jan., 1920	22·8 on 27th June, 1921

NOTE.—The thermometers are exposed in a Stevenson screen. The 31st January and the 1st March are added to February in order to make the division of the year more even. January, February, and March thus have thirty days each except in Leap Year, when February has thirty-one days.

2. **Instruments.**—In 1910, Weichert seismographs were installed, by which all great earthquakes in any part of the world, as well as the smaller local tremors due to the effects of mining, are automatically recorded.

In 1907 the Witwatersrand Council of Education, Sir David Gill and others provided the Observatory with a 9-inch refracting telescope made by Sir Howard Grubb, of Dublin. This instrument was afterwards taken over by the Union Government. In 1909 a

deputation from the South African Association for the Advancement of Science waited on the Transvaal Minister of Lands (The Hon. J. F. B. Rissik) to ask the Government through him to provide the funds for a powerful refracting telescope. The request was acceded to and the Transvaal Parliament having voted the required expenditure, a 26-inch refracting telescope was ordered from Sir Howard Grubb in 1909. Through unexpected difficulties in casting the optical glass for the objective, the telescope was unfinished when the War began and its completion had to await the termination of hostilities. Further difficulties arose through the greatly increased costs of material and work, and the manufacture of a suitable flint disk for the object-glass also gave rise to delays. The telescope was received from the manufacturer towards the end of 1924 and was erected and brought into use in 1925. The clear aperture of the object-glass is 26½ inches.

A 10-inch astrographic camera and a twin-telescope (object-glasses, 6 and 7 inch) with a 6-inch prism were presented by the late J. Franklin-Adams, of London. The Observatory possesses the collection of clocks, chronometers, and other miscellaneous instruments usually found in such institutions.

A wireless set by which time-signals from all parts of the world can be heard is installed and time-signals from Bordeaux and other stations are regularly received.

3. **General Operations.**—Official Time in South Africa (Standard Time of the 30th meridian east of Greenwich) is supplied to the Cape Province and the Orange Free State by the Royal Observatory, near Cape Town, and to the Transvaal and Natal by the Union Observatory.

With the Franklin-Adams Star-Camera, photographic plates covering the whole sky have been taken, the plates covering that part of the sky north of the equator having been taken in England before the telescope was presented to the Union Observatory. All these plates were sent to England and copies of them are made and sold by the Royal Astronomical Society (London).

The instrument is constantly at work, new plates being taken on all favourable occasions. On these plates many celestial objects are recorded, including variable stars, comets, minor planets, the fainter satellites of Jupiter and stars with large proper motion. Amongst the new minor planets found on these plates are Transvaalia (715), Mancunia (758), and Franklina (982); others are so far unnamed. A series of charts from these plates is being prepared on a scale of 36 mm. = 1°, showing all stars to about the 14th or 15th magnitude between Dec. — 19° and the South Pole. These charts as issued are distributed to the leading observatories of the world.

With the 9-inch refractor nearly 700 new double stars have been found and measured. Observations of the chief satellites of Jupiter have been made regularly since 1908. With the twin-telescope the spectra of the brighter stars have been photographed with dyed plates so as to obtain more of the red end of the spectrum than can be got with ordinary plates. The Union Observatory possesses in its blink-microscope one of the most potent of the more modern instruments of astronomical research. With this instrument it is possible to compare two celestial photographs of the same region of the sky with speed and precision, no matter how crowded with stars the plates may be. With its use plates taken at different times are rapidly searched for planets and variable stars, or if the interval between the exposures amounts to years, for stars with proper motion. The Observatories at Greenwich, Paris, Algiers, the Cape, Sydney, and Melbourne have lent many pairs of their astrographic plates with time intervals up to twenty-five years for examination, and numerous examples of large proper motions have been found—mainly in the cases of very faint stars.

The Union Observatory publishes at irregular intervals a circular containing the results of the work it is doing. Up to January, 1925, sixty-two of these circulars had been distributed to other astronomical observatories and institutions.

4. **Visitors.**—Upon written application visitors are admitted to the Observatory on Wednesday evenings and are shown celestial objects through the 9-inch telescope. Senior classes of schools are also shown over the Observatory in the day-time. In 1924 the number of visitors was about 1,500.

B. ROYAL OBSERVATORY, CAPE TOWN.

The Royal Observatory at Cape Town was instituted by an Order-in-Council, dated the 20th October, 1820, as the result of a memorial presented by the Lords Commissioners of the Admiralty. The present buildings erected on grounds covering twenty-seven acres consist of the Meridian Observatory and ten other detached observatories for use with various instruments; together with residences for the staff and other necessary buildings. The following instruments form the present equipment:—

(i) A transit circle.
(ii) A reversible transit circle.
(iii) The McClean telescope (aperture 24 inches).
(iv) Two equatorials (7 inches and 6 inches aperture) each with Repsold micrometer.

(v) A heliometer (7 inches aperture).
(vi) A theodolite (3 feet diameter).
(vii) A zenith telescope (4 inches aperture).
(viii) A photo-heliograph.
(ix) A photographic telescope (13 inches aperture), and other physical, meteorological and geodetic apparatus.

The following are the names of H.M. Astronomers from the date of institution :—

1820—Rev. F. Fallows.
1832—Thos. Henderson.
1833—Sir Thos. Maclear.
1870—E. J. Stone.
1879—Sir David Gill, K.C.B.
1907—S. S. Hough, M.A., F.R.S.
1923—H. Spencer Jones, M.A., B.Sc.

The names of Maclear and Gill are intimately associated with the most important geodetic operations carried out in South Africa.

The observatory is under the control of the Admiralty and, in addition to carrying out its original task of observing southern stars for the purpose of assisting navigation, has developed into one of the chief observatories of the world. The fundamental instrument is the transit circle, which is used for accurate determinations of positions of stars and incidentally for giving South African Standard Time throughout the Cape Province. Special time signals are also sent daily to the various ports, and every evening a wireless time signal is transmitted to ships at sea through the medium of the wireless station at Slangkop. It was at the Cape Observatory that the idea of employing the telescope for the determination of accurate star positions by means of stellar photography first took practical shape in 1882. The development of this resulted in (i) the Cape Photographic Durchmusterung, a photographic catalogue of nearly 400,000 stars and (ii) the international survey of the heavens, in which many of the principal observatories of the world are co-operating. The Cape contribution to the *Carte du Ciel* is a catalogue of about half a million stars. The Victoria telescope is used for the spectroscopic determination of the motions of stars in the line of sight. It has also afforded a further determination of the solar parallax, confirming previous Cape results derived by older methods for this most important astronomical constant. Observation of comets, of occultations of stars by the moon, and heliometer observations of planets are undertaken regularly. Photographs of the sun and meteorological observations are also taken and a continuous record of earthquakes is obtained on the seismograph.

The staff is constituted as follows :—

H.M. Astronomer..... H. Spencer Jones, M.A., B.Sc.
Chief Assistant..... J. K. E. Halm, Ph.D.
Assistants..... J. Lunt, D.Sc.; R. Woodgate.
Secretary..... A. Pilling, B.A.

There are also nine junior assistants and six temporary clerks, three artificers and a carpenter; with three Kroomen, detached from H.M. Naval Yard.

C. The Yale Telescope.

During his visit to Johannesburg, the Prince of Wales, on 23rd June, 1925, formally opened the new southern station of the Yale University Observatory and set in motion the driving mechanism. This station is located on the grounds of the Witwatersrand University, in Milner Park, Johannesburg. Its equipment consists of a photographic refractor of 26 inches aperture and 36 feet focal length, to which is attached a 10-inch visual lens of the same focal length. The total moving parts weigh about twelve tons, the telescope being the largest of its kind south of the equator. It is specially designed for the rapid and accurate photography of celestial objects.

This station was established primarily for the determination of the distances of southern stars, though other investigations bearing on the structure of the universe are contemplated. A knowledge of the distances of the stars is of prime importance in astronomy. While relatively simple in theory, such measurements are inherently difficult owing to the minuteness of the quantities to be measured. At the beginning of the present century, the distances of only a hundred stars were known with any satisfactory degree of precision. At the present time, owing to the application of photography with telescopes of long focus to the problem, the distances or parallaxes of about two thousand stars are known. These stars are mainly in the northern hemisphere where many observatories are actively pursuing this line of research.

The programme of the Yale telescope calls for the taking and measurement of about thirty thousand photographs. These will yield the distances of approximately fifteen hundred stars, most of which are inaccessible to northern observers. The Yale telescope is at present the only instrument south of the tropic of Cancer systematically engaged in the measurement of stellar parallaxes. The completion of the contemplated programme will extend our information regarding the brighter stars to the whole sky. The telescope will also be used for other investigations as the need for them becomes manifest.

D. VARIATION OF THE MAGNETIC COMPASS OVER SOUTH AFRICA.*

The problem of finding the direction of *true* North at any place is one which arises very frequently. The use of the magnetic compass affords a rough method of solving this problem, but a knowledge of what is termed " the variation of the compass " is essential to the solution.

The magnetic poles of the earth do not coincide with the geographical poles. The South Magnetic Pole is roughly in Latitude 72° South, Longitude 155° East. As a result of this the compass needle does not indicate True or Geographical North and South, but points to the Magnetic Poles and indicates Magnetic North and South.

The angle between the direction of True or Geographical North and Magnetic North is termed the " variation of the compass " or the " magnetic declination." This angle is unfortunately not at all constant. It changes from place to place and its value at any place also changes with the time. The secular change of the magnetic declination is due to a progressive shifting of the positions of the magnetic poles. Moreover, the direction in which the compass needle sets is greatly influenced by the presence of magnetic ores in the ground, and in several parts of South Africa magnetic bearings are quite unreliable for this reason.

A magnetic survey of South Africa was carried out by Professor J. C. Beattie† (now Sir Carruthers Beattie) about 1903, and has been partly repeated in later years.‡ From the results of these surveys magnetic maps for South Africa have been published for the epochs 1st July, 1903, and 1st July, 1913. These maps give the values of the chief magnetic elements all over South Africa, but these values only refer to the dates of the maps. The values for other dates may be obtained by making use of the annual rate of change of the elements, as determined by their respective values in 1903 and 1913. Over the greater part of South Africa the westerly declination is decreasing at the rate of about one degree in six years. Since this annual change is itself subject to variation, the predicted values of the magnetic declination for various places in South Africa (given in the attached table) cannot be considered as very trustworthy, but will be sufficiently accurate for rough purposes.

No magnetic observations have been made in South Africa since 1915, and it is now quite time that a further magnetic survey was carried out.

It is interesting to note that the magnetic declination was zero over South Africa in 1620, i.e. the compass needle then pointed to true North. From that time the magnetic needle has deviated increasingly to the West of true North, reaching a maximum deviation of 30° West in 1875. The westerly declination is now decreasing at the rate of about one degree in six years.

TABLE SHOWING THE DEVIATION OF THE COMPASS NEEDLE WEST OF TRUE NORTH FOR PLACES IN SOUTH AFRICA FOR THE DATES 1ST JULY, 1903, 1ST JULY, 1913, AND PREDICTED VALUES FOR JULY, 1926.

	1903.	1913.	1926.
	° ′	° ′	° ′

CHAPTER II.

CONSTITUTION AND GOVERNMENT.

§ 1. Early Governmental and Judicial Administration.

An extensive article, written by Mr. C. Graham Botha, Chief Archivist of the Union, on the Development of the Governmental and Judicial Administration of the Cape of Good Hope under the aegis of the Dutch East India Company, the Batavian Republic, and British régimes, appeared in issue No. 7 of the *Official Year Book*.

§ 2. Constitutional Development.

1. **General.**—In reviewing the constitutional history and development of the Cape of Good Hope, Natal, Transvaal, and Orange Free State, it must be noted that the movements which were consummated in the union of these States in 1910 may be traced back at their furthest to a period when the principles which characterize them lay at the root of the constitutional struggles of Western Europe, where in due course they were elaborated. and at length secured general acceptance. The *Cape of Good Hope*, with a constitutional history extending over a relatively long period, was influenced in its modern developments by the liberal tendencies which in England found expression in the Reform Acts and the Durham colonial system. The constitutional movement in *Natal* followed closely that in the Cape, allowances being made for the difference in age of the two colonies. The *Transvaal* and the *Orange Free State* possessed under the Republican régime constitutions which were to a large extent related to the neighbouring systems, and the form of Government which they acquired after the war of 1899-1902 was of the type already proved in the Cape and Natal.

It was principally in the case of the local government institutions that developments of a distinctive character may be noticed—fostered as they were by the existence of small communities widely separated, and to a large extent free from central control. This circumstance forms a very important factor in the whole history of the South African States and the present Union.

An account of the constitutional development of the four States which now comprise the Union was given in the sixth and earlier issues of this Year Book. The chronology of the movement which ended with the Union constitution adopted in 1910 will be found embodied in Chapter XXVIII.

2. **The Union of South Africa.**—The constitutional basis of the Union of South Africa is contained in the South Africa Act of 1909, a summary of which is given hereunder. The full text of the Act was reproduced in issues 1 to 5 of this Year Book. A schedule of the legislation amending, modifying, or defining certain provisions of the Act is given on page 78.

SYNOPSIS OF THE SOUTH AFRICA ACT, 1909, AND AMENDMENTS.

[Sections marked with an asterisk * are referred to in the table of amending, modifying, or definitive legislation given below.]

PART I—PRELIMINARY (SECTIONS 1 TO 3).

*§ 1. Acknowledgment of Sovereignty and Guidance of Almighty God.

§ 2. The words "The Union" are to be taken to mean the Union of South Africa, and the words "Houses of Parliament," "House of Parliament," or "Parliament" to mean the Parliament of the Union.

§ 3. The provisions referring to the King are to be extended to his successors.

PART II—THE UNION (SECTIONS 4 TO 7).

*§ 4. The Colonies of the Cape of Good Hope, Natal, the Transvaal, and the Orange River Colony are to be united by Royal Proclamation into a legislative union at a date not later than one year after the passing of the Act. The Government and Parliament are to have full power within the limits of the Colonies, but the King is to appoint a Governor-General.

§ 5. The provisions of the Act are to take effect on and after the date appointed.

§ 6. The four Colonies are to become the original Provinces with the same limits as the respective Colonies.

§ 7. All Acts applying to any Colony as being self-governing or with responsible government are to cease to apply to that Colony on its entering the Union.

PART III—EXECUTIVE GOVERNMENT (SECTIONS 8 TO 18).

§ 8. The Executive Government of the Union is vested in the King or his representative.

§§ 9–11. A Governor-General appointed by the King represents His Majesty in the Union, and exercises, subject to this Act, such powers and functions as His Majesty is pleased to assign to him. The salary of the Governor-General is fixed at £10,000, payable out of the Consolidated Revenue Fund of the Union, and is not to be altered during his continuance in office. The provisions of the Act are to apply to any person appointed as deputy to the Governor-General during his temporary absence.

§§ 12–13. An Executive Council to be chosen and summoned by the Governor-General is to advise him in the government of the Union.

*§ 14. Ministers of State, not exceeding eleven in number, are to be appointed to administer such departments of State as are established by the Governor-General-in-Council. These officers are to be members of the Executive Council, and after the first general election of members of the House of Assembly, no Minister is to hold office for more than three months unless he becomes a member of either House of Parliament.

*§ 15. The appointment and removal of all officers of the public service is vested in the Governor-General-in-Council unless delegated to some other authority.

§ 16. All powers and functions vested in the Governor or other authority of a Colony at the date of the establishment of the Union are to be vested in the Governor-General, the Governor-General-in-Council, or in the authority exercising similar powers under the Union.

§ 17. The command-in-chief of the naval and military forces within the Union is vested in the Governor-General as the representative of the King.

§ 18. Save as in section 23 excepted, Pretoria is to be the seat of Government of the Union.

PART IV—PARLIAMENT (SECTIONS 19 TO 23).

§ 19. The legislative power of the Union is vested in the Parliament, consisting of the King, a Senate, and a House of Assembly.

§ 20. Times for holding the sessions of Parliament may be appointed by the Governor-General, who also prorogues Parliament and dissolves the Senate and the House of Assembly. The dissolution of the Senate may not take place within a period of ten years after the establishment of the Union, nor may it affect any senators nominated by the Governor-General-in-Council.

§ 21. Parliament is to be summoned to meet within six months of the establishment of the Union.

§ 22. A period of twelve months may not intervene between the last sitting of Parliament in one session and its first sitting in the next session.

§ 23. Cape Town is to be the seat of the Legislature of the Union.

SENATE (SECTIONS 24 TO 31).

*§ 24. For the ten years after the establishment of the Union eight Senators are to be nominated by the Governor-General-in-Council, one half of their number being selected mainly on the grounds of their thorough acquaintance with the reasonable wants and wishes of the coloured races in South Africa. Each original Province is to elect eight senators. The senators hold their seats for ten years.†

§ 25. Parliament may provide for the constitution of the Senate after the expiration of the ten years, and unless and until such provision has been made, the Senate is to consist of the nominated members together with eight senators for each Province elected in the prescribed manner and holding office for ten years unless the Senate be sooner dissolved.

§ 26. The qualifications of a senator are as follows:—

He must—

(*a*) be not less than thirty years of age;

(*b*) be qualified to be registered as a voter for the election of members of the House of Assembly in one of the provinces;

(*c*) have resided for five years within the limits of the Union as existing at the time when he is elected or nominated;

(*d*) be a British subject of European descent;

(*e*) in the case of an elected senator, be the registered owner of immovable property within the Union of the value of not less than £500 over and above any special mortgages thereon.

§§ 27–28. Provision is made for the election of the President of the Senate.

§ 29. Provision is made for the resignation of senators.

§ 30. The presence of at least twelve senators is necessary to constitute a meeting of the Senate for the exercise of its powers.

§ 31. All questions in the Senate are determined by a majority of votes, the President having the casting vote.

† Amended by Act No. 54 of 1926.

HOUSE OF ASSEMBLY (SECTIONS 32 TO 50).

§§ 32–33. The House of Assembly is composed of members chosen by the voters of the Union in electoral divisions. The numbers elected in the original Provinces at the first election were Cape of Good Hope, 51; Natal, 17; Transvaal, 36; and Orange Free State, 17. The number in any original Province may not be diminished until the total number of members of the House of Assembly reaches 150, or until a period of ten years has elapsed.

*§ 34. Provision is made for the increase, from time to time, of the number of members to be elected in each Province.

§ 35. Parliament may prescribe the qualifications necessary to entitle persons to vote. No voter registered in the Province of the Cape of Good Hope may be disqualified by reason of his race and colour only except by a Bill passed by a joint sitting of both Houses of Parliament.

§ 36. The qualifications of voters for the election of members of the House of Assembly are the same as existed in the several Colonies at the establishment of the Union. No member of His Majesty's regular forces on full pay is entitled to vote.

*§ 37. The laws in force in the Colonies at the establishment of the Union relating to elections apply to the election of members of the House of Assembly. All polls are to be taken on the same day throughout the Union.

§§ 38–40. Provision is made for the setting up of an Electoral Delimitation Commission, and their duties are defined.

§§ 41–43. A similar commission is to be appointed after each quinquennial census.

§ 44. The qualifications of a member of the House of Assembly are as follows :—

He must—

(*a*) be qualified to be registered as a voter for the election of members of the House of Assembly in one of the provinces;

(*b*) have resided for five years within the limits of the Union as existing at the time when he is elected;

(*c*) be a British subject of European descent.

§ 45. No House of Assembly is to continue for a period longer than five years from the first meeting thereof.

§§ 46–47. Provision is made for the election of a Speaker of the House and for a deputy to perform his duties during his absence.

§ 48. Provision is made for the resignation of members.

§ 49. The presence of at least 30 members is necessary to constitute a meeting of the House.

§ 50. All questions are determined by a majority of votes, the Speaker having the casting vote.

BOTH HOUSES OF PARLIAMENT (SECTIONS 51 TO 58).

§ 51. Every senator and every member of the House of Assembly is required to take an oath or affirmation of allegiance in a form prescribed.

§ 52. A member of one House of Parliament is incapable of sitting as a member of the other House. Every Minister of State has the right to sit and speak in both Houses but may vote only in the House of which he is a member.

*§§ 53–54. The disqualifications for sitting as a senator or member of the House of Assembly are enumerated.

§ 55. Provides a penalty for any person, not a member, who sits or votes in the Senate or House of Assembly.

*§ 56. Provision is made for an annual allowance of £400 to each senator and each member of the House of Assembly.†

*§§ 57–58. Provision is made for the powers, privileges, and immunities of both Houses and for the making of rules and orders.

POWERS OF PARLIAMENT (SECTIONS 59 TO 67).

§ 59. Parliament has full power to make laws for the peace, order, and good government of the Union.

§§ 60–62. Bills appropriating revenue or imposing taxation must originate in the House of Assembly. The Senate may not amend such Bills nor may it amend any Bills so as to increase any proposed charges or burden on the people. The appropriation of any part of the public revenue must be recommended by message from the Governor-General before it may be originated or passed as a vote, resolution, address, or bill.

§ 63. Provision is made for the joint sitting of the members of the Senate and the House of Assembly in the event of both Houses not agreeing to amendments of a Bill after other prescribed expedients have failed.

§ 64. The Governor-General may assent to, or withhold assent from a Bill in the King's name, or may reserve the Bill for the signification of the King's pleasure. Bills repealing

† Amended by Act No. 51 of 1926 to £700 per annum.

or amending this section or any of sections 32 to 50, and Bills abolishing provincial councils or abridging their powers, must be so reserved. The mode of dealing with such Bills is defined.

§ 65. The King may disallow any law within one year after it has been assented to by the Governor-General.

§ 66. A Bill reserved for the King's pleasure has no force until it has received the King's assent and the fact has been proclaimed within one year from its presentation to the Governor-General.

§ 67. Two copies of every law, one in English and one in Dutch (one to be signed by the Governor-General) are to be enrolled of record in the office of the Registrar of the Appellate Division of the Supreme Court of South Africa.

PART V—THE PROVINCES.

ADMINISTRATORS (SECTIONS 68 TO 69).

§§ 68–69. Provision is made for the appointment of an administrator in each Province, who holds office for a term of five years. The salaries of the administrators are fixed and provided by Parliament, and may not be reduced during their respective terms of office.

PROVINCIAL COUNCILS (SECTIONS 70 TO 77).

§ 70. In each Province there is a provincial council consisting of the same number of members as are elected in the Province for the House of Assembly; but in no case is the membership to be less than twenty-five.

§ 71. Provision is made for the election of members of the provincial council.

§ 72. A member of the provincial council ceases to be a member on being elected to either House of Parliament.

§ 73. Each provincial council continues for three years from the date of its first sitting.

§ 75. A Chairman is elected by the provincial council, and rules may be made for the conduct of its proceedings.

§ 76. Members receive allowances determined by the Governor-General-in-Council.

77. Provides for freedom of speech in the provincial councils.

EXECUTIVE COMMITTEES (SECTIONS 78 TO 84).

§ 78. An executive committee of four persons, not necessarily members of the council, together with the administrator as chairman, is elected by the provincial council at its first meeting after each general election.

§ 79. Members of the executive committee who are not members of the provincial council may take part in the proceedings of the council but may not vote.

§ 80. The administration of affairs on behalf of the provincial council is carried on by the executive committee, or, when there are not sufficient members to form a quorum by the administrator pending the election of members to fill the vacancies.

§ 81. All powers, authorities, and functions vested in the government of the Colonies at the establishment of the Union are vested in the executive committee so far as they relate to matters in respect of which the provincial council is competent to make ordinances.

§ 82. Questions arising in the executive committee are determined by a majority of votes, the administrator having the casting vote.

§ 83. Provides for the appointment of public officers by the executive committee.

§ 84. The administrator may, and, when required to do so, must act on behalf of the Governor-General-in-Council in regard to all matters in respect of which no powers are reserved or delegated to the provincial council.

POWERS OF PROVINCIAL COUNCILS (SECTIONS 85 TO 91).

*§ 85. The provincial council may make ordinances in relation to certain specified matters. (See section 6 of this chapter, page 104.)

§ 86. Any ordinance made by a provincial council has effect in and for the Province as long and as far only as it is not repugnant to any Act of Parliament.

§87. A provincial council may recommend to Parliament the passing of any law relating to any matter in respect of which it is not competent to make ordinances.

*§ 88. Provision is made for the passing by Parliament of legislation in regard to any matter which requires to be dealt with by a private Act on the recommendation of a Select Committee appointed by the provincial council of the Province to which the matter relates.

§ 89. Provides for the formation of a provincial revenue fund in each Province and for its appropriation by ordinance for the provincial administration generally or for particular purposes, on the recommendation of the Administrator.

§ 90. The Governor-General-in-Council may assent or withhold his assent to a proposed ordinance passed by the provincial council, or may reserve it for further consideration.

§ 91. An ordinance assented to by the Governor-General-in-Council and promulgated by the administrator has the force of law within the Province. Two copies, one English and one Dutch, of each provincial ordinance are to be enrolled of record in the office of the Registrar of the Appellate Division of the Supreme Court of South Africa.

MISCELLANEOUS (SECTIONS 92 TO 94).

§ 92. Provides for the appointment of an auditor of accounts in each Province.

§ 93. All powers, authorities, and functions exercised at the establishment of Union by divisional or municipal councils, or any other duly constituted local authority, are to remain in force until varied or withdrawn by Parliament or a provincial council.

§ 94. The seats of provincial government are Cape Town, Pietermaritzburg, Pretoria, and Bloemfontein.

PART VI—THE SUPREME COURT OF SOUTH AFRICA (SECTIONS 95 TO 116).

*§ 95. The Supreme Court of South Africa is to consist of a Chief Justice of South Africa, the ordinary judges of appeal, and the other judges of the several divisions of the Supreme Court of South Africa in the Provinces.

*§ 96. The Appellate Division of the Supreme Court of South Africa is to consist of the Chief Justice, two ordinary judges of appeal, and two additional judges of appeal assigned from any of the provincial or local divisions of the Supreme Court.

*§ 97. Provides for the appointment of other judges to act temporarily as Chief Justice, ordinary judge of appeal, or additional judge of appeal.

§ 98. The several supreme courts of the four Colonies at the establishment of Union are to become provincial divisions of the Supreme Court of South Africa, each presided over by a judge president. The court of the Eastern Districts of the Cape of Good Hope, the High Court of Griqualand, the High Court of Witwatersrand, and the several circuit courts, are to become local divisions of the Supreme Court. Provision is made for the jurisdiction of the provincial and local divisions.

§ 99. The judges of the supreme courts of the Colonies at the establishment of Union are to become judges of the Supreme Court of South Africa. The Chief Justices of the Colonies to become the Judges President of the provincial divisions, and to retain the title of Chief Justice of their respective Provinces.

*§ 100. Provides for the remuneration of the Chief Justice, ordinary judges of appeal and all other judges of the Supreme Court.

§ 101. Provides for the removal from office of the Chief Justice and other judges of the Supreme Court.

§ 102. The Governor-General-in-Council may postpone filling a vacancy in any division of the Supreme Court other than the Appellate Division should he consider the number of judges may be reduced. The reduction is to be determined by Parliament.

*§§ 103–105. Provision is made for appeals in civil and criminal cases.

§ 106. There is no appeal from the Supreme Court of South Africa to the King-in-Council, but the King-in-Council retains the right to grant special leave to lodge such an appeal.

*§ 107. Provides for the making of rules for the conduct of the proceedings of the Appellate Division.

§ 108. Provides for the framing of rules for the conduct of the proceedings of the several provincial and local divisions.

*§ 109. The Appellate Division sits at Bloemfontein, but may from time to time hold its sittings at other places within the Union.

§ 110. Provides for the number of judges of the Appellate Division to form a quorum on the hearing of appeals.

§ 111. The process of the Appellate Division is to run throughout the Union.

*§ 112. Provides for the issue of writs or other processes by the registrar of every provincial division of the Supreme Court, in the case of judgments or orders given by any other division.

*§ 113. Provides for the removal of any civil suit pending in one provincial or local division of the Supreme Court to another.

§ 114. Provides for the appointment of a registrar and other officers of the Appellate Division.

§ 115. Provides for the admission of advocates and attorneys to practise before the Supreme Court of South Africa and before the Appellate Division.

§ 116. Provision is made for all suits pending in any superior court of any of the Colonies at the establishment of the Union to stand removed to the corresponding division of the Supreme Court of South Africa.

PART VII—FINANCE AND RAILWAYS (SECTIONS 117 TO 133).

*§ 117. All revenues are vested in the Governor-General-in-Council. Provision is made for the formation of a Railway and Harbours Fund and a Consolidated Revenue Fund.

*§118. Provides for the appointment of a commission to inquire into the financial relations which should exist between the Union and the Provinces.

§ 119. The annual interest of the public debts of the Colonies and any sinking funds constituted by law at the establishment of the Union form a first charge on the Consolidated Revenue Fund.

*§ 120. Money is to be withdrawn from the Consolidated Revenue Fund and from the Railway and Harbour Fund only under appropriation made by law; but expenditure may be incurred from the funds until the expiration of two months after the first meeting of Parliament.

§ 121. All stocks, cash, bankers' balances, and securities for money belonging to each of the Colonies at the establishment of the Union are to be the property of the Union.

§ 122. All property and rights belonging to the several Colonies are vested in the Governor-General-in-Council subject to any encumbrances thereon.

§ 123. All rights to mines, minerals, and precious stones belonging to the Government of any of the Colonies are vested in the Governor-General-in-Council.

§ 124. The Union is to assume all debts and liabilities of the Colonies existing at its establishment under certain conditions.

§ 125. All ports, harbours, and railways are vested in the Governor-General-in-Council. No railways and harbours are to be constructed without the sanction of Parliament.

*§ 126. Provides for the control and management of the railways, ports, and harbours of the Union by a board consisting of not more than three commissioners and a minister of State as chairman.

§ 127. The railways, ports, and harbours are to be administered on business principles. The total earnings are not to be more than sufficient to meet the necessary outlay on working, etc., and the payment of interest due on capital.

*§ 128. Provides for the establishment out of railway and harbour revenue of a fund to be used for maintaining uniformity of rates notwithstanding fluctuations in traffic.

*§ 129. All balances standing to the credit of any fund established in any of the Colonies for railway or harbour purposes at the establishment of the Union are to be under sole control of the Board.

*§ 130. Every proposal for construction is to be considered by the Board. The Board is to frame an estimate of the annual loss which in its opinion will result from construction carried out contrary to its advice. The amount of such estimate, when approved by the Controller and Auditor General, is to be paid annually to the Railway and Harbour Fund from the Consolidated Revenue Fund. If in any year the actual loss incurred is less than the estimate, the amount paid over is to be reduced accordingly.

§ 131. Provides for compensation for any loss incurred by the Board for provision of services gratuitously or at an insufficient rate of charge.

*§ 132. Provides for the appointment of a Controller and Auditor General by the Governor-General-in-Council, the office to be held during good behaviour.

§ 133. Provides for the compensation of Pietermaritzburg and Bloemfontein for any loss sustained by their ceasing to be seats of government; and of the municipal councils of Cape Town and Pretoria for similar losses, if any.

PART VIII—GENERAL (SECTIONS 134 TO 148).

§ 134. Provides for the election of senators and of members of the executive committees of the provincial councils according to the principle of proportional representation.

§ 135. All laws in force in the several Colonies at the establishment of the Union are to continue in force until repealed or amended by Parliament or the provincial councils. All legal commissions to continue as if the Union had not been established.

§ 136. Provision is made for free trade throughout the Union.

*§ 137. Both English and Dutch are the official languages of the Union.

§ 138. Persons naturalized in any of the Colonies are deemed to be naturalized throughout the Union.

*§ 139. Provides for the control of the administration of justice throughout the Union.

§ 140. All officers of the public service of the Colonies are to be become officers of the Union.

§ 141. Provides for the establishment of a public service commission to make recommendations for the reorganization and readjustment of the departments of the public service. The provisions of this section are not to apply to any service or department under the control of the Railway and Harbour Board.

*§ 142. Provides for the appointment of a permanent public service commission with powers relating to the appointment, discipline, retirement, and superannuation of public officers.

§ 143. Provides for pensions or compensation for officers of the public service of the Colonies not retained in the service of the Union.

§ 144. Any officer of the public service of any of the Colonies who is retained in the service of the Union is to retain all his existing and accruing rights and pension privileges.

§ 145. The services of officers in the public service of any of the Colonies are not to be dispensed with by reason of their want of knowledge of either the English or Dutch language.

§ 146. Provides for pension or compensation for any permanent officer of the Legislature of any of the Colonies who is not retained.

§ 147. The control and administration of native affairs and matters specially affecting Asiatics is to vest in the Governor-General-in-Council.

§ 148. All rights and obligations under any convention or agreements which are binding on any of the Colonies are to devolve upon the Union. The provisions of the railway agreement between the Governments of the Transvaal, the Cape of Good Hope and Natal are to be given effect to by the Government of the Union.

PART IX—NEW PROVINCES AND TERRITORIES (SECTIONS 149 TO 151).

§ 149. Provision is made for the alteration of boundaries and the formation of new provinces.

§§ 150–151. Provide for the admission into the Union of territories administered by the British South Africa Company, and territories belonging to or under the protection of His Majesty, inhabited wholly or in part by natives, upon the terms embodied in the schedule to the Act.

PART X—AMENDMENT OF THE ACT (SECTION 152).

§152. Provides for the amendment of the Act and the procedure to be followed in the repeal or alteration of §§ 33, 34, 35, and 137.

*§ 153. The Act is to be known as the "South Africa Act, 1909."

SCHEDULE.

§ 1. The Governor-General-in-Council is the legislative authority for any territory transferred to the Union.

§ 2. The Prime Minister is charged with the administration of any territory transferred, and is advised by a commission of not less than three members.

§ 3. Provides for the appointment of the members of the commission.

§ 4. Defines the duty of the members of the commission.

§ 5. Provides that a member dissenting from the decision of the majority may have the reasons for his dissent recorded.

§ 6. The members of the commission have access to all official papers concerning the territories.

§ 7. The Prime Minister may not make any decision relating to the administration or legislation for the territories without obtaining the opinion of the commission.

§ 8. Provides for the dispatch by the Prime Minister of urgent communications or orders without obtaining the opinion of the commission.

§ 9. Provides the method of procedure in the event of the views of the Prime Minister not agreeing with the recommendations of the commission.

§ 10. Provides the method of procedure in the event of a decision made or action taken by the Governor-General-in-Council contrary to the recommendations of the commission.

§ 11. Provides for the appointment of a resident commissioner for each territory.

§ 12. All duties of customs levied in the territories are to be paid into the Treasury of the Union. Provision is made for the annual payment out of the Treasury of a sum towards the cost of administration of each territory.

§ 13. Provision is made for supplementing any deficiency in revenue of one territory from the surplus funds of another territory or from the Union Government.

§ 14. Prohibits the alienation of land from the native tribes inhabiting reserves in Basutoland, Bechuanaland Protectorate, and Swaziland.

§ 15. The sale of intoxicating liquor to natives is prohibited in the territories.

§ 16. The custom, where it exists, of holding pitsos or other recognized forms of native assembly is to be maintained in the territories.

§ 17. No differential duties or imposts on the produce of the territories are to be levied. The laws of the Union relating to customs and excise are to apply to the territories.

§ 18. The inhabitants of the territories are to have free intercourse with the rest of South Africa subject to the laws of the Union.

§ 19. Revenues derived from any territory are to be expended on behalf of that territory. Provision may be made for the appropriation of a portion of the revenue as a contribution towards the cost of defence and other services performed by the Union for the whole of South Africa.

§ 20. The King may disallow any law made by the Governor-General-in-Council by proclamation for any territory within one year of the date of proclamation.

§ 21. Provides for salaries, pensions, and expenses of the members of the commission.

§ 22. The rights as existing at the date of transfer of officers of the public service employed in any territory are to remain in force.

§ 23. Appeal is to be made to the Appellate Division of the Supreme Court of South Africa.

§ 24. Provides for the preparation by the commission of an annual report on the territories.

§ 25. All Bills to amend or alter the provisions of this Schedule are to be reserved for the signification of His Majesty's pleasure.

SOUTH AFRICA ACT, 1909—SCHEDULE OF AMENDING, MODIFYING, OR DEFINITIVE LEGISLATION TO 1925.

	§ 13, Act No. 27 of 1912..	As to the abolition of the office of the Crown Prosecutor of Griqualand West.
142. Public Service Commission..	§ 2, Act No. 29 of 1912 as amended by § 3, Act No. 39 of 1914	Appointment, powers, and duties of the Commission.
142. Public Service Commission..	§§2, 3, 4, 5, 6, 7, and 8 of Act No. 27 of 1923	Appointment, powers, and duties of the Commission.

§ 3. Central Administration.

1. **General.**—Under the *South Africa Act*, the supreme executive authority in the Union is vested in the King, and may be administered by him in person, or by the Governor-General as his representative. There is an Executive Council to advise the Governor-General. The term Governor-General-in-Council is understood as the Governor-General acting with the advice of the Executive Council, the members of which are chosen by him and hold office during his pleasure. These in practice are the Ministers charged with the administration of the Departments of State (who may not exceed eleven in number). They are appointed by the Governor-General; but the mode of the selection of Ministers and the formation of a Ministry conforms with the practice under the British Constitution, as does also the method of Government by a Cabinet possessing the confidence of a majority in Parliament.

2. **The Governor-General.**—The Governor-General (section 9 of the *South Africa Act*), is appointed by and represents the King, and is also Commander-in-Chief of the naval and military forces within the Union. The salary, to be paid out of the Consolidated Revenue Fund of the Union, is fixed (section 10 of the *South Africa Act*) at £10,000 annually.

Letters Patent constituting the Office of Governor-General and Commander-in-Chief and Royal Instructions were issued on the 29th December, 1909, and were given in full in the first four issues of this Year Book.*

3. Ministries of the Union.—The first Ministry of the Union, which assumed office on the 31st May, 1910, upon the establishment of the Union, was constituted as follows :—

FIRST MINISTRY OF THE UNION. [31.5.10 to 19.12.12.]

Department.	Minister.	Department.	Minister.
Prime Minister and Agriculture	General the Right Hon. Louis Botha, P.C.	Finance	Hon. H. C. Hull.
Railways and Harbours	Hon. J. W. Sauer.	Lands	Right Hon. A. Fischer, P.C.
Interior, Mines, and Defence	General the Hon. J. C. Smuts, K.C.	Native Affairs	Hon. H. Burton, K.C.
Justice	General the Hon. J. B. M. Hertzog.	Commerce and Industries	Right Hon. Sir F. R. Moor P.C., K.C.M.G.
Education	Hon. F. S. Malan.	Public Works and Posts and Telegraphs	Hon. Sir David P. de Villiers Graaff, Bart.
		Without Portfolio	Senator the Hon. Dr. C. O'Grady Gubbins.

The second Ministry of the Union also was formed by General the Right Hon. Louis Botha, P.C., on the 20th December, 1912.

On the death of General Botha, the third Ministry of the Union was constituted (3rd September, 1919) by General the Right Hon. J. C. Smuts, P.C., C.H., K.C. The personnel of these two Ministries, as well as the changes introduced by General Smuts on the 19th March 1920, and the 10th March, 1921, were given in *Official Year Book* No. 6 and previous issues. The fourth Ministry of the Union, constituted on the 30th June, 1924, was as follows :—

FOURTH MINISTRY OF THE UNION (CONSTITUTED ON 30th JUNE, 1924).

Department.	Minister.	Department.	Minister.
Prime Minister and Native Affairs	General the Hon. J. B. M. Hertzog.	Mines and Industries	Hon. F. W. Beyers, K.C.
Justice	Hon. T. J. Roos, K.C.	Railways and Harbours	Hon. C. W. Malan.
Interior, Public Health, and Education	Hon. Dr. D. F. Malan.	Lands	Hon. P. G. W. Grobler.
Defence	Colonel the Hon. F. H. P. Creswell.	Agriculture	General the Hon. J. C. G. Kemp.
Finance	Hon. N. C. Havenga.	Posts and Telegraphs and Public Works	Hon. T. Boydell.

On the 12th November, 1925, Mr. W. B. Madeley assumed the Portfolios of Posts and Telegraphs and Public Works, while Mr. Boydell took up the Portfolio of Labour, which had hitherto been held by Col. Creswell, conjointly with that of Defence.

4. Departments of State and Ministers.—The subjoined table gives each Department of State which has been constituted from 1910, with the names of each Minister of such Department and the date of assumption of office. The number of Ministers in charge of Departments of State must not exceed eleven (section 14 of the *South Africa Act* as amended) :—

DEPARTMENTS OF STATE IN THE UNION AND MINISTERS FROM 31st MAY, 1910.

Department and Minister.	Date of Assumption of Office.	Department and Minister.	Date of Assumption of Office.
Prime Minister—		†*Commerce and Industries*—

Inspection of areas of local authorities, water supplies, drainage schemes, etc. Medical services, Defence, including military hospitals. Leprosy and leper institutions. Medical boards. Medical advice and assistance to other Government Departments, the Public Service Commission, and Provincial Administrations.
PUBLIC WORKS. District Engineers— (*a*) Bloemfontein. (*b*) Cape Town. (*c*) Johannesburg. (*d*) Ladysmith, Natal. (*e*) Pietermaritzburg. (*f*) Port Elizabeth. (*g*) Potchefstroom. (*h*) Pretoria. Electrical Engineer.	—	Design, erection, and maintenance of (*a*) public buildings for Union and provincial purposes (exclusive of school buildings in the Cape Province) and (*b*) provincial and inter-provincial bridges. Provision of accommodation and services in connection therewith (including the hiring of all property required) for Union Government purposes. Lettings of Government buildings. Provision and maintenance of mechanical and electrical equipment. Miscellaneous agency and consulting services for Provincial Administrations and university authorities.

6. **The Public Service.**—The organization and discipline of the Public Service of the Union is provided for by the *Public Service and Pensions Act*, No. 27 of 1923. By this the Public Service is classed in five divisions :—

(i) *The Administrative Division.*—This consists of the secretaries and under-secretaries of the several departments of state ; the chief clerks, principal clerks, senior clerks, provincial secretaries, provincial auditors of accounts and magistrates ; and all other persons whose offices or posts are directed by the Governor-General from time to time to be included in the Administrative Division.

(ii) *The Clerical Division.*—This includes all persons whose offices or posts are directed by the Governor-General to be included in the Clerical Division.

(iii) *The Professional Division.*—This division consists of a higher and a lower branch, and includes all persons whose offices or posts are directed by the Governor-General to be included in the division, and such persons shall be in the higher or lower branch, as may be directed by the Governor-General.

(iv) *The General Division.*—This includes all persons whose offices or posts the Governor-General directs to be included in the General Division.

(v) *The Services.*—These include the permanent Defence Force, the Police Force and subordinate officers of the Prisons Department.

The following are not included in the Public Service :—

Ministers ; the Administrator of a Province or of a mandated territory ; the High Commissioner for the Union in the United Kingdom ; the Chief Justice of South Africa or any Judge of the Supreme Court, a private secretary to a Minister, a clerk to the Chief Justice or to a Judge of the Supreme Court and an itinerant water-court judge if, at the date of appointment as such private secretary, clerk, or water-court judge, he was not an officer of the Public Service ; officers of Parliament ; the personal staff of His Excellency the Governor-General ; any member of the Commission ; any person employed in the Railway Administration ; any person employed by the Government or by any Provincial Administration or by the administration of the mandated territory, whose whole time is not at the disposal thereof or any person remunerated by fees only ; any person so employed if by the terms of his appointment made in accordance with law he is not subject to the laws regulating the Public Service ; any teacher serving under any Provincial Administration or under the administration of the mandated territory, persons temporarily employed under section 16 of the Act, or any person in the employment of the Government of the Union or of the Administration of the provinces or of the mandated territory, not being a member of the services, whose post is not included by the Act or by direction of the Governor-General in the administrative or clerical or professional or general division.

Regulations in connection with the classification of posts undertaken in terms of the new Act were contained in Government Notices issued in September, 1923. Revised scales of salaries, wages, and allowances under the Act were published in October, 1923. The following are the scales of pay fixed for certain posts in the administrative, clerical, and professional divisions which are common to all or several departments :—

7. Public Service Commission.—Section 142 of the *South Africa Act* required the appointment of a permanent Public Service Commission. Section 2 of the *Public Service and Pensions Act*, No. 27 of 1923, made provision in conformity with such requirement. The Commission appointed consists of three members.

8. **Powers and Duties of Public Service Commission.**—The Commission has certain powers conferred and duties imposed upon it by the Act, relating to the appointment, promotion, discipline, retirement, and superannuation of persons employed in the Public Service, and is required *inter alia* :—

(i) To make recommendations as to appointments and promotions.

(ii) To keep a record of persons employed in the Administrative, Clerical, and Professional divisions and in prescribed posts in the general division.

(iii) To make recommendations as to the grading and classification or regrading and conversion of posts in the administrative, clerical, professional, and general divisions.

(iv) To make recommendations as to the control, reorganization and readjustment of any departments or offices in the Public Service and, further, to make recommendations as to the retirement from the Public Service of any persons in consequence of any such reorganization or readjustment.

(v) To make recommendations as to the retirement of officers in the administrative, clerical, and professional divisions and in prescribed posts in the general division on the ground of superannuation, continued ill-health, or inefficiency.

(vi) To make recommendations for effecting economies and promoting efficiency in the management and working of departments, sub-departments, and other offices of the Public Service.

(vii) To inquire into the grievances of officers.

(viii) To make recommendations as to the provisions of the regulations to be made under the Act.

(ix) To frame for the information of Parliament an annual report and such special reports as the Commission considers desirable.

(x) To inquire into and recommend action in cases of imputed misconduct of a serious character.

(xi) To exercise such other powers and jurisdiction and perform such other duties not repugnant to the Act as may be assigned to it by the Governor-General.

Under the Public Service Regulations the administration of the following regulations is vested in the Public Service Commission :—

(i) Subsistence and Transport Allowances Regulations.

(ii) Leave Regulations (by authority delegated to the Commission by the Minister of Finance).

(iii) Regulations governing payment of extra remuneration and payment in respect of overtime.

In terms of the Financial Regulations, framed under section 61 of the *Exchequer and Audit Act*, 1911, the authority of the Commission is required for the expenditure involved in—

(i) the appointment of permanent and temporary officials, except when the appointment is to certain specified posts in the lower grades ;

(ii) the creation of any new post not provided for in the estimates of expenditure approved by Parliament ;

(iii) the alteration of the scale of salary attached to any existing appointment by raising the minimum or maximum of the scale or the rate of annual increment ;

(iv) the payment of any gratuity or extra remuneration to any public servant, except when the payment is specifically provided for by regulation.

9. **Public Service Commission of Inquiry.**—A special Commission to inquire into the organization of the Public Service was appointed on the 12th June, 1918, of which the Hon. T. L. Graham. Judge President of the Eastern Districts Court, was chairman. The Commission sat until November, 1920, and presented altogether five reports.

A summary of these reports, together with the recommendations as to salary (Fifth Report), appeared in previous issues of this *Year Book* (Nos. 5 and 6).

10. **Public Service Advisory Council.**—In terms of Act No. 27 of 1923, regulations in connection with a Public Service Advisory Council were issued under Government Notice No. 1513 of 5th September, 1923. The Council consists of not more than eight members nominated annually by the various Public Service Associations from amongst their members and acts in an advisory capacity to the Public Service Commission, when so requested by that body. Its functions include advising upon the following matters :—

(i) The best means of utilizing the ideas and experience of the staff.

(ii) The general principles governing conditions of service, recruitment, hours, promotion, advancement, discipline, tenure, remuneration, and superannuation.

(iii) The means for encouraging the further training and education of public servants, also their training in higher administration and organization.

(iv) The introduction of improvements in office machinery and organization, and the provision of opportunities for the full consideration of suggestions by the staff on this subject.

(v) Legislation so far as it has a bearing upon the position of public servants in relation to their employment.

(vi) Any matter referred to it by the Commission.

In addition, rules were prescribed for the recognition of associations and for the government and the conduct of the business of the Council.

The first Public Service Advisory Council was established in December, 1923.

11. **Strength of Staff in Government Service.**—The following tables give particulars of the permanent and temporary staff employed in the various Departments of the Union Public Service for a period of years. Particulars of the staffs of the various Provincial Administrations will be found below in § 5 of this chapter, and of the staff of the Railways and Harbours Administration in Chapter XX.

The authorized European establishment of the Union Public Service, as shown in the Estimates presented each year to Parliament, was:—1912–13, 20,859; 1913–14, 21,412; 1914–15, 22,739; 1915–16, 19,700; 1916–17, 20,878; 1917–18, 20,796; 1918–19, 20,832; 1919–20, 25,005 (including 3,695 in respect of Defence Department, for which no figures had been given since 1914–15); 1920–21, 28,234 (including uniformed staff and Post Office learners); 1921–22, 28,772; 1922–23, 27,149; 1923–24, 26,392; 1924–25, 26,637; 1925–26, 27,071.

§ 4. Parliament and Legislation.

[For list of Members, see Chapter XXVIII.]

1. **Parliament.**—The legislative power of the Union is vested in terms of section 19 of the *South Africa Act* (see § 1 of this Chapter) in the King, represented by the Governor-General, a Senate, and a House of Assembly. Sessions of Parliament (section 20 of the *South Africa Act*) may be appointed by the Governor-General, who may also prorogue Parliament, or may dissolve the Senate * and House of Assembly simultaneously, or the House of Assembly alone. No dissolution of the Senate (see paragraph 3 below) can affect those Senators who have been nominated by the Governor-General-in-Council.† Cape Town is constituted as the seat of the Legislature (section 23 of the *South Africa Act*). The powers of Parliament are described in sections 59 to 67 of the Act. Parliament has full powers to make laws for the peace, order, and good government of the Union.

2. **Sessions of Parliament.**—A Session of Parliament must be held once at least in every year, so that a period of twelve months shall not intervene between the last sitting of Parliament in one session and its first sitting in the next session. The first Parliament was opened by His Royal Highness the Duke of Connaught and Strathearn on the 4th November, 1910. The following table gives a list of sessions from 1910 to 1924 with the dates of commencement and ending in each case and the duration of each session (Sundays and public holidays included):—

* Under the *South Africa Act* the original Senate held office to 31st May, 1920, and under Act No. 9 of 1920 until 31st October, 1920.

† Act No. 54 of 1926 provides for the retirement of those Senators when the Senate is dissolved, or upon a change of Government.

SESSIONS OF PARLIAMENT.

Number of Parliament and of each Session.	Year.	Commencement and Ending.	Duration (in Days).
First Parliament—			
1st Session	1910–11	31.10.10—25. 4.11	177

Session	1920	19. 3.20—17. 8.20	152
[*Senate expired by effluxion of time on 31st October, 1920, under Sections 24 and 25 of the South Africa Act, 1909, and Sections 1 and 2 of the Constitution of the Senate Act, 1920.*			
House of Assembly dissolved by Proclamation No. 225 of 1920, dated 31st December, 1920.]			
Fourth Parliament—			
1st Session	1921	11. 3.21—14. 7.21	126
2nd Session	1922	17. 2.22—19. 7.22	153
3rd Session	1923	19. 1.23—23. 6.23	156
4th Session	1924	25. 1.24—10. 4.24	77
[*House of Assembly dissolved by Proclamation No. 88 of 1924, dated 9th May, 1924.*]			
Fifth Parliament—			
1st Session	1924	25. 7.24— 6. 9.24	44
2nd Session	1925	13. 2.25—25. 7.25	163
Joint Sitting of Both Houses	1925	6. 5.25— 8. 5.25	3
3rd Session	1926	22. 1.26— 8. 6.26	138
Joint Sitting of Both Houses	1926	7. 5.26—12. 5.26	6

3. ***The Senate.**—The second Senate of the Union is composed of eight Senators nominated by the Governor-General-in-Council, four of whom are selected on the ground mainly of their thorough acquaintance, by reason of their official experience or otherwise, with the reasonable wants and wishes of the coloured races, and eight Senators elected by each of the four Provinces of the Union.

The second Senate first met on 11th March, 1921, and unless sooner dissolved, which can happen at any time, provided it is simultaneous with a dissolution of the House of Assembly, is constituted for ten years. The Provincial representatives are elected, according to the system of proportional representation with the single transferable vote, by the Members of the House of Assembly and of the Provincial Council for each Province sitting together and presided over by the Administrator of such Province. Vacancies amongst elected Senators are filled in the same manner, but only for the period which the Senator in whose place the new Senator is elected, would have held his seat; whereas nominated Senators always sit for the full ten-year period, which is not even affected by the dissolution of the Senate or its expiration by the effluxion of time. In addition to having the qualifications required by Members of the House of Assembly, all Senators must be not less than thirty years of age, and, in the case of elected Senators, must own unencumbered, immovable property within the Union of not less value than £500. The Legislative powers of the Senate are co-ordinate with those of the House of Assembly except in regard to the origination and amendment of certain monetary provisions in Bills.

4. **The House of Assembly.**—The House of Assembly is composed of members directly chosen by the voters of the Union in electoral divisions as laid down by the *South Africa Act*. Matters relating to the delimitation of such divisions, the qualifications of voters, and the election of members are dealt with in § 8 of this Chapter. The number of members which was fixed for the first election is given below. The method of the increase of the number of members is dealt with in section 34 of the *South Africa Act*. As the result of the operation of this section, on the issue of the returns for the Census of Population taken in 1911, 1918, and 1921, the number of members in the Transvaal was increased on each occasion.

* See Act No. 54 of 1926, which provides for the dissolution of the Senate and the retirement of nominated Senators.

of members which was fixed for the first election is given below. The method of the increase of the numbers of members is dealt with in section 34 of the *South Africa Act.* As the result of the operation of this section, on the issue of the returns for the Census of Population taken in 1911, 1918, and 1921, the number of members in the Transvaal was increased on each occasion.

The original and the later constitutions of the House are given hereunder :—

Province.	Number of Members in			
	1910–15 (First Parliament).	1915–19 (Second Parliament).	1920–24 (Third and Fourth Parliaments).	1924 (Fifth Parliament).
Cape of Good Hope	51	51	51	51
Natal	17	17	17	17
Transvaal	36	45	49	50
Orange Free State	17	17	17	17
TOTAL	121	130	134	135

The qualifications of a member of the House of Assembly are defined in section 44 of the *South Africa Act.* Every House of Assembly has a duration of five years (but not longer) from the date of its first meeting, unless sooner dissolved by the Governor-General. The first business of the House is the election of one of its members as Speaker, who ceases to be Speaker if he ceases to be a member of the House. A member may resign his seat. The presence of thirty members is necessary to constitute a *quorum.* Each member receives an allowance of £400 * a year, except the Speaker and Ministers receiving salary under the Crown.

5. **Acts of Parliament.**—A synopsis is given hereunder of the various enactments of the Parliament of the Union in the second Session 1924 and the Session of 1925, excluding Appropriation Acts. Similar information in respect of Acts passed during the years 1910 to 1924 (first Session) will be found in previous issues of this *Year Book.*

SYNOPSIS OF ACTS OF PARLIAMENT, SECOND SESSION 1924 AND SESSION 1925.

Year in which Act was passed; Number and Title.	Date of Commencement.	Object and Effect.
1924.		
26. Income Tax	3/9/24	To fix the rates of normal income tax and super tax in respect of the twelve months ended the thirtieth day of June, 1924.
27. Customs and Excise Duties Amendment	6/9/24	To amend further the tariffs of customs and excise in force in the Union, and to amend in other respects the laws relating to customs and excise; and for other matters incidental thereto.
28. Maroka Ward Land Relief	1/3/25	To enable members of the Baralong Tribe to acquire and hold land and interests in land in the Maroka Ward, now known as the district of Thaba 'Nchu in the Province of the Orange Free State.
29. Rents Acts Extension	15/9/24	To extend with retrospective effect the period for which Act No. 13 of 1920, which constituted boards to control, fix, and reduce rents charged for dwellings and for other purposes incidental thereto, together with the Acts extending and amending that Act, shall be in operation.

* This amount was increased to £700 a year by Act No. 51 of 1926.

SYNOPSIS OF ACTS OF PARLIAMENT, SECOND SESSION 1924 AND SESSION 1925—*continued.*

Year in which Act was passed; Number and Title.	Date of Commencement.	Object and Effect.
1924—(*contd.*).		
30. South-West Africa—Naturalization of Aliens	15/9/24	To provide for the naturalization of aliens in the mandated territory of South West Africa and other matters incidental thereto.
31. Zululand Railway Construction	15/9/24	To provide for the construction and equipment of a line of railway from Matubatuba to the south bank of the Pongola River in Zululand; and for the purposes thereof to confer upon the Governor-General certain powers incidental thereto.
32. Land Banks Acts, Further Amendment	10/9/24	To amend further the laws relating to the Land and Agricultural Bank of South Africa.
33. Board of Trade and Industries	10/9/24	To provide for the establishment of a Board of Trade and Industries in lieu of the Board mentioned in Act No. 28 of 1923, and to define its functions and duties, and to amend Act No. 28 of 1923.
34. Electricity Act Amendment	10/9/24	To amend section 6 of the Electricity Act, 1922 (Act No. 42 of 1922).
35. Miners' Phthisis Act Amendment	1/8/24	To amend the Miners' Phthisis Act, 1919 (Act No. 40 of 1919), and to make special provision in the case of miners who volunteered for active service and who failed to obtain benefits in respect of a disablement either under the War Special Pensions Act, 1919 (Act No. 42 of 1919), or the Miners' Phthisis Act, 1919 (Act No. 40 of 1919).
36. Financial Adjustments	10/9/24	To make special provision for certain financial matters and in respect of matters involving charges upon, or expenditure of, public revenues of the Union, and to amend or interpret certain statutes relating to pensions.
37. Pensions (Supplementary)	10/9/24	To provide for certain pensions, grants, gratuities, and other pensionable benefits.
38. Land Settlement Acts, Further Amendment	10/9/24	To amend further the laws relating to land settlement.
1925.		
5. Housing Act, 1920, Amendment	2/5/25	To amend definition of dwelling in section 1 of Act No. 35 of 1920.
6. Wild Birds Export Prohibition	2/5/25	To prohibit the exportation of wild birds.

SYNOPSIS OF ACTS OF PARLIAMENT, SECOND SESSION 1924 AND SESSION 1925—*continued.*

Year in which Act was passed; Number and Title.	Date of Commencement.	Object and Effect.
1925—(*contd.*).		
7. Union and Rhodesia Customs Agreement	2/5/25	To provide for the ratification of the Customs Agreement entered into between the Government of the Union of South Africa and the Governments of Southern and Northern Rhodesia respectively, and to authorize the Governor-General to issue a proclamation and regulations for giving effect to that agreement, and generally to provide for other matters incidental thereto.
8. Official Languages of the Union	31/5/10	To recognize Afrikaans as one of the official languages of the Union.
9. South Africa Act, 1909, Amendment	27/5/25	To acknowledge the sovereignty and guidance of Almighty God.
10. South African Museum Act, 1857 (Cape), Amendment.	27/5/25	To amend Act No. 17 of 1857 (Cape).
11. South African Association Incorporation Act, 1906 (Cape), Amendment (Private)	27/5/25	To amend the South African Association Incorporation Act, 1906 (Cape).
12. Fruit Export Control	27/5/25	To provide for the control of the export of fruit from the Union and of the shipment of fruit at Union ports.
13. Orchard Cleansing...	27/5/25	To provide for the cleansing of orchards in respect of insect pests and plant diseases.
14. Ebenezer (Van Rhynsdorp) Exchange of Land	11/6/26	To provide for the exchange of certain lands in the Division of Van Rhynsdorp, Province of the Cape of Good Hope, and matters incidental thereto.
15. Sundays River Settlements Administration	16/7/25	To declare certain non-riparian land in the Division of Uitenhage to be riparian to the Sundays River and certain land riparian to the Sundays River to be non-riparian, and to alter the boundaries of the Sundays River Irrigation District, and further to grant such powers as are necessary for the carrying out of the obligations assumed by the Government on the purchase of the assets of the Cape Sundays River Settlements, Limited, and for the administration of the said assets.
16. Agricultural Industries Advancement	16/7/25	To make provision for levies on particular agricultural products in certain circumstances for the promotion of agriculture; for the creation of special accounts into which those levies shall be paid; for the application of moneys paid into such accounts; for the protection of standards prescribed for agricultural products; and to amend further the Agricultural Produce Export Act, 1917, and for other purposes incident to inspection and grading of such products.

SYNOPSIS OF ACTS OF PARLIAMENT, SECOND SESSION 1924 AND SESSION 1925—*continued.*

Year in which Act was passed; Number and Title.	Date of Commencement.	Object and Effect.
1925—(*contd.*).		
17. City of Cape Town (Muizenburg Beach), Improvement	16/7/25	To vest certain lands adjoining False Bay in the Council of the City of Cape Town.
18. Diseases of Stock, 1911, Further Amendment	16/7/25	To amend the Diseases of Stock Act, 1911, and to validate certain orders issued under section 16 thereof.
21. Settlements (Committee of Management)	27/7/25	To provide for the establishment of committees of management settlements laid out on Crown land and matters incidental thereto.
22. Public Auctions and Transactions in live stock and produce	27/7/25	To regulate certain transactions in, and the sale by auction of, live stock and agricultural produce.
23. Railways and Harbours Service	1/9/25	To consolidate and amend the laws relating to the organization of, and discipline and conditions of, employment in the Department of Railways and Harbours of the Union.
24. Railways and Harbours Superannuation Fund	1/9/25	To make further provision as to retiring pensions or other financial benefits payable to servants in the Department of Railways and Harbours of the Union and to amend certain laws relating thereto.
25. Government Attorney	21/8/25	To provide for the establishment of the office of Government Attorney for the Union and for other matters incidental thereto.
26. Land Settlement Laws Further Amendment	30/7/25	To amend the laws relating to Land Settlement.
27. Wage.....	12/2/26	To provide for the determination of conditions of labour and of wages and other payments for labour, the appointment of a wage board, and investigations as to wages and conditions of labour.
28. Native Lands (Natal and Transvaal) Release	30/7/25	To empower the Government and certain native trusts to give effect to certain transactions.
31. Death Duties Act, 1922, Amendment	1/7/25	To amend the Death Duties Act, 1922.
32. Licences Consolidation	1/1/26	To provide for the licensing of trades, professions, and occupations within the Union, and to fix the licence duties payable.
33. Railways Construction	5/8/25	To provide for the construction and equipment of certain lines of railway for the validation of certain acts done, works performed, and rights acquired; for power to close a certain portion of a line of railway; and certain matters incidental thereto.

SYNOPSIS OF ACTS OF PARLIAMENT, SECOND SESSION 1924 AND SESSION 1925—*continued.*

Year in which Act was passed; Number and Title.	Date of Commencement.	Object and Effect.
1925—(*contd.*).		
34. South Africa Act, 1909, Further Amendment	5/8/25	To provide for the appointment of an eleventh Minister.
35. Miners' Phthisis Acts, Consolidation	1/8/25	To consolidate and amend the laws relating to miners phthisis.
36. Customs Tariff and Excise Duties Amendment	30/7/25	To provide for the imposition of duties of customs upon goods imported into the Union; to amend the tariff of excise in force in the Union; to validate the action of the Government in suspending the collection of certain customs and excise duties; to amend the laws relating to customs; and for other matters incidental thereto.
37. New Cape Central Railway Acquisition	5/8/25	To confirm a certain agreement between the Railways and Harbours Administration of the Union and the New Cape Central Railway Company, Limited, and to provide for other matters incidental thereto.
38. Co-operative Societies Act, 1922, Amendment	30/7/25	To amend the Co-operative Societies Act, 1922 (Act No. 28 of 1922).
39. Diamond Control....	29/8/25	To provide for the control of the sale and export of diamonds, and for the establishment of a diamond control board in the Union.
40. Income Tax.....	29/6/25	To provide for the taxations of incomes and to consolidate and amend the law relating thereto.
41. Natives Taxation and Development	1/1/26	To consolidate and amend the law relating to the taxation of natives and to provide additional funds for the development, education, and local government of natives.
42. South West Africa Constitution	5/8/25	To make provision for the constitution of an Executive Committee, an Advisory Council, and a Legislative Assembly for the mandated territory of South West Africa, to define the powers, authorities, and functions severally of that committee, council, and assembly; and to make other provisions in respect of the administration of, and legislation for, that territory.
43. Financial Adjustments	5/8/25	To make special provision for certain financial matters affecting the Consolidated Revenue Fund and the Railway and Harbour Fund; for the administration of certain educational institutions and funds; for the disposal of the surplus funds and the transfer of the assets, liabilities, powers, and duties of the Custodian of Enemy Property; to amend certain statutes relating to pensions and other matters; and to amend the law relating to the Land and Agricultural Bank of South Africa.

SYNOPSIS OF ACTS OF PARLIAMENT, SECOND SESSION 1924 AND SESSION 1925—*continued.*

Year in which Act was passed; Number and Title.	Date of Commencement.	Object and Effect.
1925—(*contd.*).		
44. Pensions Supplementary	5/8/25	To provide for certain pensions grants, gratuities, and other pensionable benefits, and to amend certain laws relating thereto.
45. Merchant Shipping (Certificates of Competency)	—	To make further provision for the granting of certificates of competency or service to persons employed as masters, mates, engineers, and in certain other capacities upon certain vessels; for the suspension and cancellation of such certificates; and for other matters incidental thereto.
46. Provincial Subsidies and Taxation Powers (Amendment)	1/4/25	To amend the laws regulating the financial relations between the Union and the several Provinces thereof; to modify the provisions of section *eighty-five* of the South Africa Act, 1909, in certain respects; and to declare the sources and matters from which the Provinces may raise revenue by way of taxation and the legislative powers of the Provincial Councils in respect thereof.

6. **Subjects of Legislation by Parliament.**—The subjoined table gives a synopsis of the enactments of the Union Parliament from its first session (1910), arranged according to the subject dealt with. Appropriation Acts and Acts which have been repealed or are of no further effect have been omitted.

§ 5. Provincial Administration.

1. **Administrators of the Provinces.**—The *South Africa Act* provides that in each of the four Provinces there shall be a chief executive officer appointed by the Governor-General-in-Council, and styled the Administrator of the Province. All executive acts relating to Provincial affairs are done in the name of this officer. In the appointment of an Administrator preference is, as far as possible, given to a person resident in the Province. Administrators are appointed for five years, and their salaries are provided by Parliament.

2. **Executive Committees of the Provinces.**—Each Provincial Council elects at its first meeting, from among its members, or otherwise, four persons to form with the Administrator an Executive Committee for the Province, the Administrator acting as chairman. A member of a Provincial Executive Committee who is not also a member of the Provincial Council is entitled to take part in the proceedings of the Council but has not the right to vote. The function of Executive Committees is to carry on the administration of Provincial affairs on behalf of the Provincial Council. Executive Committees have the power, subject to certain considerations, to appoint officers to the Provincial Services.

3. **Functions of Provincial Administrations.**—The functions of the Administrations of the several Provinces are concerned with the matters in respect of which Provincial Councils possess the power of legislation and with those matters the administration of which has been specially assigned to the Provinces. (*Cf.* paragraph 2 of § 6 of this Chapter.) The control of primary and secondary education comprises an important part of those functions, and references to this subject will be found in Chapter IV, which deals with Education. The establishment, maintenance, and management of hospitals and charitable institutions are controlled by the Provinces, and these phases of Provincial supervision are treated of in Chapter VII and Chapter VIII respectively. Similarly, the question of the

control of municipal institutions, divisional councils, and other local governing bodies of a similar nature, with which the Provinces are concerned, is referred to in Chapter III, which deals with Local Government. Roads, outspans, ponts, and bridges (other than bridges connecting two Provinces), moreover, come under Provincial control (for particulars of these, see Chapter XX). The preservation of game and fish is likewise under the control of the Provincial Administrations (see Chapters I and XV respectively).

The Provincial Administrations also deal, among other matters, with the destruction of vermin, the eradication of noxious weeds, and the regulation of shop hours and public entertainments.

4. **Staff in the Service of the Provincial Administrations.**—Particulars are given hereunder of the authorized establishments of the Provincial Administrations in respect of the financial year 1923–24, together with a statement of the temporary staff actually employed by them at 31st December, 1923 :—

NUMBER OF PERSONS IN THE SERVICE OF THE PROVINCIAL ADMINISTRATIONS, 1923–24.

Administration.	Permanent Staff Authorized, 1923–24.			Temporary Staff Employed, 31st December, 1923.			Grand Total.
	Male.	Female.	Total.	Male.	Female.	Total.	
Cape.....	344	101	445	104	18	122	567
Natal.....	117	20	137	10	3	13	150
Transvaal.....	209	64	273	15	7	22	295
Orange Free State.	97	15	112	7	6	13	125
TOTAL....	767	200	967	136	34	170	1,137

§ 6. Provincial Councils and Legislation.

1. **Provincial Councils.**—The Provincial Council of each Province consists of the same number of elected members (sections 70–7 of the *South Africa Act*) as there are electoral divisions of the House of Assembly, unless that number is under twenty-five as is the case in Natal and the Orange Free State, when the number of members of the Provincial Council is fixed at twenty-five. Each Council has a duration of three years and is subject to dissolution only by effluxion of time. The times for sessions and their prorogation are fixed by the Administrator. There must be a session of the Council once in every year : so that a period of twelve months shall not intervene between the last sitting of a Council in one session and its first sitting in the next. Members receive allowances of £120 each annually, subject to deductions for absences. There is freedom of speech, and members are not liable to action at court for any speech or vote in a Council.

2. **Powers of Provincial Councils.**—The legislative powers of Provincial Councils are defined and limited by sections 85 to 91 of the *South Africa Act* and a series of *Financial Relations Acts*, commencing in 1913, which determined the sphere of action assigned to these bodies and regulated the financial responsibilities and powers of the Provinces in relation to the central Government. A summary of these enactments in their effect on the system of Provincial administration was given in previous issues of this *Year Book* (Nos. 1 to 6). In general, the evolution of the Provincial system has been in the direction of extending the authority of the Councils in matters of purely local concern, while limiting more strictly the scope of their activities in directions bordering on wider national issues. The more important developments of the system have centred round the financial aspect, coupled with the question of lower education, the control of which remains the most distinctive function of the Provincial Councils. Commissions of inquiry appointed in 1915 (Jagger Commission), 1922 (Baxter Commission), and 1923 (Education Administration Commission) investigated and reported upon these and other aspects of Provincial administration.

The fiscal organization of the Provinces, as regulated by Union legislation from time to time, is outlined in Chapter XXII of this *Year Book*. Other phases of Provincial government are dealt with in various sections of the *Year Book*, as indicated in paragraph 3 of § 5 above.

Any ordinance made by a Provincial Council has effect in and for the Province as long and as far as it is not repugnant to any Act of Parliament. Assent to ordinances passed by a Provincial Council must be obtained from the Governor-General-in-Council (Section 90 of the *South Africa Act*). Provincial Councils may recommend to Parliament the passing of any law relating to any matter in respect of which Councils are not competent to make ordinances.

§ 7. South Africa and the League of Nations.

1. **South Africa's Connection with the League.**—The Union of South Africa's most important connection with the League of Nations at present is its responsibility as Mandatory Power for South-West Africa. As such, the Union undertakes the administration of this territory and the annual report of the Administrator is sent by the Union Government to the Permanent Mandates Commission of the League, who submit their observations on it to the Council and the Assembly. The resolutions of each body are communicated thereafter to the Union by the Secretary-General of the League.

The League invite a representative of each Mandatory Power to be present at the yearly meeting of the Permanent Mandates Commission.

At the Assembly, the annual meeting of delegates from the States Members of the League which is held at Geneva, the Union is entitled to three representatives.

The International Labour Office is the largest branch of the League. It holds an annual Conference, six of which have hitherto been held and South Africa has been represented at each. South Africa is entitled to send four delegates to this Conference, one workers' delegate, one employers' delegate, and two Government delegates, together with advisers. The Conference is held at Geneva and considers conditions of employment and questions connected with the social welfare of the workers from an international aspect; it deals with the industrial and social problems of the day. Each Conference has drafted Conventions and Recommendations by which an endeavour is made to secure improved and uniform social and labour conditions in those States which are members of the League. (See Chapter V of this *Year Book*.)

The Union Government, as a Member of the League, receives detailed documents from the Secretariat describing the work of the various committees, and constant correspondence is maintained with the Secretary-General on matters in which the League is interested. Such subjects include disarmament, finance, commercial arbitration, customs facilities, freedom of communications and transit, traffic in drugs, traffic in women and children, health and educational measures. All documents of importance are laid on the table of the House of Assembly.

At the request of the Economic and Financial Section of the League, the Union Office of Census and Statistics supplies the League with all desired statistical information in regard to the finances and economic conditions of the Union, the more important statistics being cabled monthly to the League for the purposes of its *Monthly Bulletin of Statistics*.

2. **Contribution of South Africa to the League.**—According to Article 6 of the Covenant of the League of Nations the expenses of the League were to be apportioned among the Members of the League in the same manner as is followed in the division of the expenses of the International Bureau of the Universal Postal Union. Applying that method, the Union of South Africa was classified as a country of the *First class*. Exception was taken to this classification and on the 30th September, 1922, a reclassification was adopted by the Assembly placing South Africa in the *Fourth class*, and reducing the annual contribution for 1922 from 1,041,666 gold francs to 332,388 gold francs.

The total expenditure of the League, according to the Budget for the seventh period (1925), amounted to 22,658,138 gold francs, apportioned as follows :—

Secretariat and Special Organizations.	*Gold Francs.*
Sessions of the Assembly and Council	524,500
Preliminary Expenses for the erection of new Conference Hall	250,000
General Services of the Secretariat	6,196,861
Special Organizations of the League	5,245,973
Buildings, permanent equipment, etc	1,142,000
Working Capital Fund	50,000
Other Organizations.	
International Labour Organization	7,340,595
Permanent Court of International Justice	1,908,209
TOTAL	22,658,138

The following contributions to the League have been paid by South Africa :—

Year.	*Gold Francs.*	£ s. d.
1919	—	16,234 0 0
1920	523,000	28,462 17 4
1921*	324,592	15,916 8 5
1922	332,388	14,353 6 11
1923	407,947.68	17,347 12 7
1924	347,613.12	15,061 17 2
1925	363,499.54	14,465 5 3

§ 8. Electorate.

1. **Qualifications of Parliamentary Voters.**—Parliament, in terms of section 35 (i) of the *South Africa Act*, may by law prescribe the qualifications which entitle persons to vote at the elections of members of the House of Assembly : subject to the limitation that no such law shall disqualify, by reason of race or colour only, persons who are or may become registered voters under the law of the Cape of Good Hope unless passed by a two-thirds majority of both Houses of Parliament sitting together. No Act has yet been passed by the Union Parliament dealing with the qualifications of voters. Act No. 12 of 1918 provides for the registration of voters for the House of Assembly and all Provincial Councils, and for contingent matters.

(1) *All Provinces.*—Throughout the Union the franchise is confined to male adults.

(2) *Cape Province.*—No distinction is made as regards race or colour.

The franchise is based on (*a*) education, and (*b*) occupation of property *or* income :—

(*a*) *Education.*—Although qualified in every other respect, no person may be registered as a voter unless he is able to sign his name and write his address and occupation. Persons who were registered as Parliamentary voters in any fiscal division of the Cape Province on the 1st January, 1893, are exempt from this provision, provided they can show that they have since continued to reside in such division.

(*b*) *Occupation, Property, or Income.*—Broadly speaking, it is necessary for a person to possess *either* of the following qualifications :—

(i) *Occupation.*—I.e. occupation within the Cape Province (either solely or jointly with other persons) for not less than twelve months next before the day on which the registration commenced, and for the last three months of such period within the electoral division for which such person claims to be registered, of a house, warehouse, shop, office, or other building which, either separately or jointly with any land within the electoral division, is of the value of £75. If there is more than one joint occupier, the share of each occupier claiming to vote must be of the value of £75.

(NOTE.—In the case of persons who were registered on the 1st January, 1893, and who have continued to reside in the division in which they were residing on that date, the value of the premises need only be £25.)

Or,

(ii) *Salary or Wages.*—I.e. real and *bona fide* receipt for not less than twelve months of salary or wages at the rate of not less than £50 per annum. In order to possess this qualification, it is necessary that the person shall have really and *bona fide* earned such salary or wages within the Cape Province for the space of twelve months next before the day on which the registration commenced, and, in addition—

(*a*) that for the last three months of such period he shall have earned such salary or wages within the electoral division for which he claims to be registered ; *or*

(*b*) that for the last three months of such period he shall have resided within the electoral division for which he claims to be registered ; *or*

(*c*) that at the time the registration commenced he shall have actually and *bona fide* taken up his residence in the electoral division for which he claims to be registered.

(NOTE.—In the case of persons who were registered on the 1st January, 1893, and who have continued to reside in the division in which they were residing on that date, receipt of a salary of £25 per annum plus board and lodging is also a qualification.)

---

* The total claim for 1921 amounted to 1,041,666 gold francs, which amount has now been paid in full, as follows :—

In 1921	Gold francs	324,592
March, 1923	,,	109,378.77
March, 1924	,,	153,678.35
September, 1924	,,	26,318.79
March, 1925	,,	210,679.16
November, 1925	,,	217,018.93
TOTAL	,,	1,041,666

Special provisions in force in the former Province of Griqualand West (comprising the fiscal divisions of Kimberley, Barkly West, Hay, and Herbert):—

(i) *Occupation or salary or wages qualifications.*—In the case of a person who at the date of the taking effect of Act No. 9 of 1892 was registered in any fiscal division formerly comprised in the Province of Griqualand West, and who has continued to reside in the fiscal division in which he was registered when the Act took effect, it is enough to show that—

(*a*) for the space of six months immediately preceding the day when the registration of voters commenced, he had occupied premises of the value of not less than £25; *or*

(*b*) for the space of six months immediately preceding that date he was in receipt of salary at the rate of not less than £100 a year, or £50 a year in addition to his board and lodging.

(ii) *Diggers' qualification.*—Every person not otherwise disqualified by law who in any electoral division formerly comprised in the Province of Griqualand West for the space of six months immediately preceding the day when the registration of voters commenced was the duly registered holder of a licence to dig and search for diamonds in any claim or portion of a claim is entitled to be registered as a voter.

(3) *Natal Province.*—The franchise is confined mainly to Europeans.

Every male native resident in, or possessing the necessary qualification in, Natal is disqualified for registration as a voter unless he possesses a certificate from the Governor entitling him to be registered.

Persons who (not being of European origin) are natives or descendants in the male line of natives of countries which had not, prior to the 23rd May, 1896, possessed elective representative institutions founded upon the parliamentary franchise are disqualified to be registered as voters unless possessed of certificates of exemption granted by the Governor-General-in-Council. The qualifications are (*a*) ownership, (*b*) income.

(*a*) *Ownership* of immovable property of the value of £50 or the *renting* of such property of the yearly value of £10 within any electoral division in Natal. In the case of joint occupation, the value or the rent of the property must be sufficient to entitle each of the joint occupiers to be registered if equally divided among them.

(*b*) *Income*, inclusive of allowances equal to £8 per month or £96 per annum, together with a total residence of three years in the Union and a residence of six months out of the last seven months in the electoral division.

(NOTE.—Only persons who are not qualified on account of the property or rental qualification may claim this qualification.)

(4) *Transvaal and Orange Free State Provinces.*—The franchise is confined to Europeans

Qualification.—Residence *anywhere in the Union* for a period of six months immediately preceding the date of commencement of the registration of voters, with bona fide residence in the electoral division on that date.

2. Elections.—Prior to the date appointed for the establishment of the Union a Delimitation Commission was appointed to arrange for the necessary partition of each of the four Provinces into electoral divisions, each division to return one member. The "quota of the Union" as defined in section 34 is 2891. The "quota of each province" as defined in section 40 varies from delimitation to delimitation (see Reports of Delimitation Commission). Sections 34 and 40 of the *South Africa Act* prescribes the method of delimitation to be followed. Section 41 provides that after each quinquennial census (which is required to be taken under the Act) a similar Commission must be appointed to effect necessary redivisions and adjustments, and to provide for the allocation to any Province as the result of the increase of the European male adult population of any additional member or members of Parliament to which it may have become entitled. Any such alteration of numbers becomes effective at the next following general election. A second Delimitation Commission was appointed in 1912, after the Census of 1911, and a third under the chairmanship of Sir J. H. Lange, Kt., in July, 1919. The fourth Delimitation Commission was appointed in December, 1922, under the chairmanship of the late Sir J. H. Lange, Kt., who was succeeded by the late Sir A. W. Mason, Kt., and to it was submitted the data derived from the Population Census taken on the 3rd May, 1921. The allocation of members to each Province as determined by this Commission is given in page 93. The following table gives the result of this Census in so far as the requirements of section 34 (vi) of the *South Africa Act* are concerned.

NUMBER OF EUROPEAN MALE ADULTS—CENSUS OF 1921.

Heading.	Cape of Good Hope.	Natal.	Transvaal.	Orange Free State.	Union.
Number enumerated within the Union	170,292	41,919	149,503	49,279	410,993
Number of Members of Imperial Forces enumerated	814	26	14	2	856
TOTAL NUMBER OF EUROPEAN MALE ADULTS* (CENSUS OF 1921)	169,478	41,893	149,489	49,277	410,137
TOTAL NUMBER OF EUROPEAN MALE ADULTS* (CENSUS OF 1904)	167,546	34,784	106,493	41,014	349,837
INCREASE	1,932	7,109	42,996	8,263	60,300

* As defined in *South Africa Act* (§ 34).

3. **Registered Voters in Electoral Divisions.**—The following tables show for the last five biennial registrations in each Province the number of voters registered in each Parliamentary electoral division :—

6. **Electoral System for Provincial Councils.**—In the Cape and Transvaal Provinces the electoral divisions for members of the House of Assembly and members of the Provincial Council are coincident. In Natal and the Orange Free State, owing to the fact that only seventeen members are returned in each case for the House of Assembly, whereas each of the Provinces returns twenty-five members to the Provincial Council, the electoral divisions do not coincide, having been determined for each purpose by the Delimitation Commission. In other respects the law relating to elections for the House of Assembly applies to elections for Provincial Councils.

7. **Provincial Council Representatives and Number of Registered Voters.**—The statement below shows, in respect of each Province, the number of Provincial Council representatives and registered voters at each registration and the average number of registered voters per representative :—

PROVINCIAL COUNCIL REPRESENTATIVES AND VOTERS, AND AVERAGE NUMBER OF VOTERS TO EACH REPRESENTATIVE AT EACH BIENNIAL REGISTRATION.

PROVINCE AND YEAR.	Number of Representatives.	NUMBER OF REGISTERED VOTERS.			Average Number of Voters to each Representative.

CHAPTER III.

LOCAL GOVERNMENT.

§ 1. Powers and Duties of Local Governing Bodies.

1. **Cape of Good Hope.**—Local government in the Province of the Cape of Good Hope is administered primarily by divisional councils, municipal councils, and village management boards, these bodies being under the legislative control of the Provincial Council.

(i) *Divisional Councils.*—The powers and functions of divisional councils as most recently defined are chiefly embodied in Ordinance No. 13 of 1917, and Act No. 36 of 1919, and relate to the maintenance of roads, bridges, pontoons, and ferries, and the control of outspans and trekpaths; the destruction of noxious weeds; local rating; vehicle taxation; and public health. Divisional councils were first established in the year 1855, and the areas of their jurisdiction are the fiscal divisions of the Province.

(ii) *Municipal Councils.*—Municipal councils are empowered to act under Ordinance No. 10 of 1912 and amending Ordinances. Their functions comprise the rating of immovable property, the control of drainage, water supply and sanitation; the upkeep of burial grounds, botanical gardens, municipal roads, streets and bridges; the control of recreation grounds, and a number of other matters specified in those Ordinances. Further functions of municipal councils are set out in Ordinance No. 13 of 1917 and Act No. 36 of 1919.

(iii) *Village Management Boards.*—Village management boards are constituted under Ordinance No. 10 of 1921, and these bodies are concerned with the maintenance of public streets, the provision of water supply, the prevention or suppression of disease, the control of common lands, and similar matters. They are also affected by the provisions of section 9 (7) of Act No. 23 of 1897, Ordinance No. 13 of 1917, and Act No. 36 of 1919.

(iv) *Local Board Areas.*—Local boards are constituted under Ordinance No. 11 of 1921. They are either constituted in localities adjacent to large municipalities, where, by reason of their proximity to such bodies, it is not considered advisable to establish village management boards, or over small communities which require some form of local government rather wider in scope than the "local areas" established under the control of divisional councils and not sufficiently advanced for the establishment of village management boards. One of the main differences between local boards and village management boards is that in the former case the membership is confined to three—two being appointed by the Administrator and one elected. In the case of village management boards, all members (either three or six) are elected. The functions of the boards are very similar to those of village management boards, and they are also affected by the provisions of Ordinance No. 13 of 1917 and Act No. 36 of 1919.

(v) *Local Areas.*—Local areas may be constituted in districts under the control of divisional councils for the regulation of water supply, the use of slaughter places, the management of burial grounds, the erection of buildings, etc. These areas are constituted under Ordinance No. 13 of 1917.

2. **Natal.**—(i) *Municipal Councils.*—In the Natal Province the municipalities are governed by the *Boroughs Ordinance*, No. 19, 1924. Each borough has certain powers of sale, by public auction or in certain cases by private bargain, on freehold or leasehold of its town lands, subject in most instances to the consent of the Administrator. Town councils also have similar powers with regard to leasing any portion of the town lands for periods not exceeding ninety-nine years. Each borough is divided into not fewer than four wards, each ward returning two town councillors who are elected by the burgesses for a period of two years, one-half of the councillors retiring annually. The mayor is elected by the councillors from among their number. Town councils are in certain circumstances empowered to raise money by overdraft or otherwise, but in most instances special loan Ordinances are passed under which the flotation of loans for specific purposes on the security of the borough rates and revenues is authorized. With few exceptions licences are issued by the municipalities. The issue of liquor licences is controlled by licensing boards appointed under Act No. 38, 1896. Market rights vest absolutely in the municipalities. New by-laws and amendments of existing ones are subject to the consent of the Administration.

(ii) *Local Boards.*—The local boards are governed by Law No. 11 of 1881 and several amending laws, and have powers similar in nature to those conferred on municipalities but less extensive. In addition to all matters relating to the sale or lease of town lands, all new by-laws or amendments and particulars of the cancellation of existing ones must be referred to the Administrator for approval. All municipal and township accounts are subject to annual audit by the Provincial Auditor.

A draft Ordinance repealing and consolidating the existing laws relating to townships is at present (July, 1925) under consideration in the Provincial Council.

(iii) *Villages.*—A village may, at the instance of its householders, be brought by proclamation under the provisions of Act No. 19, 1897. The Administrator may then authorise the construction of works for the supply of water. The capital cost of the scheme is met from Government funds, and rates are imposed to cover the interest charges and the cost of maintaining the work.

(iv) *Public Health Committees.*—These have been elected under Ordinance No. 7, 1923, and amending Ordinances, for certain areas adjacent to the borough of Durban. Within its area each committee exercises the powers and carries out the duties conferred or imposed on local authorities under the Public Health Act, etc. The Ordinances empower them to levy rates and impose fees and charges for services rendered.

3. Transvaal.—*The Local Government Ord nance*, No. 9 of 1912 (amended by Ordinances Nos. 1 of 1915, 6 of 1916, 12 of 1917, 6 of 1918, 8 of 1919, 14 of 1919, 4 of 1920, 10 of 1920, 12 of 1921, 14 of 1923, 6 of 1924, 12 of 1924, and 5 of 1925), consolidated the law relating to municipal government in the Transvaal Province. This Ordinance, a comprehensive measure defining in great detail the organization and functions of each form of local authority, provides for three grades of such authorities—town councils, village councils, and health committees. Among other main laws affecting municipal government may be mentioned the *Municipal Elections Ordinance*, No. 8 of 1912 (amended by Ordinances Nos. 2 of 1914, 10 of 1914, and 4 of 1918); the *Local Authorities Rating Ordinance*, No. 6 of 1912 (amended by Ordinances Nos. 1 of 1916, 4 of 1917, 12 of 1918, 9 of 1919, 9 of 1921, and 9 of 1925), in terms of which all local authorities are empowered to levy an assessment rate; the *Local Authorities Roads Ordinance*, No. 44 of 1904, applicable to town councils only; the *Municipal Expropriation Ordinance*, No. 64 of 1903, applicable generally to town councils only, though the provisions of sections 9 to 12 inclusive apply in the case of any arbitration proceedings in connexion with any works which may be undertaken by a village council under sections 73 and 77 of Ordinance No. 9 of 1912. Under section 8 of Ordinance No. 12 of 1924 the Executive Committee of the Province has power upon the application of a village council to apply to such council the provisions of Ordinance No. 64 of 1903 and the *Town Lands Ordinances* of 1904 and 1905, applicable to town and village councils.

The *Local Government Ordinance*, No. 9 of 1912 (as amended), distinguishes between the powers and duties of the bodies formerly known as major and minor municipalities, now known as town councils and village councils respectively. Formerly the powers and duties of major and minor municipalities were identical. The effect of the Ordinance was to apportion to village councils only the simpler and more elementary powers and duties given to town councils, while the more elaborate and complex powers necessary for large communities, such as those of Johannesburg and Pretoria, were separated and can now only be conferred on town councils on good cause shown. The powers and duties of village councils are similar to those of the village management boards of the Cape Province. The Ordinance provides for a simplified election procedure for village councils and abolished much of the machinery which applied to municipalities in the smaller towns under previous legislation. A form of local government by means of health committees is provided for such committees to control matters of sanitation and public health. Additional committees may be constituted from time to time, and the Administrator may by regulation render such committees responsible for the control of water-furrows, cemeteries and pounds.

4. Orange Free State.—The system of local government in the Orange Free State embraces municipalities and village boards of management.

(i) *Municipalities.*—As soon as a community has shown that it is ripe for the grant of somewhat further powers of local self-government than are exercisable by a village board of management it may be proclaimed by the Administrator as a municipality. The powers of town councils are similar to, but cover a much wider field than, those of village boards of management. No immovable property may be alienated by a town council without the consent of the Administrator. The accounts of councils are audited by municipal auditors who are appointed by and perform their duties on behalf of the Provincial Administration.

(ii) *Village Boards of Management.*—In the case of village boards of management the boards are given power to deal with the more necessary matters appertaining to local government, e.g. the passing of regulations relating to grazing, sanitation, pounds, etc., and the raising of loans not exceeding £1,000 for public works. Subject to the approval of the Administrator, boards are empowered to frame, amend and repeal such regulations from time to time.

(iii) *Municipalities and Village Boards of Management.*—All matters affecting natives and their locations are dealt with under the *Natives (Urban Areas) Act*, No. 21 of 1923.

§ 2. Municipal Rating.

The following tabular statement shows the incidence of rating, the amount leviable, the exemptions, and the ordinances under which local authorities in the several Provinces of the Union are empowered to levy taxation for the purpose of obtaining funds to carry out local government services.

Incidence of Rating.	Amount Payable in the £1 (Maximum).	Minimum Amount Payable.	Exemptions.	Ordinances
**Cape of Good Hope.*—				
†General rate.....	4d.	—	Property of the Crown or property occupied by the Union Government or Provincial Administration as follows :—	No. 10 of 1912 as amended by No. 6 of 1914, No. 7 of 1915, and No. 17 of 1917.
†When rateable valuation exceeds £1,000,000.....	6d.	—	Land which has not been built upon or	
†Special rate.....	4d.	—	upon which permanent improvements have not been made; docks, breakwaters, etc., or any immovable property (not being dwelling-houses or other buildings from which revenue is derived by any harbour authority) which forms part of, or is used for the purpose of, harbour works; railways or railway buildings; gaols or convict stations; immovable property occupied by the Crown for naval or military purposes, provided the property belongs to the Union Government or Provincial Administration.	
Assessed upon the rateable value of immovable property (i. e. site and building valuations). Ord. No. 17 of 1917 gives municipalities the power to impose general or special rates on the site value of land only.			Places used for public worship and educational purposes, or cemeteries.	
			Land used exclusively for public schools or colleges, public libraries or museums, art galleries, etc.	
			Land used for hospitals, charitable institutions, etc.—	
			(*a*) supported by the Union Government or Provincial Administration, or	
			(*b*) supported by public charity.	
			Lines of telegraph and telephone, etc.	
			Land set out as a mining area.‡	
			Land used as public slaughter-houses.	
			In Cape Town Houses of Parliament and immovable property under the control of the Railway Department (exclusive of dwelling-houses) in the docks area.	
			National botanical gardens and improved Government forest lands, and land and buildings (other than those used for trading purposes) forming portions of Groot Schuur estate set aside as a park.	No. 12 of 1916.
			Land, together with buildings, vested in trustees on behalf of any sporting organizations and used solely for athletic sports and pastimes or leased from municipal councils or from the Imperial or Union Government or the Provincial Administration for such purpose (excluding racecourses).	No. 25 of 1920.
Emergency rate..... (Applicable to Wynberg, East London, Kimberley, and Port Elizabeth, or any other municipality, except Cape Town, approved of by the Administrator.)	2d.	—	—	No. 13 of 1921.
Water rate (Cape Town) Assessed upon the value of rateable property.	½d.	—	—	No. 4 of 1917.

* A Provincial Immovable Property tax of ⅝d. in the £1 is collected on the valuation of all immovable property, with certain exemptions, within the Cape of Good Hope and paid into the Provincial Revenue Account.

† Municipal Councils in the Cape of Good Hope Province cannot exceed these rates nor levy a special rate unless the enrolled voters by appeal to them have determined that a higher rate be levied.

‡ Ordinance No. 4 of 1913 provided that rates were to be recovered on houses and buildings within any mining area within the Municipality of Kimberley.

MUNICIPAL RATING—*continued.*

Incidence of Rating.	Amount Payable in the £1 (Maximum).	Minimum Amount Payable.	Exemptions.	Ordinances.
Natal.—				
General rate..... Water rate..... Assessed upon immovable property as a whole or upon land and buildings separately.	Amount assessed annually according to the estimated amount of money required for service of municipal year.	—	Land and/or buildings solely appropriated to, or held in trust for, religious, educational, or charitable purposes, burial ground, infirmary, or hospital; land let under agricultural lease and used only for agricultural, pastoral, and like purposes.	No. 19 of 1924.
Transvaal.—				
Original rate (compulsory) on the site value of land	1d.	*5s.	Any interest in land the property *and* in the occupation of the Crown (in the cases of the magisterial districts of Boksburg, Germiston, Johannesburg, and Krugersdorp, the municipality of Klerksdorp, and Warmbaths any interest in land held by the Crown), provided that all property vested in the Governor-General-in-Council for railway purposes shall, so far as the same is used for residential purposes by persons employed by the South African Railways be deemed to be rateable property.	No. 6 of 1912 as amended by No. 1 of 1916, No. 4 of 1917, No. 12 of 1918, No. 9 of 1919. No. 9 of 1921, an No. 9 of 1925.
An *additional* rate may be levied upon the site value of land up to..	6d.	—	Any interest in land used exclusively for public worship or for schools registered in the office of the Department of Public Education or boarding-houses or hostels maintained in connexion with such schools.	
A rate of an amount in the £1 equal to or less than the additional rate may be levied upon the value of improvements, provided that—				
(1) where the rate, which is levied upon the value of improvements, is equal to the additional rate, the rate shall not exceed in the aggregate.....	3d.	—	Any licence or right to dig for or prospect for precious stones or metals on any portion of land assigned for that purpose; and any portion of land held or occupied exclusively for the exercise of such rights; provided that no land or buildings used for residential purposes or for purposes not incidental to mining operations, whether by persons engaged in mining operations or otherwise, shall be deemed to come within the exception.	
(2) where the rate, which is so levied, is less than the additional rate, such additional rate shall not be of a greater amount in the £1 than is necessary, together with the rate upon the value of improvements to produce a sum equal to the sum which would be produced by a rate of 3d. in the £1 on the site value of land and the whole value of the improvements thereon taken together.			Any interest in land laid out and used for the purpose of sport or recreation and controlled in accordance with rules approved by the local authority in so far as such interest is held for such purposes as aforesaid, provided that an interest in land used as a recreation ground conducted for profit or as a racecourse shall not be entitled to the benefit of this exemption.	
The Administrator may sanction an additional rate higher than that stipulated.			Land being not less than one morgen in extent, *bona fide* and exclusively used as agricultural land, is rated upon half its agricultural value.	
			Land within the jurisdiction of a health committee, held by the Governor-General or the Government in trust for any future municipal council, or reserved under law for the use and benefit of a health committee.	No. 9 of 1925.

* Minimum charge in respect of any property or interest on rates imposed

MUNICIPAL RATING—*continued.*

Incidence of Rating.	Amount Payable in the £1 (Maximum).	Minimum Amount Payable.	Exemptions.	Ordinances.
Orange Free State.—				
General rate.....	*1¼d.	†£1	Land or immovable property belonging to the Crown or the Government of the Union or the Provincial Administration; churches or other buildings used for religious worship or educational purposes; libraries, schools, etc.; any land or buildings owned, leased, or held by agricultural societies; burial grounds; hospitals or other buildings supported by public charity or used exclusively for charitable purposes; any land held in trust for religious purposes.	No. 4 of 1913, as amended by No. 14 of 1914, No. 8 of 1917, No. 12 of 1920, No. 16 of 1921, No. 11 of 1922.
Water rate.....	*1½d.	†£3		
Assessed upon immovable property (site and buildings) or on valuation of land only. *Special rates* may also be imposed by a meeting of registered owners to such amount and for such period as the meeting may lay down.			These exemptions do not apply to private tenants of Crown or Government property.	
			Exemption *may* be granted by town council if satisfied that any property is supported by public charity or used exclusively for charitable or religious purposes and that any profits derived therefrom are also devoted to such purposes.	No. 14 of 1923.
Sanitary rate (Bloemfontein only)	*2d.	—	—	No. 4 of 1913.

* These are the maximum rates leviable by a town council without consulting the registered owners of immovable property—with the consent of registered owners the rates can be increased to any figure specified in such consent.

† The minimum amounts shown are leviable only when specially authorized by a meeting of registered owners.

§ 3. History and Development of Four of the Principal Towns.

1. **Johannesburg.**—When President Kruger in 1886 proclaimed the farms upon which Johannesburg now stands as a public diggings there were not more than fifty persons, mostly drawn thither by the reported discovery of gold, resident in the valley. From a mining camp the place rapidly developed into a straggling mining town, and within a couple of decades into a progressive modern city. To-day, less than forty years after its foundation, Johannesburg is the largest town in the Union, and in point of buildings, streets, open spaces, and other civilized amenities bears comparison with any of the older established towns in the country.

The phenomenal growth of the town can be gathered from the following population figures. A census taken by the Stadsraad in 1896 returned the population as 50,907 Europeans and 51,171 non-Europeans (Asiatic, coloured, and native). In 1902, shortly after the conclusion of the South African War, a police census gave the population as 61,780 Europeans and 47,672 non-Europeans. The census of 1904 showed Europeans 83,363 and non-Europeans 72,279. In 1911 the Europeans numbered 119,953 and non-Europeans 117,151, whilst the census of 1921 indicated an increase to Europeans 150,286 and non-Europeans 132,685. The estimated population at the 30th June, 1925, was 162,924 Europeans and 139,156 non-Europeans. The preliminary figures of the 1926 census show 168,321 Europeans.

In the main, Johannesburg owes its existence and development to the gold mining industry. The fields upon which it stands are still the largest and richest in the world, but hand in hand with that industry the town is rapidly developing into a centre for agricultural and ranching products, and as the northern areas are further exploited the progress of Johannesburg is further assured. Its position in close proximity to the iron fields and the large Witbank coal field of the Transvaal foreshadows immense possibilities of development, and stability for industries when the gold-bearing areas have ceased to produce on the present scale.

The industrial development of the town since 1915 has been truly remarkable. In the industrial area described as *Southern Transvaal*, which comprises Johannesburg and the neighbouring district dependent upon Johannesburg, the number of factories increased from 862 in 1915 to 1,748 in 1921; the value of machinery and plant from £7,114,877 to £11,402,201, and the total number of employees from 29,050 to 56,076. The wages and salaries paid which in 1915 were £3,628,560, increased to £8,578,781 in 1921, and the gross value of output from £12,958,059 to £31,080,957.

Electricity and gas for lighting and power are provided primarily by municipal plant, and in addition the lines of the Victoria Falls and Transvaal Power Co., Ltd., which possesses large generating stations, radiate all over the Reef. The tramway system, which is municipally owned, has an aggregate length of 73 miles, and during the year 1922–23 carried 54,032,459 passengers. Water is supplied by the Rand Water Board, a body constituted in 1903 to supply the municipalities along the Reef with water in bulk. The quantity of water drawn from boreholes available to the Board in 1905 was 2½ million gallons per diem, and was augmented in stages in subsequent years by an additional 7½ million gallons. The construction recently of a barrage across the Vaal River has made possible a further supply of 20 million gallons, 5 millions having been made immediately available as an initial quantity from this source.

Johannesburg is possessed of some remarkably fine buildings, the most outstanding amongst them being the Corner House, the headquarters of the principal mining groups, the Chamber of Mines, the Stock Exchange, the Town Hall, Law Courts, and the South African Institute for Medical Research. The University buildings when completed will add another imposing addition to the already considerable number of notable structures.

The educational facilities of the town are as good as any to be found elsewhere in the Union. In addition to the numerous schools, both Government and private, providing primary education, there are a considerable number of well-known secondary schools teaching up to the matriculation standard.

In 1922, the University College, which had developed out of formerly existing technological institutions, was incorporated as the Witwatersrand University. The site for the University at Milner Park was given by the Johannesburg Municipality, which, together with commercial and industrial organizations and private individuals, has donated funds towards the cost of erecting the necessary buildings.

The town is well equipped with sports grounds, swimming-baths, theatres, and public libraries; in fact there is no amenity of modern life that does not find its place in Johannesburg.

2. **Kimberley.**—The city of Kimberley, which now includes the former township of Beaconsfield, was formerly known as New Rush or Colesberg Kopje, and named after the late Lord Kimberley, Colonial Secretary in the early seventies of last century. It is the capital of Griqualand West, situated 647 miles from Cape Town, and its elevation above sea level is 4,012 feet. The total population, including natives in the mine compounds, is approximately 40,000. The present site of Kimberley was, in the year 1870, represented in a photograph by a thorn tree, a Bushman, and a kopje.

The news of the discovery of the Kimberley Mine, on Sunday, 16th July, 1871, induced practically all those who were digging for diamonds on the banks of the Vaal to rush to the newly discovered mine. The republic of the Orange Free State claimed dominion over these diggings; they were also claimed by a Griqua chief, Nicholas Waterboer, as a portion of his possessions. On the 27th October, 1871, as the result of protracted negotiations, Waterboer's territory, including the diamond area, was proclaimed a British colony, under the name of Griqualand West, and some time later the Government of the Orange Free State was awarded a solatium of £90,000, whilst Waterboer was granted a handsome pension.

Government Proclamation No. 22 of 1873, dated the 5th July, 1873, promulgated in a *Government Gazette Extraordinary* on the 18th July, 1873, set forth ". . . . the encampment and town heretofore known as De Beers New Rush, the Colesberg Kopje No. 2, or Vooruitzigt, shall henceforth be and be designated the town of Kimberley. . . . ."

The Imperial Government, within a few years, found difficulty in governing the Crown Colony of Griqualand West, and made overtures to the Cape Government to annex the Province, and the Cape Parliament passed Act No. 39 of 1877 making provisions for the annexation of Griqualand West.

Three years later the Legislative Council of Griqualand West carried a motion for annexation, and on the 18th October, 1880, the Province of Griqualand West became an integral portion of the Cape Colony.

The drawback at the diggings, which was severely felt at the outset, was the want of water, as there was only a meagre supply from Dutoitspan and from a few fountains that soon dried up.

Towards the close of the seventies a scheme to pump water from the Vaal River, seventeen miles distant, was laid before the Municipal Council of Kimberley, and that body in 1880 granted concessionary rights to the Kimberley Waterworks Company, Limited. In 1883 the company commenced the supply of water, which it controlled until 1921, when the city council purchased the undertaking.

Kimberley was one of the first towns in any part of the world to have electric street lamps, a considerable number of which were installed in the year 1885. The spirit of enterprise then evinced has continued to survive, and excellent progress has been made in matters affecting the public welfare. A considerable portion of the city has been sewered, and the system is being gradually extended.

Kimberley is provided with an excellent electric tramway service, owned and controlled by the De Beers Consolidated Mines, Limited, and the track now laid and operated totals 34½ miles. 1½d. stages are in vogue, and the fares, having regard to the length of the stages, are the cheapest in South Africa.

The city is exceedingly well served with educational establishments, and possesses several imposing colleges and schools, the principal being of recent design and modern construction, standing in their own grounds. There is a central public library as well as one in Beaconsfield, controlled by committees appointed by the subscribers ; also a splendid museum, controlled by a public committee. The handsome building which houses the museum was presented to the town by Mrs. Margaret McGregor, in memory of her late husband, Councillor Alexander McGregor, who was mayor in the year 1886. Kimberley is also the seat of the Griqualand West Local Division of the Supreme Court of South Africa, and this High Court has jurisdiction over an immense area.

The soil of Griqualand West is very fertile, and several irrigation works for the utilization of the waters of the Vaal, Modder, and Riet Rivers by means of natural gravitation schemes have been completed. Further extensive irrigation schemes are under consideration by Government along the Vaal River between Kromellenboog and Delport's Hope, embracing a frontage of 130 miles. Heavy crops of cotton of the best grades have been grown in and around Kimberley, and cotton plantations are being rapidly extended.

Kimberley is a great sporting centre, and the amenities to be enjoyed include practically every form of recreation, provided by the many athletic clubs. The invigorating quality of the dry air during the winter months is well known, and a holiday spent in and around Kimberley, especially during the shooting season, is a most delightful experience.

3. **Port Elizabeth.**—Historical records almost unquestionably point to Algoa Bay as the excellent harbour into which Bartholomew Diaz sailed on the 14th September, 1486, on his memorable voyage of discovery, and which he named "Bahia da Logoa," and St. Croix as the island where in accordance with his custom he erected a cross.

The present day history of the port commences with the establishment of a British military post in 1789, and the construction of a fort, named Fort Frederick, on high ground overlooking the bay and protecting the landing.

In 1812, after the district had been cleared of hostile Kaffirs, a trading station was established to which was attached a tannery, cooperage, and saw-mill. When the British settlers landed in 1820 the settlement consisted of about a dozen dwellings in addition to the military buildings, some poor farmhouses, and a few mud huts.

The subsequent development of the surrounding districts and the admirable geographical situation of the port soon led to its rapid growth, and it early acquired the position of the premier produce centre of the Cape Colony.

The early, hazardous methods of landing and loading merchandise by means of surf-boats on the beach were soon succeeded by the construction of jetties, which made it possible for lighters to discharge and load freight with a minimum of risk and a great increase in efficiency. The capacity of some of these lighters at the present time is 200 tons burden.

Railway construction into the interior, commenced in 1873, still further contributed to the rise and importance of the town, and during the early years of the Witwatersrand gold mining industry the greater portion of the material and supplies for developing the mines was landed and conveyed through the port, which even at that time, but more so to-day, was well equipped with extensive warehouse and ground accommodation to facilitate the sorting and handling of merchandise.

A breakwater of solid concrete 8,500 feet in length is under construction which when completed will ensure the rapid loading and unloading of vessels at all times and in all weathers.

From the few small buildings and collection of mud huts which formed the settlement a century ago, Port Elizabeth has expanded into a modern town which with its suburbs, Walmer and Korsten, had a European population in 1921 of 26,228 persons. In addition, there were 20,395 non-Europeans, making a total of 46,623 all races. Contrasted with the year 1865, when the first population census of the Cape Colony was taken, the inhabitants then only numbered 6,886 Europeans and 1,814 non-Europeans. The preliminary results of the 1926 census show the European population of the same areas as 33,071.

The principal street boasts of some remarkably fine buildings, and the residential site on the hill is well situated and picturesquely laid out.

The water-supply of the town is owned and operated by the municipality. The supply is drawn from a catchment area situated within the district of Uitenhage. The main storage reservoirs, three in number, impound a total of 337 million gallons of water, and the source of supply is so dependable that during periods of severe drought the level of the reservoirs has been but little affected.

A comprehensive scheme of water-borne sewerage has been authorized at a cost of £500,000. The sum already allocated to sewer work alone amounts to £323,000.

The electrical plant, also a municipal undertaking, was first installed in 1905, but had to be considerably enlarged in 1911. The rapid industrial growth of the town has necessitated

still further expansion of the works, and considerable additions were put in hand and completed in 1924.

The development of industries in recent years is little less remarkable than the growth of the town itself. Tanneries and boot factories on an unpretentious scale had been in existence for a number of years, but during the Great War, when freight and materials were difficult to obtain, large works for the production of high-class footwear sprang into being. Port Elizabeth can easily lay claim to being the centre of the leather and boot industry of the country. Factories producing foodstuffs, furniture, etc., and using modern machinery are also located in the town, and only recently the Ford Car Company established an assembling factory, where all Ford cars designed for use in South Africa are put together.

The tramway system, established in 1897, is owned by a private company, which operates 10 miles of route. The lines extend from the north to the south end of the town, with an extension to the popular holiday resort at Humewood. The residential part of the hill is served by a circular route.

The town is well served by educational institutions providing both primary and secondary education. The Collegiate High School for Girls and the Grey Institute High School for Boys are both widely-known schools throughout the Eastern Province.

The Public Library, founded in 1848, occupies a spacious building in the Market Square, and contains over 47,000 volumes and 3,000 pamphlets. The present building was opened in 1902 and cost £32,000. A smaller library at Northend contains 8,000 volumes.

4. **East London.**—The history of East London commences when in 1846 troops and stores were landed at the mouth of the Buffalo River in connexion with the prosecution of the seventh Kaffir war. The stores were then landed, as was merchandise for a considerable number of years afterwards, by means of surf boats.

As European civilization spread eastwards and Kaffraria became settled, King William's Town rose into commercial prosperity, and the settlement of the German Legion within the vicinity as agriculturalists having proved a success, the Government, owing to increasing shipping requirements, called for and accepted plans for the construction of a breakwater. The first stone of this structure was laid in 1872, and coincides with the turning of the first sod of the East London–Queenstown section of railway.

Until 1874 only very small vessels were able to enter the river but between 1874 and 1875 the first steam vessel on her voyage to and from Natal, and a number of larger sailing vessels crossed the bar and were berthed inside by the aid of a tug provided for towing purposes. Dredging was commenced in 1886, and the river is now kept at a uniform depth, which allows all but the largest mail steamers to enter.

The settlement, at first established on the west bank of the river, had extended by 1880 to the east side, and in that year became a corporate town by Act of Parliament. In 1925 the town possessed 48 miles of macadamized streets and 54 miles of pavements and hardened footpaths. It is equipped with municipal abattoirs, up-to-date steam disinfecting plant, clinic for infectious diseases, and isolation hospital. A scheme of water-borne sewerage estimated to cost £285,000 was commenced in 1923 and is nearing completion.

The municipal electric supply scheme, inaugurated in 1899, was carried out simultaneously with the construction of an electric tramway system, and provides power for lighting, tramway services, and harbour requirements.

The water supply is obtained from an impounding reservoir constructed on the Umzoniana River, with a storage capacity of 275 million gallons. This, with the other reservoirs, gives the city a total storage capacity of 371 million gallons.

The population, which in 1875 numbered 833 Europeans and 2,134 non-Europeans, had increased to 4,760 Europeans in 1891, the non-Europeans remaining stationary. Twenty years later, in 1911, the Europeans totalled 12,522 and the non-Europeans 8,770, while the census of 1921 showed the Europeans to have increased to 16,944 and the non-Europeans to 12,339. These figures are significant as showing the steady and rapid progress of the port and the great development taking place in the interior. The preliminary figures of the 1926 census show a European population of 18,455 and a non-European of 17,802.

The town possesses two public libraries, maintained by subscriptions and Government grants, and an excellent municipal market. The Frere Hospital, situated within an extensive enclosure, is a well-equipped and modern institution.

Within recent years the popularity of the town as a seaside resort has increased tremendously.

§ 4. Local Governing Bodies.

1. **Municipalities.**—The following table gives a list of all municipalities proclaimed in each Province, together with particulars as to population, revenue, expenditure, rateable valuation, indebtedness, and the mileage of streets and roads. The information contained in the table is derived from returns furnished under the *Statistics Act.*

(i) MUNICIPALITIES OF CAPE OF GOOD HOPE, 1923–24.

Name.	Population, 1921.		Revenue.	Expenditure.	Rateable Valuation.	Indebtedness at End of Year.	Length of Streets and Roads.
	European.	Other.					
			£	£	£	£	Miles.
Aberdeen	1,774	932	2,498	2,836	175,937	531	15

2. **Other Local Governing Bodies.**—The subjoined lists give the names of all local governing bodies in the Union, other than municipalities, which are enumerated separately in the preceding section.

CAPE OF GOOD HOPE.

VILLAGE MANAGEMENT BOARDS.

Alexandria.	Frankfort.	Marydale.	Ritchie.
Alicedale.	Garies.	Merweville.	Rooigrond.
Amalinda.	Goodwood.	Napier.	Salem.
Bellvale.	Gordon's Bay.	Niekerks Hope.	Springbok.
Bellville.	Gouda.	Nieuwoudtville.	Tylden.
Berlin.	Haarlem.	Olifants Hoek.	Ugie.
Blinkwater.	Hanover.	Pacaltsdorp.	'Umnxesha.
Boetsap.	Herbertsdale.	Parow.	Van Wyksdorp.
Bonnievale.	Hertzog.	Paterson.	Vredenburg.
Brand Vlei.	Hoedjes Bay.	Pooles Bay.	Warrenton.
Braunschweig.	Jamestown.	Postmasburg.	Whittlesea.
Breidbach.	Joubertville.	Rawsonville.	Willemsmit.
Burgerville.	Keimoes.	Rhodes.	Wolseley.
Daniels Kuil.	Kei Road.	Riebeek Kasteel.	Wooldridge.
Darling.	Korsten.	Riebeek West.	Zuurbraak.
De Rust.	Loeriesfontein.	Rietbron.	
Dysseldorp.	Macleantown.		

Native Territories.

Bizana.	Mount Fletcher.	Nqamakwe.	Tabankulu.
Cedarville.	Mount Frere.	Port St. Johns.	Tsolo.
Mount Ayliff.	Mqanduli.	Qumbu.	

LOCAL AREAS UNDER ORDINANCE NO. 13 OF 1917.

Arniston.	Fish Hoek.	Karreedouw.	Pinelands Garden City.
Bethalsdorp.	Grabouw.	Kirkwood.	Theronsville.
Blanco.	Hamburg.	Lamberts Bay.	Van Wyksvlei.
Citrusdal.	Hawston-Middelvlei.	Middledrift.	Waterford.
Ferreira Town.	Jeffrey's Bay.	Mossel River.	

DIVISIONAL COUNCILS.

Aberdeen.	East London.	Laingsburg.	Robertson.
Albany.	Elliot.	Maclear.	Somerset East.
Albert.	Fort Beaufort.	Mafeking.	Stellenbosch.
Alexandria.	Fraserburg.	Malmesbury.	Sterkstroom.
Aliwal North.	George.	Maraisburg.	Steynsburg.
Barkly East.	Glen Grey (District Council).	Middelburg.	Steytlerville.
Barkly West.	Gordonia.	Molteno.	Stockenstrom.
Bathurst.	Graaff-Reinet.	Montagu.	Stutterheim.
Beaufort West.	Hanover.	Mossel Bay.	Sutherland.
Bedford.	Hay.	Murraysburg.	Swellendam.
Bredasdorp.	Herbert.	Namaqualand.	Tarka.
Britstown.	Hopetown.	Oudtshoorn.	Tulbagh.
Caledon.	Humansdorp.	Paarl.	Uitenhage.
Calitzdorp.	Jansenville.	Pearston.	Uniondale.
Calvinia.	Kenhardt.	Peddie.	Van Rhynsdorp.
Cape Town.	Kimberley.	Philipstown.	Victoria East.
Carnarvon.	King William's Town.	Piquetberg.	Victoria West.
Cathcart.	Knysna.	Port Elizabeth.	Vryburg.
Ceres.	Komgha.	Prieska.	Williston.
Clanwilliam.	Kuruman.	Prince Albert.	Willowmore.
Colesberg.	Ladismith.	Queenstown.	Wodehouse.
Cradock.	Lady Grey.	Richmond.	Worcester.
De Aar.		Riversdale.	

NATAL.

LOCAL BOARDS.

Charlestown.	Harding.	Paulpietersburg.	Umkomaas.
Eshowe.	Howick.	Richmond.	Verulam.
Geluksburg.	Louwsberg.	South Shepstone.	Weenen.
Glencoe.	Mooi River.	Stanger.	

TRANSVAAL.

VILLAGE COUNCILS.

Amersfoort.	Duivelskloof.	Machadodorp.	Sabie.
Amsterdam.	Dullstroom.	Morgenzon.	Schweizer-Reneke.
Balfour.	Erasmus.	Nelspruit.	Ventersdorp.
Belfast.	Hendrina.	Nigel.	Wakkerstroom.
Bloemhof.	Innesdale.	Nylstroom.	Willemsdal.
Breyten.	Lichtenburg.	Piet Retief.	Wolmaransstad.
Carolina.	Louis Trichardt.	Potgietersrust.	Zeerust.
Christiana.	Lydenburg.		

HEALTH COMMITTEES.

Alberton.	Elsburg.	Koster.	Pilgrims Rest.
Alexandra.	Fochville.	Leslie.	Rodeon.
Brits.	Graskop.	Maquassi.	Trichard.
Coligny.	Greymont.	Messina.	Tzaneen.
Delareyville.	Hartebeestfontein No. 624.	Naboomspruit.	Warmbaths.
Delmas.	Kinross.	Ottosdal.	Witpoort.
Eendracht.			

ORANGE FREE STATE.

VILLAGE BOARDS OF MANAGEMENT.

Bultfontein.	Van Stadensrust.	Waterkloof.	Wesselsbron.
Oranjeville.			

3. **Statistics.**—Owing to the absence in the past of a compulsory system for the collection of detailed information in regard to local bodies, the statistics given in this section, which are derived from returns furnished by the individual local authorities, are necessarily incomplete. In the exercise of powers conferred by the *Statistics Act* of 1914, regulations were issued in 1920 making it obligatory to render these returns and ensuring full and reliable statistics in future years.

(*a*) *Municipal Roads and Bridges.*—The following tables show the mileage of streets and roads and the number of bridges under the control of municipalities and village management boards in the Cape, Natal, Transvaal, and Orange Free State Provinces, also the expenditure, for a series of years:—

(i) MILEAGE OF STREETS AND ROADS AND NUMBER OF BRIDGES UNDER CONTROL OF MUNICIPALITIES AND VILLAGE MANAGEMENT BOARDS, CAPE OF GOOD HOPE, NATAL, TRANSVAAL, AND ORANGE FREE STATE, TOGETHER WITH EXPENDITURE, 1919-20 TO 1923-24.

Heading.	1919–20.	1920–21.	1921–22.	1922–23.	1923–24.
Cape of Good Hope—					
Streets and Roads....miles	2,310	2,225	2,227	2,227	2,227
Bridges.....number	294	234	225	217	203
*Expenditure.....£	245,414	267,138	276,229	263,401	305,930
Natal—

§ 5. Statistics of Principal Municipalities.

1. **City of Cape Town.**—An account of the history and development of Cape Town was given in Chapter I of earlier issues of this *Year Book*. The population of the city in the years 1911, 1918, 1921, and 1926 is reflected in the following table :—

Year.	European.	Other.	Total.
1911	78,412	71,719	150,131
1918	89,174	—	—
1921	101,685	81,672	183,357
1926	112,548*	—	—

* Preliminary unaudited figures.

In the subjoined tables are shown the financial results of the Corporation's activities for a series of years, and general statistics are given to show the progress made in various directions since unification in 1914 :—

(i) CITY OF CAPE TOWN—GENERAL STATISTICS, 1920 TO 1923.

Description.	1920.	1921.	1922.	1923.
Indebtedness at 31st December*.....£	6,271,668	6,503,386	6,699,221	6,588,241
Sinking Fund—				
Accumulations.....£	1,074,797	1,178,659	} 1,216,945	1,327,924
Repayments.....£	837,832	987,359

2. **Borough of Durban.**—The town of Durban was constituted a Borough in 1854, under Ordinance No. 1 of 1854 (Natal), with a Mayor and Town Council. The population of the Borough in the years 1911, 1918, 1921, and 1926 was as follows:—

Year.	European.	Other.	Total.
1911	33,252	39,345	72,597
1918	41,865	—	—
1921	47,358	48,183	95,541
1926	53,342*	—	—

*Preliminary unaudited figures.

The following table gives particulars regarding receipts and expenditure for the municipal years (ending 31st July) 1920–21 to 1923–24:—

Heading.	1920–21.	1921–22.	1922–23.	1923–24.
	£	£	£	£
Expenditure	1,640,322	1,567,574	1,538,876	2,307,281
Receipts	1,529,577	1,954,411	1,439,258	2,264,110
Excess Expenditure	110,745	—	99,618	43,171
Surplus Receipts	—	386,837	—	—
Appropriations during year	36,829	41,576	41,575	43,496
Net Surplus	—	345,261	—	—
Net Deficiency	147,574	—	141,193	86,667
Credit Balance from previous year	—	—	111,486	—
Debit Balance from previous year	86,201	233,775	—	29,707
Net Credit Balance at 31st July	—	111,486	—	—
Net Debit Balance at 31st July	233,775	—	29,707	116,374

The following tables give for a series of years particulars as to (i) the Borough Indebtedness, (ii) the Borough Fund Revenue Account, (iii) certain Borough Trading Accounts, and (iv) the Native Administration Account, the revenue from which, derived from the manufacture and sale of native beer and from lodging-house fees, forms a special fund administered in the interests of the natives.

(iv) BOROUGH OF DURBAN—NATIVE ADMINISTRATION.*

Description.	1920.	1921.	1922.	1923.	1924.
	£	£	£	£	£
Revenue	38,495	41,776	56,148	60,590	27,983
Working Expenses	38,119†	42,977	42,331	39,900	15,514
BALANCE.....£	376	‡1,201	13,817	20,690	12,469

* This Fund, the revenue from which is obtained from the sale of native beer, lodging-house fees etc., is held in trust by the Council to be utilized for the benefit of the natives, including the administration and maintenance of a location, the provision of hospital accommodation, schools, etc.
† Does not include £12,556 expenditure on Capital Account.
‡ Deficit Balance.

3. **Municipality of Johannesburg.**—The town of Johannesburg first acquired developed municipal institutions in 1897 by the foundation, under a Law enacted in that year, of a *Stadsraad* of twelve members, with a Burgomaster appointed by the Government. This body virtually ceased to exist on the outbreak of war in 1899, but was reconstituted as a nominated Council after the occupation of the town by the British. An Ordinance passed two years later gave authority for the election of a Town Council, which met for the first time in December, 1903. Since that date the European population of Johannesburg has increased from 83,902 (Census of April, 1904) to 137,873 in 1918, 150,286 in 1921, and 168,321 in 1926, and the non-European population which in 1904 was 74,678 numbered 117,151 in 1911 and 132,685 in 1921. The progress recorded in other directions, and particularly in the development of municipal enterprises, has been equally great. The tables hereunder contain details, for a period of years, as to the financial position of the Municipality—its loan indebtedness, expenditure, revenue, trading undertakings, etc.

CHAPTER IV.

EDUCATION.

§ 1. Higher Education.

1. **History and Development of Higher Education in South Africa.**—The first beginnings of a system of higher education in South Africa are to be found in the establishment of the South African College at Cape Town in 1829. It was not, however, until the passing of the University Act of 1873 by the Cape Parliament and the establishment of the University of the Cape of Good Hope that any notable advance was made.

A short summary of the history and development of the University of the Cape of Good Hope up to its dissolution in 1918 is contained in the first three issues of the *Year Book*. Statistics are also given therein as to the examinations conducted under that University.

2. **University of South Africa.**—(i) *General.*—The University of South Africa from the 2nd April, 1918, became the legal successor of the University of the Cape of Good Hope, the headquarters of which have been removed from Cape Town to Pretoria, and which embraces the following constituent colleges:—Grey University College, Bloemfontein; Huguenot University College, Wellington; Natal University College, Pietermaritzburg; Rhodes University College, Grahamstown; University College, Potchefstroom; and the Transvaal University College, Pretoria. In the case of each College there is a Governing Council responsible for general administration, and academic matters and discipline are controlled by the College Senate, consisting entirely or mainly of the Professors on the staff, the executive functions being discharged by the Registrar, or, in some cases, by the Rector or Master.

The government and executive authority of the University are vested in a Council, consisting of eight members appointed by the Governor-General, four members elected by Convocation, and one member appointed by the Council and one by the Senate of each constituent college. Provision is also made for the appointment of a representative of any Government or Administration outside the Union which contributes to the University such funds as may be presented by statute. The Council holds office for six years.

The University Senate consists of the heads of recognized departments of study at the constituent colleges, and controls the curricula, syllabuses of study and degree and diploma examinations of the University, subject to the authority of the Council.

There have also been established two bodies, one named the "Joint Matriculation Board," consisting of representatives of the four Universities (South Africa, Cape Town, Stellenbosch, and Witwatersrand), the Provincial and Union Education Departments, and of the teachers of public and private secondary schools, which is charged with the control and conduct of the matriculation examination, and the other named the "Joint Committee for Professional Examinations," for the control and conduct of the examinations in law (other than degree examinations), surveying, and the final examination for patent agents. The Registrar of the University of South Africa is *ex officio* Secretary to the Joint Matriculation Board and the Joint Committee for Professional Examinations. His address is P.O. Box 392, Pretoria.

OFFICERS OF THE UNIVERSITY OF SOUTH AFRICA.

Chancellor	Field-Marshall H.R.H. the Duke of Connaught and Strathearn, P.C., K.G., K.T., K.P.
Vice-Chancellor	Sir John E. Adamson, K.B., M.A., D.Lit.
Chairman of Senate	Professor P. J. du Toit, B.A., D.Med.Vet., Ph.D.
Deans of Faculties—	
Arts	Professor F. Postma, Litt.Dr.
Science	Professor R. B. Denison, M.A., D.Sc., Ph.D.
Law	Advocate F. B. Burchell, B.A., LL.B.
Agriculture	Professor J. C. Ross, B.A., M.Sc., Ph.D.
Commerce	Professor E. H. Brookes, M.A., D.Litt.
Veterinary Science	Professor Sir Arnold Theiler, K.C.M.G., D.Med.Vet., D.Sc.
Engineering	Professor J. H. Neal, A.R.C.Sc., A.M.I.Mech.E., A.M.I.C.E., A.F.Ae.S.
Registrar	C. C. Grant, M.B.E., M.A.
President of Convocation	Professor H. Reinink, Litt.Dr.

(ii) *Grey University College.*—The College was founded in 1855 by Sir George Grey but it was not until 1904 that the classes were organized in such a way as to permit of the separate constitution of a University College, which took place in 1907. The erection of the College buildings was completed in 1909, and in 1910 the University College was incorporated by statute. The work undertaken comprises the usual preparation for the examinations of the University of South Africa in literature and science, survey, education, and law, including preliminary classes for the study of medicine, engineering, agriculture, commerce, and theology.

The College has facilities for research in the departments of botany, chemistry, physics, geology, and zoology. The herbarium of the botany department is the regional herbarium for the Orange Free State and Basutoland and for the Union Botanical Survey.

(iii) *Huguenot University College.*—The College dates back to 1874, when, as the Huguenot Seminary, it was founded in Wellington by the late Rev. Andrew Murray, D.D. It was formally incorporated by Act of Parliament in 1907 as a College for women students (with the right of retaining male students for a limited period); and is named in the *University of South Africa Act*, 1916, as one of the constituent Colleges of the University. An amendment to the Charter in 1920 inserted the word "University" in the name of the College, and opened its doors to male students from Wellington district. Matriculated students are prepared for the B.A., B.Sc., M.A., and M.Sc. degrees of the University of South Africa and for the Higher Teachers', the Lower Secondary, and Domestic Science Diplomas of the University of South Africa. The College also gives a diploma in horticulture.

(iv) *Rhodes University College.*—The Rhodes University College was established in 1904, when it took over the college department of St. Andrew's College School, which had carried on university work in Grahamstown since 1878 with state-aided lecturers, who were transferred to the Rhodes College. A sum of £50,000 was set apart by the Rhodes Trustees towards the establishment of the College, augmented by £10,000 raised locally, and also by a bequest of £25,000 from the late Alfred Beit and £5,000 from the De Beers Company. Teaching is carried on temporarily in the Drostdy Buildings. Plans for the complete college building scheme have been prepared, and are being carried out as funds permit.

The College is a residential institution, and there are houses and dining halls for men and women students. Courses are given in all the usual arts and science subjects, as well as for the lower and higher diplomas in education, also the first year courses in engineering and medicine and first and second year commerce. Bursaries and scholarships are available.

Facilities exist for enabling students to acquire a practical knowledge of various sciences. Details of the work performed in a number of these were given in previous issues of this *Year Book.*

The Grahamstown School of Art has been taken over as a department of this College.

(v) *Transvaal University College.*—In 1908, university classes in arts, science, and law were established at Pretoria by the Transvaal Government, and were placed under the control of the Council of the Transvaal University College at Johannesburg, the constitution of that body being altered so as to give Pretoria equal representation. A separation took place in 1910, the Johannesburg section being re-incorporated as the South African School of Mines and Technology, whilst the Pretoria section retained the name of the Transvaal University College. In 1917 was instituted a Faculty of Agriculture, financial provision for which (an endowment of £100,000) had been made by the last Parliament of the Transvaal in 1910. The following faculties have since been established: 1918, Theology; 1919, Commerce and Public Administration; 1920, Veterinary Science; 1923, Music. The original college buildings were erected and equipped at a cost of £50,000; those of the Faculty of Agriculture at a cost of £100,000; while those of the Faculty of Veterinary Science, now in process of erection, involve an expenditure of £150,000. An administration block and additional science laboratories, costing £40,000, have been completed and occupied.

Courses are provided for all degrees and diplomas of the University of South Africa in arts, science, agriculture, veterinary science, law, divinity, education, music, commerce, and public administration.

The Faculty of Veterinary Science, under the headship of Sir Arnold Theiler, works in the closest co-operation with the Government Research Laboratories at Onderstepoort, and provides a five-year course leading to the degree of B.V.Sc., a feature being the training in Tropical Diseases. The Faculty of Agriculture, although not yet fully developed in all its branches, gives a four-year course leading to the degree of B.Sc. (Agric.), and provides as options an advanced technical training in most of the branches of agriculture practised in South Africa, such as horticulture, animal husbandry, dairying, agronomy, entomology, botany, and agricultural engineering.

Important research work has been done in various directions during recent years at this institution, which provides the necessary facilities to students and members of the staff.

(vi) *Natal University College.*—The College was incorporated by Act of the Natal Parliament of 1909, and teaching was started in 1910 in the Town Hall of Pietermaritzburg until the college buildings at Scottsville were erected in 1912, on a site of forty acres presented by the municipality for the purpose. The cost of the original buildings and equipment, amounting to about £60,000, was defrayed by the Government. Lately, additional buildings with equipment, including a women-students' hostel, have been provided at a cost of £37,000, met from Union loan funds. The teaching staff includes sixteen professors and seven lecturers.

In addition to the Pietermaritzburg establishment, classes for the commerce, engineering, and fine arts degrees are conducted at the Natal Technical College, Durban, under the direction of four professors and one lecturer.

(vii) *Potchefstroom University College.*—The Potchefstroom University College developed out of the literary department of the "Theologiese School van de Gereformeerde Kerk," which was founded the 29th November, 1869, at Burghersdorp, Cape Province, and solely supported by the Gereformeerde Kerk. In February, 1905, this school with its literary department was transferred to Potchefstroom. In April, 1919, a Government subsidy was granted to this literary department, whereby a complete separation took place between the two departments. The College was placed under the management of its own council under the present name. In June, 1921, the *Potchefstroom University College (Private) Act* was passed by Parliament. On the 6th July, 1921, it was incorporated, by proclamation, as a constituent college of the University of South Africa. The work undertaken comprises the preparation for the B.A., B.Sc., M.A., M.Sc., and B.D. examinations of the University of South Africa and the Transvaal teachers' examinations in co-operation with the local Normal College.

3. **University of Cape Town.**—The University of Cape Town was created in 1916 by an Act of Parliament which provided for the incorporation of the South African College (founded 1829, incorporated 1837) as a University on 2nd April, 1918 (see previous issues of this *Year Book*).

The University provides for the residence as well as the teaching of students, and confers degrees in the faculties of arts, science, engineering, law, commerce, music, education, and medicine, and diplomas and certificates in teaching, music, commerce, and public health. The degrees and diplomas of the Medical School are recognized for purposes of registration throughout the Union and Southern Rhodesia, and the degrees in law are accepted for admission to the bar. There is also attached to the University a school of African Life and Languages for the special study of native languages and customs. In 1922 the South African College of Music was amalgamated with the University as its department of music.

The first block of the new buildings which are to be erected for the University at Groote Schuur (in terms of its Act of Incorporation) was commenced in 1922.

In close proximity to the new University there is to be erected a public hospital of 800 beds, which will serve also as a clinic for the Medical School. The institution receives liberal support from the State, the Corporation of the City of Cape Town, and the Cape Divisional Council.

Provision is made for research work in the faculty of science, in civil, electrical, chemical and mechanical engineering, and in the faculty of medicine (anatomy, physiology, bacteriology, pathology, and pharmacology).

OFFICERS OF THE UNIVERSITY OF CAPE TOWN.

Visitor	His Excellency the Governor-General.
Chancellor	H.R.H. Edward, Prince of Wales, K.G., G.C.M.G., G.B.E., M.C.
Principal and Vice-Chancellor	Sir J. Carruthers Beattie, Kt., D.Sc., F.R.S.E. (Chairman of Senate).
Registrar	W. G. R. Murray, M.A.
President of Convocation	Advocate R. W. Close, K.C., B.A., LL.B., M.L.A.

4. **University of Stellenbosch.**—The Victoria College developed out of the Stellenbosch Gymnasium, which was founded in 1866, and in connection with which an Arts Department was established in 1874. An Act of incorporation was passed by Parliament in 1881.

By the *University of Stellenbosch Act*, passed by the Union Parliament in 1916, the College, on the 2nd April, 1918, was incorporated as the University of Stellenbosch, and in addition to fulfilling its previous functions is entitled to examine its own students and grant degrees. Provision is made for courses leading to degrees and diplomas in the

faculties of arts, science, agriculture, law, theology, education, and commerce. There are 37 professors, 28 lecturers, and 8 other teachers on the staff. The number of students in June, 1925, was 970, of which 460 were accommodated in University Hostels. A special feature of this University is its Faculty of Agriculture, which makes provision for the training of future farmers and agricultural experts, besides providing special courses in agriculture for teachers and courses in domestic science. Extension work is carried on by members of the faculty in collaboration with the Department of Agriculture.

Research work is undertaken in practically every department of study at the University, including education, psychology, literature, geography and history (in the latter cases particularly from the South African economic standpoint). In 1923 the University commenced the publication of the results of scientific investigations undertaken in different branches of study by members of the teaching staff, under the title of *Annals of the University of Stellenbosch—Annale van die Uniwersiteit van Stellenbosch.*

OFFICERS OF THE UNIVERSITY OF STELLENBOSCH.

Chancellor	The Rev. Professor P. G. J. de Vos, D.Litt.
Vice-Chancellor	The Rev. Professor A. Moorrees, Litt.D.
President of Convocation	S. F. N. Gie, B.A., Ph.D.
Chairman of Senate	S. F. N. Gie, B.A., Ph.D.
Registrar	D. J. Kriel, B.A.

5. **University of the Witwatersrand.**—This institution has developed out of the South African School of Mines at Kimberley, which was transferred to Johannesburg in 1903 under the name of the Transvaal Technical Institute. In 1906 it was renamed the Transvaal University College, and in 1908 took over the arts and science classes which had been established in Pretoria. In 1910 a further change took place, the Pretoria classes being incorporated as a separate body which retained the title of Transvaal University College, the Johannesburg institution receiving the name of South African School of Mines and Technology, and being restricted to the departments of applied science and technology. During the year 1916 arts and science departments were organized in order to enable the institution to participate fully as a constituent College of the new University of South Africa. On the 20th September, 1920, the name of the South African School of Mines and Technology was changed to University College, Johannesburg. In 1921 Parliament passed the *University of the Witwatersrand, Johannesburg* (*Private*) *Act*, incorporating the College as a University, with effect from 1st March, 1922. The University has faculties of arts, science, medicine (including dentistry), commerce, engineering (including mining and metallurgy, mechanical and electrical engineering, civil engineering, chemical technology, and architecture) and law. There are also departments of education, music, Bantu studies, and actuarial mathematics.

A considerable amount of original research work has been carried out at the University, especially in the departments of metallurgy and geology; in the latter, the composition and origin of the auriferous conglomerates of the Witwatersrand have been investigated, and miscellaneous research has been done in mineralogy and petrology. In the department of philosophy an educational survey of the schools of the Rand area by means of Intelligence Tests was undertaken during 1924 and 1925, with the co-operation of the Witwatersrand Council of Education and the Transvaal Education Department. Ample facilities exist for research in mechanical engineering, zoology, botany, physics, and all the departments of the faculty of medicine, and a considerable amount of work has been done in each of these departments. In the departments of chemistry and analytical and research chemistry, special laboratories have been equipped for research purposes. The erection of the new buildings at Milner Park is proceeding, and nearly all the departments, thoroughly equipped, have already moved in.

OFFICERS OF THE UNIVERSITY OF THE WITWATERSRAND, JOHANNESBURG.

Chancellor	H.R.H. Prince Arthur of Connaught, K.G., K.T., K.P.
Vice-Chancellor	Sir Robert Kotzé, Kt., B.A.
Chairman of the Council	Sir W. Dalrymple, K.B.E.
Principal	Sir Wm. Thomson, Kt., M.A., B.Sc., LL.D., F.R.S.E.
President of Convocation	Professor C. M. Drennan, M.A.
Registrar	H. W. J. van der Brugge, M.A., LL.B., J.P.

6. **Statistics of Teaching Universities and University Colleges.**—The tables hereunder give (i) comparative statistics of Higher Education from the year 1910, and (ii) in respect of each Teaching University and College the dates of foundation and incorporation, the number of Professors, Lecturers, and Assistants, the number of Students in 1924 and the expenditure for that year; also the annual value of bursaries granted by the College.

(i) STATISTICS OF HIGHER EDUCATION IN THE UNION, 1910 TO 1924.

* As the South African College. Constituted the University of Cape Town on the 2nd April, 1918.
† As the Victoria College. Constituted the University of Stellenbosch on 2nd April, 1918.
‡ As the University College, Johannesburg. Constituted the University of the Witwatersrand on the 1st March, 1922.
§ On the dissolution of the University of the Cape of Good Hope (founded 1873).
‖ Includes 515 music students.

7. **Examinations under the New University Organization.**—The examining bodies created under the new University system in the Union are the Universities of South Africa, Cape Town, Stellenbosch, and the Witwatersrand, the Joint Matriculation Board, and the Joint Committee for professional examinations. The results of the examinations conducted by these bodies during the year 1924 are given in the following tables :—

* Complete Examination.

† In addition there were 1,201 candidates for the Transvaal Secondary School Certificate Examination (Stage II), of whom 54·7 per cent. passed, and 567 candidates for the Cape Departmental Secondary School Senior Certificate, of whom 70 per cent. passed. These examinations are recognized as equivalent to the Matriculation Examination for purposes of exemption therefrom.

9. **Extension Facilities at University Institutions.**—*The University of Cape Town* instituted in 1921 a course of extension lectures in various towns of the Cape Province. Lectures by members of the teaching staff of the University have been given, by invitation, at various towns as far as Kimberley, on subjects selected by a committee in each of the towns visited. In addition to these lectures outside the Cape Peninsula, courses open to the public, apart from the ordinary degree courses, have been given at the University. For some years past there has been a course of popular lectures on the motor-car, the subject matter of the lectures being suitable for owner-drivers having no knowledge of motor-car engineering. Special courses of public lectures have been given during recent sessions on aeronautics, aesthetics, irrigation, and other subjects. In 1923 and 1924 the University provided vacation courses of lectures on African life and languages, specially arranged for missionaries, magistrates, native commissioners, and others whose vocation brings them into immediate contact with natives. During the summer vacations, courses primarily for secondary school teachers have been given from time to time on subjects suitable for school purposes, and these attract teachers from various parts of the Union; lectures for teachers n schools in the Cape Peninsula were also given during the University sessions 1920 and 1921. In 1924 and 1925 public lectures on educational problems were given at the University by Dr. Casimir and Sir John Adams. At *the University of Stellenbosch* extension lectures are given each year by members of the teaching staff, and in 1924 five series of these lectures were provided. In addition, ten lectures on various subjects were given by members of the staff at different places in the Union. The *University of the Witwatersrand* conducts afternoon and evening classes of a post-matriculation standard, mainly attended by teachers, in subjects in the faculties of arts and science; by attendance at such classes it is possible to qualify for the degree of Bachelor of Arts. Public lectures are given by members of the staff from time to time at the University, and are well attended by the public. The University is in touch with the Workers' Educational Association, and during 1922 and 1923 a discussion class was conducted with an attendance of about thirty, while in 1924 a course of lectures on "The New Psychology" showed a very large attendance. During the September vacations in 1921–24 "Refresher" courses for teachers were conducted at the University, at which short courses of lectures were given in English, history, geography, mathematics, psychology, music, animal biology, anthropology, etc. During the June vacations of 1924 and 1925, the University conducted courses in African native studies, in which lectures were given in native law and administration, philology, phonetics, witchcraft, history of native policy, music, anthropology, native economics, the social systems of the Bantu, and the psychology of primitive peoples. This aspect of the University's work shows promise of rapid and continuous development. In January, 1925, the University, through the co-operation of the Rand Mines, arranged a vacation course in mine hygiene for medical students, medical graduates, compound managers, underground officials, and any others associated with or interested in the welfare and safety of Europeans and natives in the Witwatersrand mining area. Evening classes in technical and allied subjects which were hitherto conducted by the University for the benefit of apprentices and others, have been placed under the control of the Witwatersrand Technical Institute. At the *Transvaal University College*, Pretoria, the extra-mural classes given out of office hours and in the business centre of the town provide facilities for civil servants, professional and business men to qualify for degrees in commerce, public administration, and law. In addition, a large number of public lectures, dealing mainly with problems of the day, are regularly given in Pretoria and elsewhere by members of the teaching staff and other authorities under the aegis of the College. At the *Huguenot University College*, Wellington, extension courses in chemistry and agriculture are given, on request, to farmers of the district. At *Rhodes University College*, Grahamstown, extension lectures are given from time to time by various members of the staff.

§ 2. State and State-aided Education other than Higher Education.

1. **General.**—Under the *South Africa Act*, for a period of five years after the establishment of the Union and thereafter subject to decree of Parliament, control of education other than higher education was granted to the four Provincial Administrations. This arrangement still obtains, and as the result each Province has continued to follow its own system and to shape its development according to its own separate policy. Thus four systems of state or state-aided education exist, which though akin in some respects are entirely dissimilar in others. Further there are in the Union numbers of schools independent of state aid or state control, statistics relating to which are given in § 4 of this chapter. The information contained in this section relates entirely to education under public control.

The whole question of "Provincial" education has been the subject of investigation by various Government commissions. The Provincial Finances Commission, which was appointed in September, 1922, and reported in April, 1923, inquired into the financial aspects of the question, and the Education Administration Commission, appointed in August, 1923, made a survey of the whole field of state and aided education in the Union (other than higher education). In its first report, dated October, 1923, the Commission

made recommendations defining the limits of compulsory education and assigning the burden of costs in relation to such limits. The final report, published in June, 1924, dealt more particularly with the questions of rural and technical education, and made proposals for the co-ordination of educational effort in the Union by the establishment of a central Board of Education directly under the control of the Union Government.

As from the 1st April, 1925, all Industrial and Trade Schools, formerly under the administration of the Provinces, were taken over by the Union Education Department and classified under Higher Education.

2. **Administrative System.**—Subject to final control by the Provincial Administration, the central direction of public education in each Province is exercised by the Provincial Education Department, the permanent head of which in the Cape of Good Hope is the Superintendent-General, in Natal the Superintendent, in the Transvaal and the Orange Free State in each case the Director. Each Province has an inspection staff adapted to its requirements (see previous issues of this *Year Book*).

In the *Cape of Good Hope* the majority of schools for European pupils are controlled by 123 school boards with statutory powers. Schools for non-European pupils are mostly controlled by denominational bodies. The general policy of the Cape Education Department aims at the encouragement of local efforts for the extension and improvement of primary and secondary education for all races. The various Acts and Ordinances dealing with education in this Province have been co-ordinated in the *Consolidated Education Ordinance*, 1921.

In *Natal* the Department has power to establish and maintain primary schools, and also to make grants-in-aid to private schools. It has direct management of certain secondary schools, and the power to make grants to other secondary schools which agree to maintain the same standard of education as in the Government schools. The Department may establish schools for native children, and, on request, it may undertake the inspection of private schools. There is no system of local administration, but advisory school committees exist in some districts.

In the *Transvaal*, primary education is compulsory, and both primary and secondary education are free, while books and school material are provided by the Provincial Administration. The establishment and maintenance of schools for European children form the bulk of the Education Department's work, but it also has power to establish schools for non-European pupils. Grants-in-aid are made to private farm schools and various other institutions which do not form part of the ordinary school system. The Province is divided into thirty-two school districts, for each of which there is an advisory body called a school board, consisting partly of elected and partly of nominated members.

In the *Orange Free State*, the Department has powers to establish and maintain various types of public schools and allied institutions, and also to make grants-in-aid to the latter, as well as to private schools which comply with certain conditions. The Province is divided into fifty-seven school districts, for each of which there is an advisory board, consisting of elected members, with certain powers of supervision.

Further particulars of the educational administrative systems of the various Provinces, both central and local, are given in the sixth and previous issues of this *Year Book*.

3. **Finance.**—The central expenditure on school education is met from grants made by Provincial Councils supplemented from certain other local sources of revenue. In the *Cape of Good Hope*, expenditure on teachers' salaries, hire of buildings, purchase of equipment, etc., is defrayed almost entirely from Provincial Revenue Funds, the payment of school fees up to and including Standard VI having been abolished as from the 1st July, 1920, in the case of all schools, European and non-European, except in certain high schools and in a few primary schools connected with high schools. In *Natal* the entire cost is paid out of the central fund, receipts from school fees being paid into the credit of that fund. Local contributions are not required by the Administration. Primary Education is entirely free in Government Schools. In the *Transvaal* school education is free, the whole cost being met from the Provincial revenue. In the *Orange Free State* the total expenditure is similarly met. No local contributions towards expenditure are required. Education up to and including the matriculation standard was made free in 1920; but certain schools approved of by the Provincial Administration are allowed to charge tuition fees, the amount of such fees being placed at the disposal of the respective school committees for expenditure at their discretion for the benefit of the school.

A feature of the financial provision made in the various Provinces for the encouragement of education is the bursary system (see page 185).

4. **Classification and Curriculum of Schools.**—(i) *Cape of Good Hope.*—European schools are classified as training colleges, training schools, high schools, secondary schools, primary schools, farm schools, special schools, and part-time schools.

There are 105 high schools and 84 secondary schools providing differentiated courses in secondary education. There are 1,802 primary schools in which instruction is given on the lines of the complete primary school course, consisting of two sub-standards and six standards. Farm schools, of which there are 371, provide instruction on the lines of

the primary course at centres where it is not possible to secure a regular attendance of at least ten pupils, the minimum requirement for primary schools.

The native section includes 1 secondary school, 1 primary school, 4 part-time schools, 9 industrial schools, 14 training schools, and 1,575 native schools. The coloured section includes 2 intermediate schools, 17 primary schools, 4 part-time schools, 4 training schools, and 424 coloured schools. The native and coloured schools are managed by the various religious denominations, and are aided by the Government.

(ii) *Natal.*—The Government schools are divided into primary schools, higher grade elementary, and secondary schools; the former covering a syllabus of six standards. No free scholars are admitted to the high schools except those who gain "freeplaces" under the bursary system, or the dependents of those who went on active service. No native, Indian, or coloured children are allowed in schools other than those specially provided for them. Farm schools may hardly be said to be schools in the ordinary sense, but merely groups of children under a tutor or governess. Separate syllabus arrangements exist for all classes of schools, and also for schools where Dutch is the mother tongue of the children.

(iii) *Transvaal.*—Primary schools cover a course of six standards. A seventh has been approved in certain cases. Secondary or high schools have in five cases complete and separate primary departments and in a few cases have preparatory classes corresponding to Standards IV and V, before the ordinary high school course which commences with Standard VI as the first of the five forms provided for in the curriculum. There are 45 high schools in the Province, 3 being for a commercial and 1 for a technical education and 1 for the preliminary training of teachers. Of these, 7 are for boys only, 5 for girls only, and 33 for both boys and girls. On the 28th November, 1924, there were 8,846 pupils in these schools, while 594 pupils were receiving the higher education in the secondary departments of primary schools. Marked progress is being made in the various subjects classified under the head of domestic science, and also in manual training, elementary science, and technical and trades education. Specially qualified instructors are provided for these subjects.

(iv) *Orange Free State.*—Primary schools provide for the whole primary school course from the sub-standards to standard VI inclusive. Intermediate schools provide for continuation work up to the school leaving certificate and including the National Commercial certificates of the Union Education Department. Secondary schools, in addition, provide for courses up to matriculation and equivalent examinations. Thus two types of school may be combined in one institution. The public school is regarded as complete when it covers the whole ground from the infant school to University matriculation.

5. **Religious Instruction.**—The practice in each Province in all public schools is for school to be opened with prayer and the reading of the Bible. Teaching of Bible history in school, subject to a conscience clause, may be and generally is provided; but no sectarian or doctrinal teaching is allowed, except in the Cape Province under certain conditions laid down in the *Religious Instruction in Schools Ordinance*, 1913, which governs the matter.

6. **Attendance.**—(i) *Cape of Good Hope.*—Education for European children between the ages of seven and sixteen years is compulsory throughout the Province unless the child is engaged in a regular occupation and has already passed the sixth standard. Provision is made for the transport or boarding of children when necessary. Primary Education up to and including Standard VI is free, except in certain high schools and a few primary schools connected with high schools.

(ii) *Natal.*—Education for European children between the ages of seven and fifteen years is compulsory. Fees are charged in primary schools only in respect of pupils who have passed Standard VI and are engaged in vocational work.

(iii) *Transvaal.*—Education in respect of white children between the ages of seven and fifteen years is compulsory. Education is free.

(iv) *Orange Free State.*—Education in respect of white children between the ages of seven and sixteen years is compulsory, unless a child is receiving adequate instruction elsewhere, or has passed the sixth standard and is in regular employment. If a pupil resides more than three miles from school and if the parent is unable to provide transport, the Department gives assistance, either for transport or for board.

7. **Qualifications and Grading of Teachers.**—(i) *Cape of Good Hope.*—The chief classes of certificates issued by the Department to student-teachers after training and examination are :—

(*a*) Primary Teachers' Lower Certificate [formerly called Third Class Teachers' Certificate (Senior)], after a two-year course of training, the admission standard being a pass in the Junior Certificate examination. There are also a Coloured Teachers' Primary Lower Certificate and a Native Teachers' Primary Lower Certificate. The courses of training extend over a period of three years, the standard of admission being a pass in Standard VI.

(*b*) Primary Teachers' Higher Certificate (formerly called Second Class Teachers' Certificate), after a two-year course of training, the admission standard being a pass in the Senior Certificate or Matriculation examination. There are also a

Coloured Teachers' Primary Higher Certificate and a Native Teachers' Primary Higher Certificate. The courses of training extend over a period of two years, the standard of admission being a pass in the Junior Certificate examination.

(*c*) Infant School Teachers' Certificate, after a training course of one year each, the admission requirement being the possession of the Primary Teachers' Lower Certificate.
(*d*) Teachers' Drawing Certificate, awarded to candidates who obtain first-grade Certificates in Freehand, Model, Geometrical, and Blackboard Drawing.
(*e*) Art Teachers' Certificate, awarded to candidates holding the last-mentioned certificate, who complete a further course of study within five years.
(*f*) Teachers' Woodwork and Cardboard Modelling Certificate.

Teachers in ordinary coloured or native mission schools are eligible for a Good Service Allowance after five years' reasonably meritorious and continuous teaching service, and pensions based on this allowance are provided for. Teachers in School Board schools are graded and paid according to the nature of the work on which they are employed, qualifications and experience being taken into account; Good Service Allowance is not being continued in the case of these teachers and certain other teachers, for whom a new pension scheme has been laid down. The pension contribution amounts to 4 per cent. on the annual salary.

(ii) *Natal.*—Two classes of certificates are given on examination. The Government, Training College at Pietermaritzburg supplies about fifty certificated teachers each year, 80 per cent. of whom are women. Admission to the Training College is gained either by means of an entrance examination or by means of the University Matriculation examination. Students in training have several avenues of qualification offered them. First, the purely internal Third Class Certificate, for which a two years' course is required. In conjunction with the Natal University College the Teachers' Lower Diploma (three years' course to which the Matriculation Certificate admits), the Higher Diploma (four years' course), and the M.Ed. degree (five years' course) may also be taken at this institution.

The Second Class Teachers' Certificate is at present an extra-mural course for practising Third Class teachers who desire a higher qualification, or for unqualified practising teachers who must have academic qualifications not less than the Intermediate Arts Examination of a university of standing, or (for women) the L.L.A. diploma of St. Andrew's University. A women's hostel has been established. Senior and junior certificates are given to Indian teachers, and there are three native teachers' certificates. A few teachers in Government schools are public servants and entitled to pensions. Others contribute to a superannuation fund.

(iii) *Transvaal.*—Teachers in schools directly maintained by the Government are public servants. They enter into a definite contract with the Government. A teacher's salary depends on the qualifications held. All teaching posts are graded in accordance with these qualifications, and the complete list of the posts, together with the qualifications required for each, are laid down in the conditions of service. The main lines of classification depend upon certification, training, and experience.

Teachers' Certificates of the Third and Second Class are issued by the Transvaal Education Department, which prescribes the conditions under which they may be issued. Courses for both classes of certificate are provided at the normal colleges, and teachers may also prepare for them privately. The First Class Certificate is issued by the Union Department of Education, which prescribes the conditions under which it may be issued. The university colleges provide courses, usually directed by a professor of education, for this certificate.

A Provisional Certificate of the Third Class, which is really a licence to teach and is not a guarantee of training or study for the profession of teaching, is issued to teachers who have not qualified for an unprovisional certificate. This is done to fulfil a requirement of the law.

(iv) *Orange Free State.*—Teachers in public schools are mainly servants of the State. The minimum requirement for recognition as a teacher in public schools is the successful completion of a secondary school course. The examinations and grading of teachers in the service of the Department are conducted by a Board of Examiners, of which body the Director of Education is *ex officio* Chairman. Professional Teachers' Certificates are of eight classes—Lower Primary Teachers' Certificate, Higher Primary Teachers' Certificate, Advanced Primary Teachers' Certificate, Commercial Teachers' Certificate, Domestic Science Teachers' Certificate, and Secondary Teachers' Certificates, Grades I, II, and III. The minimum requirements for the admission of candidates to these examinations are as follows:—Lower Primary Teachers' Certificate (women only): Matriculation or equivalent certificate and one year's course of training at the Normal College; Higher Primary Teachers' Certificate (men and women): First year's B.A. course in certain specified subjects and one year's training at the Normal College (for this certificate teachers may specialize in kindergarten and infant work); Advanced Primary Teachers' Certificate: Higher Primary

Teachers' Certificate or equivalent, second year's Degree course and five years' experience (if the Degree course was taken as an internal student the experience required is reduced to two years); Commercial Teachers' Certificate: First year's Bachelor of Commerce course in certain specified subjects and an approved course in shorthand, one year's professional training at an approved institution; Domestic Science Teachers' Certificate; Matriculation or equivalent certificate, and two years' training in domestic science subjects at an approved institution.

The Secondary Teachers' Certificate is issued without further examination as follows:—

Grade I.—To graduates in possession of the Provisional T.1 Certificate of the Union Education Department.

Grade II.—To graduates in possession of the Advanced Primary Certificate or T.2 Certificate under previous laws.

Grade III.—To graduates in possession of the Higher Primary Certificate or T.3 Certificate under previous laws.

8. **Salaries of Teachers.**—Particulars are given in the sixth issue of this *Year Book* as to the scales of salaries obtaining with regard to various classes and grades of teachers in each Province. No changes have been recorded in these scales, except that in the Orange Free State the minimum salaries in Classes III and IV were reduced by £20 or £30, and the salaries in Classes V to IX (uncertificated teachers) by amounts ranging from £50 to £24.

9. **Training Colleges.**—In the *Cape of Good Hope*, apart from the Universities, there are twelve European training colleges and schools in which there are over 1,100 students under training as teachers. In *Natal* there is one Government Training College which is situated at Pietermaritzburg, and provides (*a*) a two years' course to the Third Class Certificate of the Province after admission through the training College entrance or matriculation examination, (*b*) a Higher or Lower Diploma Course in Education, (*c*) the M.Ed. degree. The College contains in its own grounds classrooms, laboratories, an art school, music rooms, a domestic science building, and a women's hostel. The following table gives the list of training colleges and training schools for teachers in each Province of the Union:—

Cape of Good Hope:

European.

Cape Town Training College.
Cradock Training College.
Graaff-Reinet Training College.
Grahamstown Training College.
Kimberley Training College.
King William's Town Training School.
Oudtshoorn Training School.
Paarl Training College.
Stellenbosch Training School.
Steynsburg Training School.
Uitenhage Training School.
Wellington Training College.

Non-European.

In the native training schools over 1,500 students are under training as teachers, and in the coloured training schools over 300.

10. **Special and Part-time Schools.**—In the *Cape of Good Hope*, the European special schools already referred to include three art schools, three schools for deaf mutes, and one school for the blind, twelve industrial schools (including four single-teacher industrial departments attached to indigent boarding-houses) for boys and five (including one single-teacher industrial department attached to an indigent boarding-house) for girls. In the industrial schools trades are taught to the children of parents who are in poor circumstances. The trades taught to boys are wagon-making, carpentry, blacksmith's work, tailoring, shoemaking, printing, bookbinding, gardening, and agriculture, and motor mechanics. Girls receive instruction in cooking, housework, and laundry work. Part-time schools, of which there are thirteen for European pupils are mainly evening schools which provide instruction in the subjects of the primary and secondary school course to pupils exempt under the law from compulsory attendance at a day school and otherwise occupied during the day. They include technical classes at the large centres. In *Natal*, amongst special schools are the Technical Institute at Pietermaritzburg, and the Natal Technical College at Durban. The Pietermaritzburg Technical Institute provides day, afternoon, and evening classes in engineering, commerce, mathematics, science, machine design and drawing, dressmaking, and telegraphy. Evening continuation classes are also held. The Natal Technical College includes a Technical High School with a four years' course, a School of Art, and courses in mechanical and civil engineering, mathematics, physics, and electrical engineering, chemistry, and natural science, commerce, humanities, domestic science, and sociology; and provision is made for evening classes and day classes for apprentices and engineering students.* The School of Physical Culture at Pietermaritzburg comprises a general course in physical development for children and adults. The Farm Training School at Weston was opened in 1914, and there are in residence over 100 boys between the ages of thirteen and nineteen years. Provision is made for a three years' course in agriculture and wood and iron work. These institutions are now under the control of the Union Education Department. In the *Transvaal*, there is a technical high school at Johannesburg, and there are three technical or trade schools, maintained by Government. There are also two industrial schools aided by Government. In addition, there were at the end of 1924 forty-three continuation or evening class centres in operation with an enrolment of 4,435 students. In the *Orange Free State* there are several Trade and Industrial Schools, including schools of agriculture and housewifery, and continuation classes are also conducted in different centres of the Province.

11. **Vocational Education.**—Under the supervision of the Union Department of Education a series of national technical and commercial examinations is held at regular intervals with the object of stimulating vocational education in combination with or in continuation of the ordinary school curriculum. The Department is assisted by an advisory committee representative of the Provincial Education Departments, the Universities, the Chambers of Commerce, and various technical institutions, and is able, through the advisory committee and by setting a proper standard for the departmental examinations, to ensure that the training obtained by students and the certificates issued on the examinations are of definite practical value. The examinations, which are held in over 179 centres, and for which 6,023 candidates entered in 1924, are of five general types: (i) Teachers' Certificates and Diplomas (embracing courses in domestic science, commerce, technology and art); (ii) National and Advanced Technical Certificates; (iii) National Housewife Certificates; (iv) National Technical Day-School Certificates (in which technical courses are associated with subjects of a more academic character), and (v) General Commercial Certificates.

The Union Department of Education is responsible for the maintenance of all industrial and trades schools in the Union, those formerly under the control of the Provincial Administrations having been taken over as from the 1st April, 1925. In the industrial schools, administered under the Children's Protection Act (see Chapter VIII), provision is made for training in agriculture and various trades. These latter schools, nine in number, are established at George, Paarl, and King William's Town in the Cape Province, Heidelberg and Standerton in the Transvaal, and Dewetsdorp and Tempe in the Orange Free State.

§ 3. Statistics of State and State-Aided Education other than Higher Education.

1. **General.**—The following tables give in respect of the Union, and of each Province separately, summarized figures indicating the development of primary and secondary education and education other than higher education from the earliest date available in each case to 1923.† The figures given as to expenditure relate only to expenditure from

* Under the *Higher Education Act* of 1923, the Natal Technical College was declared to be a place of higher education, and it became eligible for the receipt of grants-in-aid from the Union Government. Similar provision was made for the Cape Technical College, which has taken over the work hitherto done by the Salt River Technical Institute. These arrangements were designed to promote technical education in the two Provinces.

† Fuller historical tables will be found in previous issues of this *Year Book* (Nos. 2 to 6).

Government funds and do not represent the total cost of education, part of which in the Cape, Natal, and Orange Free State Provinces, and during some period to a limited extent in the Transvaal Province, has been defrayed from local sources. The figures showing expenditure per scholar are based upon the total of all scholars, European and non-European. Seeing that the cost of European and non-European education differs very considerably, and the proportion of European to non-European children varies in the case of each Province, comparison between the Provinces cannot be made with any degree of accuracy. For the purposes of comparison with the statistics which follow, it has been estimated that in the last quarter of the undermentioned years the numbers of European children in the Union over the age of seven and under the age of sixteen years (i.e. roughly the school-going period) were as shown :—

1921	334,426
1922	338,500
1923	338,575
1924	339,322
1925	339,777

* Excluding training departments connected with Universities and University Colleges.
† In addition, 26 part-time students attended various courses during the fourth quarter.
‡ There is, in addition, a visiting teaching staff of two males and two females.

(xi) TECHNICAL AND SPECIAL SCHOOLS, CAPE OF GOOD HOPE, NATAL, AND TRANSVAAL PROVINCES, 1923.

(*a*) CAPE OF GOOD HOPE.

Technical Schools.—Instruction in courses of Technical work is given at three centres, viz.: East London Technical Evening School, 122 students; Kimberley School of Mines 159 students; and Uitenhage Technical Evening School, 69 students.

Art Schools.—There were 316 students in attendance at the Cape Town, Grahamstown, and Port Elizabeth Art Schools.

The College of Music, Cape Town, had an enrolment of 536 students.

Domestic Science.—Training in the full range of domestic science work is given at the Cape Town Domestic Science Training Centre (41 Roeland Street), where, in addition to training Domestic Science teachers, instruction is given to 28 students in one or more subjects.

Vocational Schools.—There were 12 Industrial or Vocational Schools for European boys, viz., at Adelaide, Cape Town (Salesian Institute), Goedemoed, Karreedouw, Knysna, Lady Grey, Montagu, Oudtshoorn, Ugie, Uitenhage, Willowmore, and Worcester, with staff of 40 teachers giving instruction to 534 pupils in carpentry work, blacksmith work, bookbinding, gardening, printing, shoemaking, tailoring, wagon-making, and motor mechanics.

There were 5 Industrial or Vocational schools for European girls, viz., Adelaide, Riebeek West, Tulbagh, Ugie, and Wellington with staff of 14 teachers giving instruction to 167 girls in cookery, housework, laundrywork, etc.

Schools for Defectives.—There were 4 institutions for the deaf, dumb, and blind, viz., Cape Town Deaf and Dumb School, King William's Town Convent School for Deaf, Worcester Blind, and Worcester Deaf and Dumb School, employing 21 teachers, and attended by 122 European boys, 100 European girls, 7 non-European boys, and 5 non-European girls.

(iii) STATE EXPENDITURE ON SCHOOL BUILDINGS AND GROUND, AND NUMBER OF SCHOOL PLACES PROVIDED FOR EUROPEAN SCHOLARS IN EACH PROVINCE, 1923.

Description.	Cape of Good Hope.	Natal.	Transvaal.	Orange Free State.	Union.
Capital value of school buildings to date..£	2,775,097	1,079,060	2,712,151	1,157,694	7,724,002
Expenditure from loans during year.....£	104,551	18,510	170,417	66,127	359,605
Payments on loan interest and redemption during the year.....£	99,410	31,403	91,727	45,755	268,295
Additional number of school places provided during the year.....No.	*	1,072	4,437	*	—
Additional number of places in hostels provided during the year.....No.	*	—	190	*	—

* Not available.

(iv) *Bursaries Granted during the Year* 1923.—(*a*) *Cape of Good Hope.*—The number of bursaries granted for general educational purposes during the year was 14, involving an expenditure of £140. These bursaries are awarded to specially meritorious candidates for the Secondary School Junior Certificate Examination. In connexion with secondary education, 1,448 bursaries, to the value of £19,725 were granted, involving boarders, and 57, to the value of £288, involving transport.

(*b*) *Natal.*—In the Natal Province the number of bursaries granted for educational purposes and to boarders during the year was 265, reflecting an expenditure of £2,316. These bursaries represented free places, i.e. free books and tuition, and any computation of the amount expended would be impracticable.

(*c*) *Transvaal.*—The number of bursaries issued in the Transvaal for general educational purposes was 598, representing an expenditure of £6,410. Transport bursaries totalled 9,385 to the value of £11,787. Bursaries granted to boarders numbered 8,416, the resulting expenditure amounting to £182,769.

(*d*) *Orange Free State.*—The following figures relate to bursaries granted in the Orange Free State: For general educational purposes, 691, to the value of £9,714; for boarders, 403, to the value of £2,105; and for transport 53, to the value of £139.

4. **Statistics of Education of European Scholars in certain Urban Areas.**—The following tables give in summary particulars as to schools for European scholars in certain of the more important towns and urban areas in the Union :—

(i) EDUCATION OTHER THAN HIGHER EDUCATION OF EUROPEAN SCHOLARS—NUMBER OF STATE AND STATE-AIDED SCHOOLS IN CERTAIN URBAN AREAS, 1923.

* Including Scholars in Evening Schools in the Cape of Good Hope and Transvaal.

5. Statistics as to Education of Non-European Scholars.—The following tables give such statistics as are available in respect of State and State-aided education of non-European scholars. Particulars as to expenditure are only approximate, as an arbitrary line of allocation has been taken in respect of certain items of expenditure incurred by the Provincial Education Departments.

In the Orange Free State an amount is provided annually as a grant in aid of secular education of natives. This is paid as an out-and-out grant to religious denominations conducting mission schools, and is allocated in proportion to the numbers attending the schools. An exception is made in the case of Waaihoek Evening Classes (Waaihoek Location, Bloemfontein), to which a fixed amount of £36 is paid annually. This grant came into force in 1902–03. For that financial year it amounted to £2,000. For 1903–04 and 1904–05 it was reduced to £1,500. In 1905–06 it was £1,700. From 1906–07 to 1909–10 it was £2,000. In 1910–11 it was fixed at £4,000, at which figure it still stands.

STATE AND STATE-AIDED SCHOOLS FOR NON-EUROPEAN SCHOLARS.

Expenditure per scholar.....	£2. 15s. 1d.	£2. 9s. 1d.	£2. 2s. 7d.	18s. 10d.	£2. 10s. 1d.

* Represents total expenditure on non-European scholars, including Central Administration and Inspection.

§ 4. Statistics of Private Schools.

There is very little Government regulation of the activities of private schools in the Union. In *Natal*, the Education Department may make grants-in-aid to such schools, including contributions to the salaries of teachers, the purchase of books and equipment, and the cost of sites and buildings. The Department also undertakes, upon request, the inspection of private schools. In the *Transvaal*, the Department has a limited inspectorial power over private schools, which, if attended by ten or more pupils, are required to register and supply returns. In the *Orange Free State*, capitation grants may be made to private schools under conditions laid down in the Education Ordinance. Inspectors of the Department may visit and inspect any private school which is attended by five or more pupils, and the Administrator, on the advice of the Director of Education, may require any alterations in the conduct of the school to be made within a fixed time, and, if the order is not complied with, he may cause such school to be closed forthwith, and the pupils transferred to another school. All private schools must register and supply returns to the Department.

The figures given in the following tables are derived from returns furnished under regulations framed under section 10 of the Statistics Act, No. 38 of 1914, with relation to every school or other educational or training institution in the Union which was not maintained by the Government, was not in receipt of any Government grant, and in which not less than five pupils received instruction other than religious instruction during the calendar year.

§ 5. Medical Inspection of Schools.

(i) *Cape Province.*—Medical Inspection in the Schools of the Cape Province began in 1918 with the appointment of Dr. Karl Bremer. He carried on the work single-handed till 1919, and on his resignation, Dr. Leipoldt of the Transvaal School Medical Service, was seconded to the Cape Province for seven months. He recommended as a first step the appointment of two medical inspectors and four nurses. Dr. Maughan Brown and Dr. Elsie Chubb were appointed as medical inspectors, and Mrs. Davies as head of the school nursing service. Three assistant nurses were appointed in 1920, and since that time the staff has not been increased.

The Cape Province has an area of roughly 300,000 square miles, and a European school population of more than 125,000 children, many of whom live in scattered or thinly populated districts which are far from main roads or railways. It is impossible with the present staff to arrange for regular visits to all the schools under the Department, and with a few exceptions visits have had to be limited to schools under school boards of about 100 enrolment. This is not because the smaller schools do not require visiting—they are most anxious to have inspections—but with so small a staff it is essential to do as much actual inspection as can be got into the time. Days spent in travelling to small and distant schools much reduce the number of children who can be inspected in a year.

The method at present adopted is to inspect certain age groups each year, that is, all children born in certain years are inspected at each visit. These years are so chosen that children of 7–8 years and children of 14–15 years are inspected at a visit, that is, children just entering on their school life, and those nearing its end. This ensures that each child is seen twice during its school course. In addition to these age groups, cases specially selected by the teachers are inspected, and those children found to require medical treatment at the last visit are reinspected to see if defects have been remedied.

Parents are notified of the time of inspection, and are invited to be present. It is possible to do much educative and preventive work if the medical inspector can discuss the child with the parent. It is to be noted that the country parent often takes considerable trouble to attend the inspection of his children. The medical inspector has legal authority to inspect any child in school, and this power has been used in cases where there was a suspicion of infectious disease, or any other urgent reason for the inspection. At the beginning of inspection about 3 per cent. of parents lodged objections; the number is now under 1 per cent., and most of these are withdrawn when the parent is told that every child is inspected in turn, and that his child was not selected because of any supposed carelessness on the part of the parent.

If a child is found to need medical or dental treatment the parent is notified of the defect and the need for treatment. Cases which need special treatment in the school or modified conditions are reported to the teachers.

In the Cape Province there is no provision for the treatment of defects in necessitous children. Those who are unable to pay for private treatment attend hospitals, or are helped by Child Welfare Societies, the A.C.V.V., or similar organizations. But in some areas the difficulty of getting treatment is great, as to reach the nearest doctor or hospital may require a long and expensive journey. Even in towns there is often no provision for the treatment of minor cases, and as far as dental disease goes the only treatment is extracting, except in a few cases where dentists and Child Welfare Societies have combined to give free conservative treatment. The percentage of children obtaining treatment was at first about 40 per cent., but for 1924 reached nearly 60 per cent.

It will be seen from the statistics which follow that of the routine age groups, about 40 per cent. of children are handicapped by physical defects, even if we omit minor cases and cases of early dental decay. About 25 per cent. of the children seen are in need of treatment at the time of examination. This figure is higher for the specially selected cases.

The Cape Province covers such a wide area, and varies so much in climate and conditions of living that it is very difficult to give a general summary of the physical condition of the children which would be true of all areas. Briefly, it may be said that dental decay is much commoner along the coast line than inland, while rheumatism, chorea, and diseases of the nose and throat are commoner at higher altitudes. Malnutrition is much commoner than is usually credited, and though in many instances it is due to poverty, it is also largely due to ignorance of food values, an unbalanced diet, and in times of drought and scarcity to a lack of milk and fresh foods. Bilharziosis is only found in some parts of the Eastern Province, and malaria rarely occurs in the Cape Province itself. Malta fever occurs in certain areas, and trachoma is found in some parts, usually where the poor white problem is acute. On the whole the children in the Cape Province come from healthy stock, and under good conditions develop well. But there is in all classes widespread ignorance as to the essentials for healthy living. With better knowledge of hygiene, an educated public opinion to raise the standard of health, and the provision of a complete service aiming at the prevention of defects, the number of children found defective at medical inspection would diminish rapidly, and the general level of health and efficiency would rise correspondingly.

The following tables show (*a*) the number of children examined, and (*b*) the principal defects observed.

Cape of Good Hope—Medical Inspection of Schools, 1921 *to* 1924.

(ii) *Natal.*—In August, 1916, Dr. A. B. M. Thompson was appointed as Medical Inspector of Schools, and Medical Inspection was thereafter carried on as a voluntary service until the Medical Inspection Ordinance, No. 4 of 1918, was passed by the Provincial Council. The necessity for this Ordinance was apparent at a very early stage, as permission to examine verminous children, children suffering from venereal disease and infectious disease, etc., i.e. those children who, from the point of view of the public health, most needed medical inspection, was very frequently refused.

Two school clinics were established, one in the Education Office, Pietermaritzburg, and one in the Town Hall, Durban. Two nurses now attend the school clinic in Durban, and the chief school nurse is in charge of the school clinic in Maritzburg. Another school nurse has been appointed to the Northern District, with headquarters at Dundee, whilst a certificated masseuse is in charge of the clinic at the Open Air School in Durban.

An assistant medical inspector was appointed in 1918, but vacated the appointment after only short service. Dr. A. B. M. Thompson resigned his appointment in 1920, and was succeeded by Dr. C. G. Kay Sharp. At the same time an assistant medical inspector of schools was again appointed, but resigned in 1922.

In 1922 a panel of specialists was formed, to which were appointed the medical practitioners of Pietermaritzburg and Durban, who practice solely in psychiatry, eye, or ear, nose, and throat diseases.

In the scheme of medical inspection of schools in Natal is included periodical visitation of all the Government and Government-aided Schools of the Province, with examination of entrants, children who are fourteen years of age, and such children as parents or teachers may desire to have medically examined (specials). All parents are warned prior to the medical inspection and may consult the medical inspector at school regarding their children's health free of charge. A notice is forwarded to parents regarding all children found to be defective and where necessary a note to the family doctor is also included. No treatment or prescriptions are given at the schools, with the exception of minor dressings. Children who require treatment are referred to their own family doctor or to a school clinic or to a hospital.

A record is kept of every defective child, and such children are "followed up" by the school nurse at subsequent visits. In addition to advice given to the parents who attend medical inspection, the head teacher is also advised as to the limitations, etc., which should be placed on the school life of defective children. Mentally defective children are referred wherever possible, to the psychiatrist. A psychiatric clinic is held once a month in the Durban school clinic. School buildings and hostels are also inspected from a public health point of view at each visit. The Katathermometric Standard of Ventilation is recorded, especially in the hot weather. The Kata-Standards in the coastal schools of Natal are recorded in the report of the medical officer for the Province, 1923 (Education Department, Natal).

The attendance of the medical officer at the school clinics is, on account of the large amount of travelling involved in the medical inspection of schools in the Province, somewhat erratic, but good work is done at these clinics by the school nurses. Minor dressings are provided and advice on all matters appertaining to the health of the school child is given. Treatment is only given to poor or indigent children. The school clinics constitute bureaux of medical advice on all matters appertaining to the health of the school child. At the Durban school clinic a psychiatric clinic is held once a month, Dr. Egerton Brown, O.B.E., or one of his colleagues from the Mental Hospital being in attendance. A psychiatrist attends the Maritzburg school clinic when necessary. Medical statistical records are kept, including details of each child found to be physically or mentally defective.

Infectious diseases occurring in schools in Natal are notifiable to the Education Department. Proposed sites and plans of school buildings, alterations, and sanitation, medical certificates in respect of school teachers and children are examined and reported upon.

The following contributions to the medical journals have been made during the current year :—

"Schistosomiasis in Natal".....	Dr. C. G. Kay Sharp, *S.A. Medical Record.*
"Treatment of Schistosomiasis"...	A Review—Dr. C. G. Kay Sharp, *S.A. Medical Journal.*
"The Prevention of High Myopia in School Children"	Dr. C. G. Kay Sharp, *S.A. Medical Record.*

From the inception of the medical inspection of schools up to December, 1924, 15,845 routine and 9,090 special Medical examinations of children were made. The attendances at the school clinics at Pietermaritzburg and Durban numbered 8,558, while there were in addition 80,713 medical inspections by school nurses.

(iii) *Transvaal.*—Medical Inspection was introduced in this Province in 1914. The first Medical Inspector of Schools was Dr. C. L. Leipoldt, who organized the work and commenced routine inspection. His activities were, however, interrupted in October, 1914, on account of the war, when he had to join the military forces.

In 1915, inspection of schools was resumed, and the staff was increased by the appointment of two assistant medical inspectors of schools and an extra staff nurse. Since 1914 the nursing and medical staff have gradually been increased, and at present there are working eleven school nurses and three full-time medical inspectors of schools (two actually working, one still to be appointed to fill a vacancy).

There are two clinics existing at present in the Transvaal, and the establishment of a third clinic is being considered at Pretoria. The principal clinic in the Transvaal is situated in Johannesburg, and forms the headquarters of the medical inspectors, where all the administrative work, etc., is carried out. The clinic staff in Johannesburg consists of one full-time dentist, two eye specialists, two ear, nose, and throat specialists, two medical officers for minor ailments, and two anaesthetists. All the specialists working are part-time medical officers.

The Johannesburg clinic is also the centre of all medical school work in the Transvaal, and all cases are treated at this centre as much as possible ; but as the clinic is not a hospital and closes over the week-end, all cases that require more than one or two days' hospital treatment are sent to the General Hospital or the Children's Hospital.

The work at the clinic is more or less divided in such a manner as to reserve the school holidays for treatment of country children. These children come to the clinic in batches of ten and even more and are attended to and returned again to their different homes. Only indigent children are treated at Government expense, and part-paying patients are not accepted. Children from country districts can be conveyed to and treated at the clinic free of any charge on the production of a magistrate's certificate of indigency. The intentions of the clinics are not only to treat indigent cases but also to work in an educative sense, that is, to instruct children in general hygiene and to give demonstrations of home nursing, etc., to pupils of the upper standards of the primary schools.

The second fully established clinic is situated at Potchefstroom, where there are at work a part-time medical officer and a part-time dentist.

At Pretoria the medical staff consists of one part-time dentist and one eye specialist, while one of the medical inspectors regularly attends the nucleus of a clinic to deal with minor ailments, etc.

The nursing staff of the Education Department consists of eleven nurses, six of whom are working in the Rand Central area. These nurses visit the schools periodically and supervise the cleanliness, etc., and report on defects which they suspect. They also visit the homes of parents to investigate the conditions under which the children live and to give the parents advice as to the possibilities of carrying out the treatment that has been recommended for their children by the school medical officers. They also try as far as possible, to follow up cases that have received treatment, but on account of the migratory character of the population of the Rand areas the work is handicapped to a very great extent. The remainder of the nursing staff works in the country districts, e.g. Ermelo, East Rand, West Rand, Potchefstroom, and Pretoria. These nurses, of course, have a much wider area to attend to than those of the Rand Central area, and naturally their activities are more limited. The general difficulty in the country districts is transport, and it is not possible for a nurse stationed in a district to visit all the schools in her area. In some areas the difficulty of transport has been overcome by the courtesy of the inspectors of schools, who are willing to convey a nurse from one school to another when they go on their inspection tours. All nurses are instructed to give lectures on hygiene, etc., in the schools in their area. This scheme is being properly carried out in the Rand Central areas at present, but for obvious reasons it is very difficult to do the same in the country districts.

Although medical inspection has gone ahead with enormous strides since 1914, it is still far from having reached its optimum activities. The general stumbling block for the extension of medical school work in the Transvaal is the absence of funds to finance sufficient staff to carry out the work in a more or less satisfactory way. On all sides it is realized that the work is necessary and on principle should be extended as far as possible, but the practical execution is difficult. The method of inspection employed at present by the medical inspector of schools is the following :—

In the towns of the Rand area and at Pretoria the schools are examined as regularly as possible ; approximately one examination every two years, and in these areas only the *entrants-leaver* groups are examined and special cases which are referred to the medical inspectors by the class teachers. The rest of the Transvaal is taken according to the area of each school board and, if possible, is systematically examined. In this way it is possible within a short period to receive enough information about every school in the Transvaal to form an opinion as far as the health conditions, etc., are concerned of each area and also of the whole of the Transvaal. On account of the weather conditions country work is generally done during the winter and town work during the summer terms. Inspections are limited to the primary government schools, and if these are done thoroughly there will be very little left to be done in the high schools. The average number of children examined by each medical inspector is between seven and eight thousand per annum.

(iv) *Orange Free State.*—A school medical service for the Province of the Orange Free State was instituted in July, 1920, by the appointment of Dr. C. F. A. Oberlander as the first Medical Inspector of Schools, and the systematic examination of school children has since been conducted single-handed for the whole of the Province by the present officer, without the assistance of a school nurse.

Although provision has been made on the medical record cards for three routine examinations in the course of the child's school career, inspection is for the present confined to the *entrant-leaver* group ages only, but in addition to these there are non-routine (special) examinations of children presented for some defect by teachers or parents.

Inspection is generally arranged for in a classroom. The principal of the school having selected the children of the definite age-groups for that year, as well as the number of special or urgent cases requiring examination, notifies the parents (or guardians) of the day and hour of the school doctor's visit in order that they may be present at the examination. Every child is examined individually in the presence of the parent, the boys separately from the girls, and the findings are entered upon the record cards, which are kept for future reference. Should a defect be discovered, the parent's attention is drawn to it and a printed card, stating the defect, filled in, urging the parent to seek the advice of the family doctor. Advice bearing on the case is given at the time of examination, but no further treatment is prescribed. The principal keeps a record of the defect and other particulars.

In the absence of a school nurse there is at present no existing arrangement for "following up" defective cases, and no special provision has as yet been made for the treatment of necessitous children, except such as obtains at the local hospitals. In country districts the only available means of treatment of such children is that afforded by the services of the District Surgeon, until the evolution of a school clinic or other adequate machinery. Statistics of treatment, therefore, are based on the records kept by principals of schools.

The outbreak of an infectious disease in a school is notified by the principal to the Education Department, the secretary of the school board, the local magistrate, the medical inspector of schools, Bloemfontein, and the inspector of schools for the district.

Children are excluded from school for the following reasons: (*a*) to prevent the spread of disease; (*b*) on the ground that their uncleanly or verminous condition is detrimental to other scholars, and (*c*) owing to their mental or physical condition they are incapable of receiving proper benefit from the instruction in the school.

SUMMARY OF RESULTS OF INSPECTION, 1920 TO 1924.

Class of Inspection.	Number of Children Examined.	Number of Children Found Defective.	Percentage of Defectives.	Main Defects, with Average Percentage.	Average Percentage of Cases Treated.
				%	
Routine.....	3,273	4,429	47·5	Malnutrition.....10·6	41·1
Special.....	6,183			Teeth.....15·1	
				Nose and Throat....22·7	
				Vision..... 7·1	
				Skin..... 3·7	
				Deformities..... 3·2	
				Hearing..... 3·1	
				Organic Heart..... 0·2	
TOTAL.....	9,456			Intelligence..... 0·9	

The defects registered for teeth, eyes, nose, and throat are absolute defects needing treatment. Were minor defects included not needing treatment, the percentage of defectives would be far higher. Of all the defects prevailing amongst the school population of the Province, those of the mouth and teeth easily furnish the largest percentage. An estimation of the incidence of carious teeth has been taken only in cases of progressive decay causing general impairment of health. There is an unusually high percentage of nose, ear, and throat ailments and a marked prevalence of contagious skin diseases.

In regard to malnutrition, school feeding is provided for by local committees in a great many of the larger town schools of the Province. There is, however, as far as can be gathered, no provision for *care* committee supervision at these centres, the work of selection being left entirely in the hands of the principals and the expense of providing meals defrayed by local voluntary agencies.

The estimate of the number of mentally defective children of the primary school population is based upon the examination mainly of a number of children selected by teachers on the ground of alleged mental deficiency, and is the mean average of widely divergent extremes, as the incidence of mental defect varies considerably in different parts of the country. A special inquiry in regard to the mental calibre of the school population is

under consideration and will occupy the attention of a specially appointed psychiatrist in the course of the year, when more data bearing on the subject will be available and a definite form established by means of which the mental age of every school child throughout the Province may be ascertained.

§ 6. Intelligence Tests.

A committee has been formed under the auspices of the Research Grant Board to investigate the practicability of conducting an intelligence test in the schools of the Union. The members are as follows:—

Professor Wilcocks, Stellenbosch (*Chairman*).
Professor Hoernle, Witwatersrand.
Professor Reyburn, Cape Town.
Dr. Dunston, Commissioner of Mental Hygiene, and
Dr. Van Schalkwyk, Union Education Department.

The committee has decided to test some 60,000 children between the ages of 10 and 15, selected so as to represent the different areas of the Union and the different social strata and classes in it. The committee is now engaged on the task of designing and standardizing tests in both official languages, two sets of tests in each language. It hopes to conduct the actual test during the year 1926.

§ 7. Scientific Research in the Union.*

An article describing the principal scientific research facilities existing in the Union was included in the sixth and previous issues of this *Year Book*, but has not been repeated owing to exigencies of space. Particulars were given in this article of the research work done at various universities and university colleges, the activities of the Research Grant Board, and the organization and work of the South African Institute for Medical Research, with which is associated the Miners' Phthisis Medical Bureau (see page 265). Some reference to the scientific research done at South African universities and colleges will be found in § 1 of this chapter, in the paragraphs devoted to the various institutions. The new buildings being added to the South African Institute for Medical Research, which with equipment will cost about £15,000, were nearing completion at the beginning of 1925. A block of stabling with laboratory attached, for serum horses, has also been added at a cost of £4,000. The Institute, however, is experiencing great difficulty in securing the services of experienced research workers, owing to the apparent disinclination on the part of such workers to leave European centres and to there being no suitably qualified persons graduating from the local universities. During the year commencing 1st April, 1925, the Union Government and the Witwatersrand Native Labour Association have together increased their annual grant to £10,000, each paying in equal proportions. This has permitted of considerable extension in research work, and part of the increased grant is being utilized to carry out research on plague.

For the financial year 1925–26 the Research Grant Board has been provided with a sum of £1,850 to be allocated to the work of miscellaneous research.

§ 8. Miscellaneous.

1. **Public Libraries.**—(i) *General.*—In earlier issues of this *Year Book* (Nos. 1 to 6) historical particulars were given of the four libraries designated by the *Copyright Act* (No. 9 of 1916) for the receipt of all publications copyrighted in the Union, viz., the South African Public Library, Cape Town, the State Library, Pretoria, the Library of the Natal Society, Pietermaritzburg, and the Bloemfontein Public Library. The *South African Public Library*, which is a national institution, was founded in 1818, and is the oldest and largest library in the Union. It contains the Dessinian, Grey, Hofmeyr, and Wessels Collections, and is especially rich in literature relating to South Africa and in sets of scientific serial publications. In 1925, through the beneficence of Sir Abe Bailey, the famous library of the late W. G. Fairbridge, consisting of over 13,000 volumes of surpassing South African importance, comprising copies of works in English and Dutch, was acquired and presented as a gift to the nation. In addition, Sir Abe Bailey gave his own collection consisting of 2,000 volumes, containing many old Dutch works of great value. The collection is being housed in a special building constructed in connexion with the South African Public Library, Capetown, and will be open to the public three days a week. The other three days are reserved for the students of the Cape Town and Stellenbosch Universities, and the Diocesan College, Rondebosch. The *Pretoria State Library* was established in 1887, and has advanced from small beginnings to being one of the most extensive and valuable book collections in South

* A comprehensive report on this subject, prepared by a Committee of the Research Grant Board was published in the *South African Journal of Industries* (Vol. VII, No. 4, April, 1924).

Africa, including as it does a very comprehensive bibliography of early Transvaal records and general South African literature. The *Library of the Natal Society* originated in a small public library, started at Pietermaritzburg in 1846, and was subsequently taken over by the Natal Society, which was founded in 1851 and incorporated in 1874, with the object of promoting the study and cultivation of the various branches of art, science, literature, and philosophy. One of the distinguishing features of the library is the valuable and comprehensive music section. The *Bloemfontein Public Library* was established in 1875, and after many vicissitudes it has now developed into a considerable institution. The library possesses a good collection of Orange Free State records, and one of its features is a children's reading-room, the gift of the municipality, from whom the library has received a great deal of support.

(ii) *Statistics as to Public Libraries.*—The following tables give statistics as to public libraries in receipt of Government grants and other libraries in the Union for a period of years, with (*a*) particulars as to the number of books, number of subscribers, and monthly circulation of books; and (*b*) the amount of revenue and expenditure :—

(*a*) STATISTICS OF PUBLIC LIBRARIES.

3. **Museums.**—*The South African Museum, Cape Town,* was established in 1855 and is under the control of a Director, who is responsible to the trustees. The present trustees are the Hon. J. W. Jagger, F.S.S., M.L.A. (Chairman), the Right Hon. John X. Merriman, P.C., Sir Thomas Muir, Kt., C.M.G., M.A., LL.D., D.Sc., F.R.S., Professor W. A. Jolly, D.Sc., and Councillor W. F. Fish, J.P. (present Mayor of Cape Town). There is a scientific staff of five assistants under the Director and Keeper.

The total number of specimens dealt with by the staff during the year 1924 was 4,500, of which over 300 were forms new to the collection, and many new to science. The results of the scientific investigation of the Museum collections are published in the "Annals of the South African Museum," twenty-four volumes of which are completed or in course of publication.

An annexe to the Museum, known as the Koopmans De Wet House Museum, is devoted to the exhibition of early Cape-made furniture and domestic appurtenances in use from the Settlement to about the year 1830.

Further particulars, descriptive of the principal collections in the Museum, will be found in the sixth and earlier issues of this *Year Book.* Statistics of the Museum are given in paragraph (iii) below.

(ii) *Transvaal Museum.*—The Transvaal Museum, Pretoria, was established in 1893, and officially opened on 15th May, 1894, by President S. J. P. Kruger and the members of the First and Second Volksraad, under the name of the "Staatsmuseum."

Details of the history and various sections of the Museum are given in the sixth and earlier issues of this *Year Book.* The table in the next paragraph contains statistics of the institution.

(iii) *Particulars of Museums.*—Particulars are given hereunder for the year 1924 in regard to all museums in the Union :—

MUSEUMS—NUMBER OF VISITORS, VALUE OF BUILDINGS, ETC., REVENUE AND EXPENDITURE, 1924.

Museum.	Date of Establishment.	Number of Visitors.	Value of Buildings and Furniture.	Insured Value of Contents.	Receipts.		Total Expenditure.

* No record kept.

4. **Zoological Gardens.**—The National Zoological Gardens of South Africa, Pretoria, were established in 1899 under the Government of the late South African Republic, and are under the control of a Director (Dr. A. K. Haagner, F.Z.S.), who is responsible to a Committee of Management (Chairman, H. C. Jorissen, Esq.). The collection of animals is the best of its kind in South Africa, and the gardens rank with some of the oldest in the world for beauty, size, and lay-out.

Zoological Gardens have also been opened at Johannesburg and Durban.

The following table contains a statement of the number of visitors, receipts, and expenditure of Zoological Gardens :—

ZOOLOGICAL GARDENS—NUMBER OF VISITORS, RECEIPTS, EXPENDITURE, ETC., 1924.

HEADING.	National Zoological Gardens, Pretoria.	Zoological Gardens, Johannesburg.	Zoological Gardens, Durban.
Date of establishment	1899	1903	1908

New buildings	77	1,400	—
Animal food	2,957	2,200	482
Other expenditure	2,879	2,550	962
TOTAL £	12,718	16,520	2,214

5. **Botanic Gardens.**—(i) *National Botanic Gardens, Kirstenbosch, near Cape Town.*—The National Botanic Gardens were established on the Kirstenbosch Estate (about 200 morgen, part of the Groote Schuur Estate) on 1st July, 1913, and are controlled by a Board of Trustees acting through a Director, who is one of the two Professors of Botany in the University of Cape Town. The first Director was the late Professor H. H. W. Pearson, M.A., D.Sc., F.R.S., whose interest and work were largely responsible for the establishment of the Gardens. The present Director is Professor R. H. Compton, M.A. ; Curator, Mr. J. W. Mathews, F.R.H.S.

During 1922 the area was increased by 340 morgen, comprising the whole of the Table Mountain slopes immediately behind Kirstenbosch proper, and over to the boundaries of the Cape Town and Wynberg Waterworks Catchment areas. This area has been transferred from the Forest Department as a Nature Reserve for Flora and Fauna.

Descriptive details of the gardens, which occupy a site of remarkable beauty, will be found in the sixth and previous issues of this *Year Book*.

(ii) *General.*—A statement containing particulars of the Botanical Gardens in the Union is given hereunder :—

BOTANICAL GARDENS—NUMBER OF VISITORS, RECEIPTS AND EXPENDITURE, 1924.

Heading.	Municipal Botanic Gardens, Cape Town.	National Botanic Gardens, Kirsten-bosch.	Botanic Gardens, King William's Town.	Botanic Gardens, Grahams-town.	Botanic Gardens, Graaff-Reinet.	Municipal Botanic Gardens, Durban.	Botanic Gardens, Pieter-maritz-burg.

* No records kept. † Saturdays, Sundays, and Public Holidays only.

6. **Registered Newspapers.**—Every periodical published in the Union, in order to pass through the post at the newspaper rate of postage, must be registered with the Postmaster-General and must have the words, " Registered at the General Post Office as a newspaper," printed, on the front page of each copy. The registration fee is 2s. 6d. per annum. The following table shows the number of newspapers registered in the Union at the 31st December during a series of years :—

CHAPTER V.

LABOUR AND INDUSTRIAL CONDITIONS.

§ 1. Union Department of Labour.

1. **Formation of Department of Labour.**—The Ministry of Labour was constituted on the 25th July, 1924, and its constitution was due to a realization of the existence of acute conditions in the economic and industrial life of the Union with which no Department was appointed to deal comprehensively and effectively. The duties of administrating certain laws dealing with labour and industrial questions were assigned to several Departments, but it was not the special duty of any Department to deal with labour questions as a whole; nor was there any administrative machinery to co-ordinate the various functions and to give effect to a national policy.

Consequent upon the constitution of the Ministry of Labour the Department of Labour was established in terms of Government Notice No. 1305 of 6th August, 1924.

The head office of the Department of Labour is located in the Union Buildings, Pretoria, while Divisional Inspectorates have been appointed for the Witwatersrand, Pretoria, Cape Town, Durban, Bloemfontein, Port Elizabeth, East London, Kimberley, and Pietermaritzburg Districts.

2. **Functions of the Department of Labour.**—The primary functions of the Department of Labour are as follows:—

(*a*) Employment generally, including Government works and unemployment relief works.

(*b*) Rehabilitation of the rural poor and unemployed and their training for employment.

(*c*) Conciliation boards, industrial councils, registration of trade unions and employers' organizations, private registry offices, etc.

(*d*) Wage Act.

(*e*) Juvenile affairs.

(*f*) Apprenticeship.

(*g*) Factories.

(*h*) Social conditions and welfare.

(*i*) International Labour Office affairs.

3. **Advisory Council of Labour.**—With a view to achieving effective touch with the views of people outside the machinery and personnel of the Department of Labour itself, the Minister of Labour appointed an advisory council to investigate and advise upon the problems of labour and unemployment from various aspects. The Council meets at intervals at the instance of the Minister, but it is an advisory body only, and is not responsible for the policy of the Ministry of Labour. The interests for which the Council stands may be thus briefly indicated:—

(*a*) The rural interests of agricultural community, involving in particular the difficult problem of the "poor white," and the development of labour and social conditions on the agricultural side.

(*b*) The three great urban occupations of mining, manufacturing, and commerce.

(*c*) Labour in its broadest sense.

(*d*) Social welfare and woman's interests.

The Advisory Council of Labour as originally appointed consisted of the following:—

Rev. M. L. Fick, M.L.A., Messrs. G. H. Beatty, G. A. H. Bridson, J. H. Conradie, M.L.A., E. Cresswell, A. F. Crisp, J. Curran, J. S. Hancock, Walter Marshall, D. McWilliams, A. M. Mostert, Mrs. M. S. Walsh, and Mrs. S. Wardingham, Secretary, C. E. L. Bell.

Mr. J. H. Conradie, M.L.A., and Mr. G. H. Beatty have since resigned from the Council, and the former has been succeeded by Dr. H. P. v. d. Merwe.

Special committees of the Council have examined and reported upon the following questions :—

Rural unemployment.
Urban unemployment.
Conditions on the alluvial diggings.
Registration of trade unions.
Poor relief.
Amendment of the Apprenticeship Act and the Industrial Conciliation Act.

The Advisory Council of Labour, representing as it does various interests in different parts of the Union, fulfils in itself the requirements of the Washington Convention on unemployment as far as the establishment of local committees is concerned. In centres where direct representation is effected by members of the Advisory Council, such unemployment committees have ceased to function and have been replaced by the local members of the Advisory Council of Labour.

4. **The Social and Industrial Review.** —*The Social and Industrial Review*, previous to January, 1926, published as *The South African Labour Gazette*, the first issue of which appeared in April, 1925, under the title of *The Labour Gazette*, is the official organ by which the Department of Labour keeps the public in touch with its work and with the more important aspects of labour and industrial conditions in the Union and in other countries. The *Review* is also sent to Governments in other countries with which an interchange of publications has been arranged.

§ 2. Labour Conditions, Unemployment, and Relief Works.

1. **General Conditions of Labour in the Union.**—All questions concerning the conditions and payment of labour in the Union are affected, and in almost every instance complicated, by the existence of the numerically predominant native and coloured elements of the population. In considering any aspect of labour and industrial matters the presence of native, Asiatic, and other non-European workers largely outnumbering the European workers of the country must be accepted as a qualifying and in some cases a governing factor. The existence of this class of comparatively cheap labour has influenced the development of the country in various ways. The imported Indian labourers of Natal made possible in the early days the remarkable progress of the sugar industry, supplied the tea-planters with suitable workers, and provided much of the necessary labour for railway construction and coal mining. The gold mines of the Witwatersrand have been and are still entirely dependent upon the adequacy of the supplies of native labour ; while in the industrial districts of the Cape Province, and to some extent also in Natal, the coloured worker of mixed race has not only supplied very largely the demand for unskilled labour, but has in many cases qualified as a semi-skilled artizan and not infrequently has shown himself of equal skill with the European artizan. Moreover, practically all the farms in the Union employ native or coloured labour and are indeed almost entirely dependent upon it for all general labouring work in agricultural and pastoral operations.

As the result of the presence of this large section of workers the position of the European worker has been limited to a considerable degree to the more highly remunerated lines of the skilled trades or to the work of supervising, overlooking, and controlling the unskilled labourers who are employed in practically every industrial or agricultural operation in the Union. The unskilled European worker has of necessity found himself almost inevitably in competition with the native or coloured labourer, forced to maintain a higher standard of living, but unable to command a sufficiently high rate of pay. The conditions thus brought into being have affected in the most marked degree every question concerning labour in the Union and have introduced social and economic difficulties of a serious kind, and of a type not to be found in any of the other self-governing Dominions. There is for example in the Union a portion of the population generally known under the somewhat unsatisfactory name of *poor whites*, whose number though never accurately determined is known to be very considerable, and whose presence in the great industrial centres and other urban areas has been recognized as constituting one of the greatest social problems of the Union.

2. **Occupations of Union Population.**—The following table shows the number and percentage of males and females gainfully employed in 1921, in the principal occupations of the country.

3. Government Employment Exchanges.*—The Labour Department administers employment exchanges at Cape Town, Johannesburg, Pretoria, Durban, Bloemfontein, Port Elizabeth, East London, and Kimberley. Each of these exchanges is under the supervision of a divisional inspector of the Department. Subsidiary employment offices, which are visited at regular intervals by officers of the Department, exist at Krugersdorp, Germiston, Boksburg, Benoni, Brakpan, and Wynberg. Magistrates refer all labour matters arising in their districts to the divisional inspectors at the centres named. A separate employment office is conducted by the Miners' Phthisis Board at Johannesburg, with the object of endeavouring to find employment for men suffering from phthisis.

A system of utilizing certain post offices as subsidiary employment exchanges was inaugurated in October, 1924. The postmasters at these offices work in conjunction with the inspectors of labour for the particular districts in which their offices are situated. By this means it is possible to keep the rural unemployed in touch with the labour conditions in the urban areas, and prevent a drift of unemployed to towns which already have a surplus of unskilled labour. By means of these exchanges it may also become possible to replace in agricultural employment numbers of the rural population congregated in the towns.

The Department issues a monthly bulletin giving information as to the number of applications for employment, the demands from employers for labour, and the number placed in employment at each labour exchange, under the various trade groups. A precis of the inspectors' reports for the month is published in *The Social and Industrial Review*, and is circulated to the Press and the High Commissioner's Office in London, and the Trades Commissioners in South Africa are supplied with information in regard to labour and industrial conditions generally in the Union.

Facilities in the nature of rail warrants are in certain circumstances given to enable unemployed persons to proceed to employment. Such warrants are issued "free" or "on repayment" according to the wage obtained by the applicant. Special interest is taken in the question of settling Europeans and their families on the land, by placing suitable men with farmers needing labourers and in any other way which may be found possible.

* For particulars of the Cape Labour Bureau and other bodies which preceded the present Employment Exchange system, see previous issues of this *Year Book* (Nos. 1 to 6).

The tables given below contain particulars of the employment phase of the work of the several Government employment exchanges for a series of years :—

* In addition, 14,507 men were sent to relief works in 1922.
† In addition, 8,714 men were placed on relief works in 1923.
‡ In addition, 8,303 men were placed on relief works in 1924.

4. **Private Registry Offices.**—All private employment exchanges in the Union, which charge or recover any payment for or in connexion with procuring employment, are subject to the provision of section 20 of Act No. 11 of 1924. All such exchanges are required to apply to the Department of Labour for registration and are not permitted to function unless a certificate of registration is issued. Twenty-three private exchanges have been duly registered and, for the most part, operate in connexion with domestic employment.

5. **Unemployment Relief Work.**—Towards the end of 1920, owing to depression and increasing unemployment, it became necessary to institute relief works on Government undertakings with a view to finding employment for those whom the labour exchanges could not assist. A committee of heads of Government Departments, presided over by the Minister of Lands, was appointed to explore possible avenues of employment and to decide upon and assume responsibility for relief work. In the initial stages, the operations of this committee were confined to the Transvaal Province, but its activities were gradually extended throughout the Union. On the establishment of the Department of Labour this committee ceased to function, all works under its surveillance being transferred to that Department.

The relief works may be classified as *subsidized* and *non-subsidized*. In the case of subsidized works the funds voted by Parliament bear in a general way the difference or a part of the difference in cost between the employment of European and native labour. Such differences were paid in the form of subsidies to Government Departments, to the Railway Administration and to municipalities employing European labour on works approved in the first instance by the Unemployment Committee and latterly by the Department of Labour.

6. **Government Relief Workers.**—At the end of 1924, in pursuance of the declared policy of the Government regarding the employment of civilized labour, the Railways Administration assumed full financial responsibility for its European labour force.

As a result of the improved agricultural conditions in 1925, the number of subsidized men on Government relief works has gradually dropped as shown in the following table :—

	March, 1925.	*September*, 1925.
Irrigation Department	769	311
Transvaal Provincial Administration	996	209
Orange Free State Provincial Administration	304	167
Cape Provincial Administration	1,813	—

7. **Municipal Relief Works.**—The acute distress prevailing in 1924, in many of the urban areas, necessitated the institution of some form of relief works.

The Department of Labour agreed to subsidize various municipalities, such subsidy being based on the difference between the customary native daily wage and a fair minimum wage to European labour. The number of subsidized men on such works gradually decreased from 2,906 in September, 1924, to 2,439 in March, 1925, and 1,260 in September, 1925. This reduction has, in part, been due to the offer by the Department of Labour of other work to men so employed, such work being either on afforestation settlements, training farms or agriculture under the direction of the Department.

To obviate the unsatisfactory features of this system of computing subsidy, and with a view to affording local authorities an opportunity of utilizing European labour on a basis of efficient service, efforts were made to recast the system of employment under municipal control. The authorities responsible for local relief works were asked to let out such work in sectional contracts on a basis of European labour with a stipulated minimum wage, the Department of Labour sharing with the authority concerned the difference in cost between this contract price and the price tendered to carry out the work by native labour. Where the authority preferred to carry out the work departmentally in place of letting it by contract, the Department of Labour offered to subsidize the earnings of the workers on piece-work at a rate decreasing as the earnings of the workers rose.

By these means it was hoped to demonstrate the possibilities of utilizing European labour on work hitherto confined to natives and in time gradually to withdraw the subsidy paid by the Department of Labour.

8. **Afforestation Settlements.**—Afforestation settlements have been established at La Motte, Jonkersberg, Loerie, Otterford, Karatara, and Bergplaats in the Cape Province, at Weza in Natal, and at Berlin in the Transvaal. Workers drafted to those settlements are recruited from the relief works and are accompanied by their families, for whom accommodation is provided. Remuneration is arranged on a piece-work basis, on seven of the settlements. The average daily piece-work earnings on these settlements from January to September, 1925, were :—

January	8s. 5d.	June	8s. 8d.
February	8s. 5d.	July	8s. 11d.
March	8s. 11d.	August	8s. 11d.
April	9s. 3d.	September	8s. 11d.
May	9s. 3d.		

These settlements are capable of accommodating approximately 1,000 families, from whom are selected men for agricultural occupations, either with private individuals under Government subsidy (see tenant-farmer system, ¶ 11) or under State schemes for closer settlement.

9. **Rural Unemployment and Rehabilitation of Rural Poor.**—Until complete statistics of unemployment in the Union become available, the position as a whole can only be estimated, and then by no means too closely. Further difficulty is experienced if an attempt is made to classify the unemployed in rural or urban categories as the distress amongst the rural population, due to economic conditions and continued drought, results in a marked drift of the rural unemployed into the urban areas in the hope of obtaining some form of employment. A general indication of the position may, however, be obtained from an examination of the statistics of men employed on the various relief works.

In August, 1922, there were 7,920 men engaged on relief works. In May, 1923, the number had fallen to 4,284. From that date the number rose steadily until in September, 1924, a figure of 10,868 was reached. From that date, the number decreased steadily until at the end of September, 1925, when only 3,857 men remained on these works.

Various estimates have been given of the number of persons in rural areas who would be described generally as *poor whites*. The figures usually accepted vary from 100,000 to 150,000 persons.

10. **Training Farms and Land Settlements.**—Amongst the rural population (including those who have drifted into the towns from the country in which they were born and bred) there is a large number who are landless. Many of those, given the chance, are able to re-establish themselves on the land, and for such men as have some capital, provision is

made under settlement schemes by the Department of Lands. On the other hand, others can only be expected to make good after a considerable amount of discipline and training. To afford such training under discipline, the Department of Labour has established a training farm at Losperfontein, in the Rustenburg district of the Transvaal, on certain lands under irrigation from the Hartebeestpoort Lake. Men are drafted to this farm from both Government and municipal relief works and are given a training in intensive farming. Expert instruction is provided while a welfare superintendent sees to the social welfare of the workers, special attention being given to the education and training of the children. The workers on this farm when trained will be drafted to land settlement schemes under the Department of Lands or will be placed on the land under the *tenant-farmer system*, as agricultural labourers or foremen. Villages are being established on the farm in which the families of the workers are accommodated. No native labour is permitted.

11. **Tenant-Farmer System.**—This system was organized with a view to re-establishing on the land a section of the rural population accustomed to agriculture, but driven off the land by drought, pests, etc. Welfare officers operating under the control of the Department of Labour, cover the various farming districts to obtain from established farmers offers to take on tenant-farmers under this system, each proposition being considered on its merits. Loans not exceeding £150 for each tenant-farmer engaged are granted to the owners for the provision of implements, seed, or cattle, housing material, etc., the tenant-farmer being required to erect his own dwelling. These loans are repayable in yearly instalments. To enable him to maintain his family until his first crop is reaped, a subsidy is paid to the tenant-farmer for the first fifteen months at rates varying with the size of his family, up to a maximum of £5. 7s. 6d. per mensem.

The subsidy is paid at full rates for the first nine months and at half rates for a further six months.

The following table indicates the position as regards the placing of tenant-farmers (30th September, 1925), and may be viewed as the result of one year's application of the scheme :—

Particulars.	*No.*
Tenant-farmers placed and started work	363
Tenant-farmers for whom subsidy authorized and being placed	70
Loans to owners	322
Loans to tenant-farmers	160
Total loans approved	482
Amount of loans approved	£40,243

The placing of a tenant-farmer is conditional upon the farm owner undertaking to provide the necessary supervision, while the rural welfare officers of the Department of Labour exercise a general oversight over all tenant-farmers.

An extension of this scheme is being tried by placing tenant-farmers on a farm at Zanddrift, Brits area, Transvaal, which the Department of Labour has leased for a period of seven years with the option of purchase. Tenant-farmers placed on this farm will be under the direct control of rural welfare officers of the Department. A subsidy will be paid at a maximum rate of £5 per family per month and the products of the farm will be marketed co-operatively. The subsidy paid as well as the interest on the expenditure incurred on the purchase of implements, etc., and a share of the water rates will be charged against each tenant-farmer, and the excess of his share of the produce over and above these charges will be banked to his credit. By this means the tenant-farmer will obtain the full benefit of his work, and, when trained, will have a small reserve of capital with which to re-establish himself on the land.

§ 3. Conciliation Boards, Industrial Councils, Trade Unions, Employers' Organizations, Etc.

1. **Industrial Conciliation Act.**—The primary purpose of this Act (No. 11 of 1924) is " to make provision for the prevention and settlement of disputes between employers and employees by conciliation ; and for the registration and regulation of trade unions and private registry offices."

The Act applies to every industrial and public utility undertaking, to every industry, trade, and occupation, and to every employer and employee engaged in or at any such undertaking, industry, trade, or occupation. It does not extend to agricultural or farming employment, or, with certain exceptions, to Government employment. The establishment of *industrial councils* by employers or employers' organizations on the one hand, and registered trade unions or groups of registered trade unions on the other hand, for the regulation of matters between them and the prevention and settlement of disputes is provided for. Such councils must consist of an equal number of representatives of employers and employees, and are subject to registration. In areas where there are no industrial councils, *conciliation boards* may be formed in certain circumstances. Where both parties to any dispute under consideration by an industrial council or conciliation board apply to the Minister for the appointment of a mediator, or where the Minister thinks that settlement of the dispute

would be assisted thereby, the Minister may appoint a mediator. A majority of representatives of employers and employees respectively on an industrial council or conciliation board may decide upon the appointment of an umpire to give a decision in the event of the arbitrators failing to agree. Awards made by arbitrators or umpires are binding. It is unlawful to strike or lock-out when agreement has been arrived at as a result of the appointment of an arbitrator or umpire, or during the period of operation of any award made as the outcome of such appointment. The Minister may declare, on application by an industrial council or conciliation board, that any agreement arrived at shall be binding upon the parties thereto, and upon the employers and employees represented on the council or board; or may, if he is satisfied that the applicants are sufficiently representative of the undertaking, industry, trade or occupation concerned, declare that the agreement shall be binding upon all employers and employees in that undertaking, industry, trade, or occupation in the area over which the council or board has jurisdiction. The Minister may, at the request of the parties, extend the application of any award. One calendar month's notice of any alteration, or demand for alteration, in the terms of employment must be given by any employer or employee, unless shorter notice is mutually agreed to. If the matter at issue is submitted for consideration by an industrial council or conciliation board within fourteen days, it must await the determination of the body concerned. Special provision is made for the conduct of any dispute between a local authority and its employees engaged upon work connected with the supply of light, power, water, sanitary, transportation or fire extinguishing services which has remained unsettled notwithstanding the efforts of any industrial council or conciliation board. It is unlawful for any employer, employers' organization, trade union, or other person to declare any strike or lock-out until the matter at issue has been investigated by an industrial council, or, where there is no such council, by a conciliation board.

The Act provides for the appointment of a *registrar of trade unions and employers' organizations*, and for the registration of trade unions and employers' organizations, including unions of Government servants. If the registrar is satisfied that in the area, in respect of which it is proposed that the union or organization should be operative, no union or organization is already registered under the Act which is sufficiently representative of the industry concerned, he is required to register such union or organization. Every registered trade union and employers' organization is a body corporate, capable in law of suing and being sued. The laws governing companies, insurance companies, and friendly or provident societies do not apply to trade unions or employers' organizations in respect of the exercise by such unions or organizations of any function or the performance of any act under the Act or rules authorized thereunder.

The registration and regulation of *private registry offices* is obligatory. Persons in charge of registry offices must produce books and give information when required. They must also inform persons seeking employment of any dispute which may exist in the occupation or industry concerned.

The Minister may in certain eventualities step in and carry on any municipal service at the expense of the municipality.

The Act provides penalties for infringements of its provisions and empowers regulations to be made for the effective carrying out of its objects and purposes.

2. **Effects of Industrial Conciliation Act.**—The *Industrial Conciliation Act*, which came into operation in April, 1924, is being extensively used by industry, and the record of strikes and lock-outs since this Act came into operation is negligible. Experience of the administration of the Act goes to show that before entirely effective results can be looked for amending legislation of a more or less minor nature will be necessary. In order to enable industry to avail itself of the provisions of the Act, organization on the part of both employers and employees is necessary, but the ultimate result of the legislation has been to speed up organization both on the part of the employers and employees.

Fourteen conciliation boards and six industrial councils have been appointed, and at least six additional industrial councils are (January, 1926) in the course of formation.

In practically every instance the boards and councils were able to arrive at an agreement. A notable exception, however, occurred in the case of South African Mine Workers' Union conciliation board, in which a mediator was appointed, but the board was unable to arrive at an agreement, the Chamber of Mines not being prepared to accept the report of the mediator. Certain increases in wages, however, were subsequently granted, and further discussion has been left over pending issue of the report of the Economic and Wage Commission.

As stated above, the administration of the Act is still in the early stages, and the provision in the Act to the effect that agreements published by the Minister as the result of the findings of boards and councils are to be made binding for a specific period is making for the smooth working of the Act, in that most of these agreements are limited to a period of twelve months' duration, when they automatically come up for a review and amendment where necessary.

In two instances only, has it been possible for industry to meet on a national basis, viz: the printing and building industries. In all other instances the scope of agreements

has been limited to local areas. It will thus be seen that until such time as the employers and employees are able to organize on a national basis, the full fruits of this legislation will not be forthcoming and the question of inter-area competition and varying conditions will present difficulties.

The following schedule shows the details of conciliation boards and industrial councils appointed under the Act :—

	Matter in Dispute.	Result.
Conciliation Boards.		
1. Springs Mines Municipal Employees....	General working conditions..	Agreement arrived at.
2. Cape Town Tramway Workers.....	General working conditions..	Agreement arrived at.
3. Geldenhuis Deep Gold Mine.....	Alteration of contract wages	Agreement arrived at.
4. South African Mine Workers' Union....	Wages.....	Failed to agree.
5. Municipal Mechanics, Johannesburg.....	General working conditions..	Agreement arrived at.
6. Witwatersrand Building Trades Council.	Employment of a non-union member	Agreement arrived at.
7. Cape Building Industrial Workers.....	General working conditions..	Agreement arrived at.
8. Baking Employees' Association.....	Employment of a non-union member	Failed to agree, but Industrial Council subsequently appointed.
9. South African Reduction Workers.....	Wages of slimes men.....	Agreement arrived at.
10. Witwatersrand Tailors' Association.....	General working conditions..	Agreement arrived at.
11. Cape Furniture Workers.....	General working conditions..	Agreement arrived at.
12. Cape Operative Bakers.....	General working conditions..	Agreement arrived at.
13. Witwatersrand Shop Assistants' Association	General working conditions..	Board still in session.
14. Germiston Municipal Employees.....	Wages.....	Board still in session.
Industrial Councils.		
1. Printing (National) Industry.....	General working conditions..	Agreement arrived at.
2. Building (National) Industry.....	General working conditions..	Agreement arrived at.
3. Witwatersrand Clothing Industry.....	General working conditions..	Agreement arrived at.
4. Witwatersrand Footwear Industry.....	General working conditions..	Agreement arrived at.
5. Witwatersrand Bespoke Tailoring Industry	General working conditions..	Agreement arrived at.
6. Witwatersrand Baking Industry.....	General working conditions..	Agreement arrived at.

3. **Trade Unions Registered under Industrial Conciliation Act.**—The following table gives a list of the trade unions registered under the provisions of the Industrial Conciliation Act.

Month and Year of Registration.	Membership at Date of Registration.	Name of Union.
1924.		
August	100	Manufacturing Tailors Workers' Association and Sick Benefit Society.
,,	874	S.A. Shop Assistants', Warehousemen's, Clerks', and Hairdressers' Association.
,,	1,359	Underground Officials' Association of South Africa.
,,	457	Witwatersrand Tailors' Association.
October	510	Amalgamated Building Trade Union of South Africa.
,,	94	Amalgamated Society of Woodworkers.
,,	2,012	Building Workers' Industrial Union of South Africa.
,,	1,235	S.A. Amalgamated Engine-drivers' and Firemen's Association.
,,	4,557	S.A. Mine Workers' Union.
,,	765	S.A. Reduction Workers' Association.
,,	3,074	S.A. Typographical Union.
November	750	Cape Town and Camps Bay Tramway Workers' Industrial Union.
,,	368	Johannesburg Municipal Employees' Association.
,,	32	Johannesburg Municipal Waterworks Mechanics' Union.
,,	150	Musicians' Union of South Africa (Cape).
,,	80	Operative Plumbers', Gasfitters', and Sheet-metal Workers' Union of the Cape Province.
,,	2,000	S.A. Association of Municipal Employees.
December	2,973	Amalgamated Engineering Union.
,,	215	Commercial Workers' Union.
,,	42	Electrical Trades Union.
,,	26	Engine-drivers' and Firemen's Protection Society.
,,	200	Operative Bakers', Confectioners', and Conductors' Union.
,,	807	S.A. Boilermakers', Ironworkers', and Shipbuilders' Society.
,,	41	Transvaal Association of Mine Secretaries.
1925.		
January	198	Affiliated Plasterers' Trade Union of South Africa.
,,	25	African Stage Employees' Association.
,,	194	Johannesburg Musicians' Union.
,,	250	Natal Mine Workers' Association.
February	300	Cape Province Operative Painters' and Decorators' Union.
,,	1,966	Mine Surface Officials' Association of South Africa.
,,	499	S.A. Postmen's Association.
March	376	Ironmoulders' Trade Union of South Africa.
,,	700	Johannesburg Tramwaymen's Union.
,,	25	Port Elizabeth Operative Plumbers' Association.
,,	37	Queenstown Municipal Employees' Association.
,,	290	S.A. Operative Masons' Society.
,,	5,587	S.A.R. & H. Salaried Staff Association.

Month and Year of Registration.	Membership at Date of Registration.	Name of Union.
1925.		
April	200	Baking Employees' Association.
,,	1,250	Durban Municipal Employees' Society.
,,	282	Kimberley Shop Assistants', Warehousemen's, and Clerks' Association.
,,	40	Port Elizabeth Ostrich Feather Sorters' Association.
,,	3,534	S.A. Society of Bank Officials.
May	100	Bootmaking and Leather Industries Workers' Union.
,,	112	Cape Operative Bricklayers' Society (No. 1).
,,	760	Cape Town Municipal Workers' Association (Coloured).
,,	300	Great Brak River Leather Workers' Union.
,,	45	Kimberley Tramwaymen's Union.
,,	210	National Vehicle Builders' Union of South Africa.
,,	75	Pretoria Musicians' Association.
,,	37	Transvaal Trades Schools Teachers' Association.
June	100	Building Union of the Eastern Province.
,,	250	Cabinetmakers' Union.
,,	280	Johannesburg Boot and Shoe Workers' Union.
,,	43	Maritzburg Municipal Tramwaymen's Union.
,,	300	National Furniture Workers' Industrial Union.
,,	150	Pietermaritzburg Commercial Workers' Union.
July	24	Society of Dental Mechanicians of Natal.
August	86	Natal Musicians' Association.
,,	121	S.A. Association of Assayers.
,,	168	S.A. Meat Trade Employees' Association.
September	167	Liquor Trade and Catering Staff, Transvaal Division.
,,	84	Pretoria Tramwaymen's Union.
,,	34	Transvaal Mineral Waters Employees' Union.
October	160	Diamond Workers' Union.

4. **Employers' Organizations Registered under Industrial Conciliation Act.**—The following table gives a list of the employers' organizations registered under the provisions of the *Industrial Conciliation Act*.

Month and Year of Registration.	Name of Organization.
1924.	
August	Associated Master Printers of Bloemfontein.
,,	Associated Master Printers of the Transvaal.
,,	Border Master Printers' Association.
,,	Cape Chamber of Printing.
,,	Master Builders' and Allied Trades Association, Witwatersrand.
,,	Natal Chamber of Printing.
September	Cape Peninsula Building and Allied Trades Association.
November	Port Elizabeth Master Builders' and Allied Trades Association.
December	Kroonstad Master Builders' Association.
,,	Master Builders' Association, Pietermaritzburg.
1925.	
January	Central Area (Grade 2) Master Printers' Association.
,,	Federation of Master Printers of South Africa.
,,	Newspaper Press Union of South Africa.
February	Master Builders' Association, Durban.
,,	Port Elizabeth Master Printers' Association.
,,	Pretoria Master Builders' and Allied Trades Association.
,,	Pietermaritzburg Chamber of Printing.
March	East London Builders' Association.
April	Bloemfontein Builders' and Allied Trades Association.
,,	Retail Witwatersrand Master Butchers' Association.
May	Heidelberg and District Branch of the Master Builders' Association.
,,	National Federation of Building Trade Employers in South Africa.
,,	Transvaal Chamber of Mines.
,,	Transvaal Launderers' Association.
,,	Witwatersrand Clothing Manufacturers' Association.
June	Engineers' and Founders' Association.
,,	King William's Town Master Builders' Association
,,	Master Builders' and Allied Trades Association, Queenstown.
,,	Transvaal Footwear Manufacturers' Association.
,,	Transvaal Furniture and Upholstery Manufacturers' Association.
July	Johannesburg Commercial Employers' Organization.
August	Cape Engineers' and Founders' Association.
,,	Master Builders' and Allied Trades Association, Griqualand West.
,,	Natal Coal Owners' Society.
September	Cape Wholesale Clothing and Shirts Manufacturers' Association.
,,	Transvaal Merchant Tailors' Association.
,,	Witwatersrand Master Bakers' Association.
,,	Witwatersrand Master Hairdressers' Association.
October	Witwatersrand Mineral Waters Manufacturers' Association.
November	Cape Furniture Manufacturers' Association.

5. **Development of Trade Unionism in South Africa.**—Previous to the Anglo-Boer war, the growth of the trade union movement in South Africa was practically negligible, but towards the close of the nineteenth century, the first branches of some of the international organizations were established, the earliest record being the opening of a branch, in 1881, of the Amalgamated Society of Carpenters and Joiners (now the Amalgamated Society of Woodworkers). Separate typographical societies were in existence at Cape Town and Durban in the early eighties and three branches of the Amalgamated Society of Engineers (now the Amalgamated Engineering Union) were established in 1893 at Durban, Kimberley, and Johannesburg. The Ironmoulders' Society and the South African Engine Drivers' were established in 1896, while in the same year the South African Typographical Union absorbed the various typographical societies into one national union.

In the majority of cases these unions were established by men who had come from overseas, and who, in the case of international organizations, had retained their membership until permission was secured for the opening of local branches. These trade unions did not have much power, nor were their activities very wide-spread until the advent of the industrial upheavals of 1913–1914.

It is interesting to note, however, that in Johannesburg as far back as 1889 a strike took place of the employees of the town engineering shops, when the men demanded a 25 per cent. increase in wages and a reduction of working hours from 54 to 48 hours per week. The strike lasted between three or four weeks. The number of engineering shops at that time in Johannesburg was small; the first to be established was the Old Rand Foundry, which was brought up from Kimberley in 1887.

Several other minor strikes occurred previous to the Anglo-Boer war. The musicians employed at the Johannesburg theatre had a strike in 1897, and about the same time certain building workers employed in building the Johannesburg Post Office went on strike for an increase from £4. 10s. to £5 per week. Another strike of workers employed on buildings occurred about the same time for a similar increase. The two last mentioned strikes only lasted about three hours; the increase being granted in both cases. A strike of mechanics also took place at the Randfontein Estates prior to the Anglo-Boer war.

For a number of years the organized workers in the Transvaal, or more particularly the Witwatersrand, were represented by the Witwatersrand Trades and Labour Council. At the same time the political aspirations of the workers were catered for by an organization known as the Labour Representation Committee. In 1911, the Transvaal Federation of Trades was established to which practically all the representative organizations in existence at that time in the Transvaal became affiliated. This organization to a large extent took over the work of the Witwatersrand Trades and Labour Council, although the Trades and Labour Council continued in existence for about twelve months after the establishment of the federation.

For the first thirteen years of the present century, the trade union movement made slow but steady progress throughout South Africa. In May, 1913, a strike occurred at the Kleinfontein Gold Mine as a result of an attempt on the part of the management to compel five mechanics employed underground to work on Saturday afternoons. This dispute eventually spread and on 4th July developed into a general strike, embracing all classes of workers on the Witwatersrand gold mines; many other industries were also affected. A settlement was finally effected by a conference between three members of the Cabinet and representatives of the Federation of Trades.

The effect of the settlement of this strike on the trade union movement was very marked; the membership of the existing organizations increased rapidly and many new organizations came into existence.

In January, 1914, another upheaval took place in connexion with the strike of railway workers, and on this occasion the Federation was instrumental in calling a sympathetic strike which spread to other centres throughout South Africa.

Simultaneously with the declaration of a general strike on this occasion, martial law was proclaimed throughout certain areas, police and defence units were called up, and the strike collapsed.

As a result of this upheaval the trade union movements suffered a severe set-back, many of the more recently established organizations ceased to exist, and the older unions, including the international labour organizations, lost heavily in membership.

Increased industrial activity as a result of the war, a greater demand for labour and a feeling of discontent on account of the rising cost of living, had its reflex on the trade unions which again became active, and although very small they nevertheless started an energetic campaign of negotiations with the employers which resulted in certain concessions being obtained for the workers.

In 1915, the Transvaal Chamber of Mines recognized for the first time the trade union movement, and a conference was held to discuss certain demands which had been put forward through the South African Industrial Federation on behalf of its affiliated unions. This practice continued so far as the mining industry was concerned right through the war period and until the strike of 1922.

The action of the Transvaal Chamber of Mines in recognizing the trade union movement considerably influenced the position in respect of other employers of labour, and recognition throughout the country became more or less general. Reference boards and joint boards were established for various industries in different centres, and the policy of negotiation was introduced. The constant increase in the cost of living during the latter years of the war, and subsequent to the declaration of peace, caused a considerable amount of unrest, and owing to the ever changing conditions, fresh demands were put forward and negotiations were conducted almost continuously in one industry or another. From the table of strikes attached, it will be seen that during this period the number of disputes leading to strike action continued to increase year by year.

In 1915, there were only 2 industrial disputes recorded throughout the country; in 1916, the number increased to 10; in 1917, there were 22; while in 1918, 23 strikes occurred; in 1919, the number rose to 47. It is worthy of note that during 1919, a number of strikes took place in which native and coloured workers exclusively were involved. In 1920, the high-water mark was reached when 66 strikes occurred in which 105,658 workers were involved and £130,585 lost in wages.

Although the number of strikes increased to such an extent during the period of the policy of negotiation on the mines, there is no question that the system of boards of reference, which had been established, minimized not only the number, but more particularly the duration of these strikes, many of them lasting only one or two days, when a settlement was effected through the board of reference.

Not only did the year 1920 produce the maximum number of strikes, but it also showed a marked increase in membership of the trade unions, while the cost of living continued to rise. During this year severe depression set in, which became more acute towards the end of the year, when the cost of living showed signs of decline, and the first reductions in wages were effected. In the Census returns, the membership of the trade unions and other employees' associations is shown at 31st December, 1920, as 132,754; at 31st December, 1921, this figure had dropped to 107,507. This number was primarily affected by the returns from the National Union of Railways and Harbours Servants which showed a decrease for the twelve months of approximately 20,000 in membership.

Although reductions in wages were being effected, only 25 strikes were recorded during 1921, as against 66 in the previous year. This number still further decreased in 1922, when only 12 strikes were recorded. Included in these is the strike in the Transvaal of the employees of the gold and coal mines, the town engineering shops, and the Victoria Falls Power Company, which finally developed into a general strike resulting in serious disturbances along the Reef and the ultimate declaration of martial law.

As will be seen from the table of disputes attached, 29,001 people were involved in the 12 strikes which took place in 1922, 1,339,508 working days were lost, and £1,817,593 was lost in wages.

As in the case of the 1914 strike, the trade union movement was adversely affected by the strike in 1922. It will also be seen from the table of strikes that following the 1913–1914 trouble, two strikes were recorded during 1915; similarly after the 1922 upheaval, two strikes were recorded during 1923.

From 1911 until 1920, the South African Industrial Federation was generally accepted as the most representative organization in South Africa. During 1920, another organization was formed under the title of the South African Council of Organized Workers. This organization was established with the object of providing a central representative organization which the Government or other bodies might consult for such purposes as the choice of delegates or advisers to represent South Africa at the International Labour Conference or on similar occasions.

After 1920, a number of the most representative trade unions seceded from the South African Industrial Federation. During 1922 and in 1923, an attempt was made to form a new organization, first under the title of the Associated Trade Unions of South Africa, and later under the title of the Co-ordinated Employees' Organization. These attempts, however, did not prove successful.

In 1924, a conference of representatives of all trade unions throughout South Africa was called by the Minister of Labour, in Cape Town, with the object of considering the question of unemployment, and the delegates present also discussed the necessity of establishing a national organization which would be representative of all sections and classes of organized labour. This resulted in the establishment of an organization early in 1925, under the title of the South African Association of Employees' Organizations. This organization at the present moment is the most representative of the organized workers in South Africa.

From 1920 until 1922, the decline in membership of the trade unions was not very marked, but after the 1922 strike and until 1924, the loss in membership was most severe, even in the case of unions which had not been involved in the strike.

With the promulgation of the *Industrial Conciliation Act* of 1924, with its provisions for the registration of trade unions and establishment of industrial councils, interest in the trade unions revived, while in many instances, trade unions have been resuscitated by the assistance of the Department of Labour. Industrial councils have been established and a decided increase in membership will be shown for 1925.

6. **Summary of Industrial Disputes, 1906 to 1925.**—The following table (a) contains a summary of industrial disputes as between the years 1906 to 1925, and (b) a more detailed summary of similar disputes in 1924.

(a) **SUMMARY OF INDUSTRIAL DISPUTES BETWEEN THE YEARS 1906 AND 1925.**

Year.	Number of Strikes beginning each Year.	Number of Workpeople Involved.	Aggregate Duration in Working Days.	Estimated Loss in Wages.
			No.	£
1906	1	49	2,646	1,852
1907	1	6,400	288,000	273,600
1908	—	—	—	—
1909	—	—	—	—
1910	5	421	10,200	10,200
1911	4	860	16,785	9,281
1912	1	884	—	—
1913	5	19,771	89,887	83,749
1914	12	21,927	160,129	136,020
1915	2	—	—	—
1916	10	1,275	1,420	1,095
1917	22	3,457	18,417	9,531
1918	23	2,582	31,786	28,872
1919	47	23,799	537,138	260,409
1920	66	105,658	839,415	130,584
1921	25	9,892	112,357	113,454
1922	12	29,001	1,339,508	1,817,593
1923	2	50	740	960
1924	7	1,856	10,129	20,958
1925*	—	—	—	—

* Several incipient stoppages of work on a very small scale occurred, but owing to the influence of the Industrial Conciliation Act were checked before a strike developed.

NOTE.—In the above table the records up to 1917 are by no means complete, as returns were not then tabulated for all the strikes shown. The latter portion of the table may, however, be accepted as a fairly accurate record.

(b) **SUMMARY OF INDUSTRIAL DISPUTES WHICH OCCURRED IN THE UNION OF SOUTH AFRICA DURING 1924.**

Province, and Date on which Strike Commenced.	Locality and Industry.	Number of Workpeople Directly Affected.		Duration of Strike in Working Days.	Aggregate Working Days Lost.	Estimated Loss in Wages.

7. **Statistics of Trade Unions and other Associations of Employees.**—The following tables give (i) membership of trade unions and other associations of employees for a series of years, and (ii) the distribution of associations of employees and their membership, according to industrial groups, as at the 30th September, 1924.

It was only when the provisions of the *Statistics Act* were applied, in the year 1919, that it was possible to obtain anything approaching complete statistics of employees' associations in the Union. Statistics of trade unions and other associations of employees are now secured annually under the Act.

(i) MEMBERSHIP OF TRADE UNIONS AND OTHER ASSOCIATIONS OF EMPLOYEES IN THE UNION, 1900 TO 1924.

Year.	Membership.	Year.	Membership.	Year.	Membership.
	Number.		Number.		Number.
1900.....	3,836	1916.....	15,367	1921.....	108,242
1905.....	6,343	1917.....	39,152	1922.....	81,861
1910.....	9,178	1918.....	77,819	1923.....	86,865
1914.....	11,941	1919.....	113,797	1924.....	87,147
1915.....	10,538	1920.....	135,140		

(ii) TRADE UNIONS AND OTHER ASSOCIATIONS OF EMPLOYEES IN VARIOUS CLASSES OF OCCUPATION IN THE UNION, NUMBER AND MEMBERSHIP, 30th SEPTEMBER, 1924.

Class of Occupation.	Unions.	Membership.	Class of Occupation.	Unions.	Membership.
	No.	No.		No.	No.

* Concerned with all classes of manufacture.

Federated Associations.	Membership.
Associated Chambers of Commerce.....	96
South African Federated Chamber of Industries.....	6
National Federation of Building Trades' Employers in South Africa	17
Federation of Master Printers of South Africa.....	7

§ 4. Juvenile Affairs.

1. **Legislation.**—*The Regulation of Wages, Apprentices, and Improvers Act* (*No.* 29 *of* 1918), which came into force on 1st October, 1918, provides for the establishment of wages boards, and the regulation of the wages of women and young persons in certain trades and occupations specified in the schedule to the Act. *The Wage Act* (*No.* 27 *of* 1925) repeals this Act, which will cease to operate on the promulgation of the Wage Act.

The Juveniles Act (*No.* 33 *of* 1921) makes provision for the establishment of boards to deal with matters affecting the employment, training, welfare, and supervision of juveniles, and for the supply of certain information to such boards. The Minister of Labour may establish a board for any area in the Union, and appoints the members of any board so established. Such members must be representative of employers and employees, as far as possible in equal numbers. The membership must also include persons of special knowledge or experience in educational matters and social conditions.

It is the duty of the principal of every school situated within the board area before the expiry of one month after the commencement of every school term to furnish the board with written information regarding "school-leavers."

Every employer of a juvenile within a board area is called upon to supply to the board particulars of his own name, address, and occupation, and of the name, age and address of the juvenile employee; also, if the board so requires, the nature of the occupation at which the juvenile is employed, as well as particulars of educational attainments and of any continuing educational course which he may be pursuing. Every employer of a juvenile is further required to notify the board of any cessation of such employment.

Under the Act, "juvenile" is defined as "a person who is under the age of eighteen years, and who was subject to laws relating to compulsory education, but shall not include any classes of persons exempted by the Minister."

Regulations under the Act, prescribing the constitution and functions of juvenile affairs boards, were published in August, 1922.

2. **Training and Employment of Juveniles.**—The realization of the necessity for the establishment of a definite system of training and placing juveniles in employment brought into existence a number of voluntary juvenile advisory boards. The first board was established in the year 1915. Further bodies were established in 1917, and the boards have performed much useful work from their inception. Prior to the establishment of the boards little had been done to develop or co-ordinate the work of preparing and placing boys and girls in suitable employment after their school training.

During the year 1918, the boards devoted considerable attention to the apprenticeship problem, in the belief that some more definite system of indenture could be adopted in many avenues of employment, more particularly the skilled trades, in order that the juvenile section of the population might be given courses of training along definite lines. The educational character of apprenticeship contracts was emphasized and a series of conferences on apprenticeship was held under the auspices of the juvenile boards at Pretoria, Johannesburg, Cape Town, Durban, and Bloemfontein, at which a number of useful decisions were reached.

As the efforts of the boards extended and became more widely known the public in the large centres of the Union recognized more and more fully the significance of their work in its bearing on the future of South Africa. The movement has enlisted the enthusiastic support of social workers, educationists, and employers, and employees in industry, etc.

The demands of these advisory bodies for increased powers and for statutory recognition were met by the passing of the *Juveniles Act*, 1921. That Act was based upon the experience of the boards as voluntary bodies. Under the Act, juvenile affairs boards have now been established at Pretoria, Benoni, the Witwatersrand, Durban, Pietermaritzburg, East London, Port Elizabeth, Kimberley, Cape Town, Grahamstown, and Bloemfontein. Non-statutory juvenile boards function at Kimberley and at Cape Town in respect of non-European juveniles, and are recognized and supported by the Department of Labour.

A function of the boards is to advise parents and children in all matters concerning the employment of juveniles, their careers, welfare, and further education. Employment bureaus are directed to assist juveniles in finding suitable work. Boards also undertake to bring to the notice of the Government, other bodies, and the public generally, the existence of evils, and to suggest remedies in all matters concerning the training and welfare of juveniles. They are also empowered to collect and maintain such statistics, bearing upon the employment of juveniles, as are necessary to enable the problems affecting juveniles to be dealt with on the most advantageous lines.

The work of the boards established under the Act, though up to the present of a preliminary and an exploratory character, has been most useful. As affording some indication of the problems with which the boards are dealing, it may be mentioned that the Government messenger service has been converted from a blind-alley occupation to one giving opportunity of promotion to higher positions, subject to the possession of the necessary educational qualifications; and, with a view to assisting in this direction, facilities

for further education have been provided. The practicability of placing town-bred juveniles in occupations of an agricultural kind has been investigated and a "Farm Lads' Bureau" originally established by the *Sunday Times* subsequently taken over by the Witwatersrand Central Juvenile Affairs Board has been successful in placing a large number of lads as learners in agriculture.

Arrangements have also been completed with the Department of Posts and Telegraphs for the recruitment of a considerable portion of its juvenile labour requirements through the juvenile affairs boards. The commercial community is, to a markedly increased degree, utilizing the services of the boards.

Except at Johannesburg and Cape Town, the juvenile affairs boards at the end of 1925 experienced little or no difficulty in placing in employment ex-Standard VI boys of good character. The improved position is largely attributable to the Government policy of widening the openings for employment on a wage upon which *a civilized standard of life can be maintained.*

Difficulty has been experienced by juvenile affairs boards in finding suitable employment for girls and for the residue of boys who do not possess the requisite standard of education and who are otherwise not acceptable to employers. This aspect of the problem is receiving special consideration, but in some ways presents almost insuperable difficulties.

3. **Juvenile Affairs Conferences.**—Two conferences on juvenile affairs were held at Pretoria by the Department of Labour in 1924 and 1925. Useful work was done on each occasion and a large measure of co-ordination of methods and policy was achieved.

§ 5. Apprenticeship.

1. **Apprenticeship Act.**—Under the provisions of this Act (No. 26 of 1922, amended by Act No. 15 of 1924), apprenticeship becomes in a measure compulsory in such trades as decide, under advisory powers vested in special apprenticeship committees, to adopt its provisions. A trade designated by the Minister on the advice of a committee becomes subject to the law. The State assumes certain responsibilities relative to the performance of the terms of an apprenticeship contract, and undertakes the scrutiny and registration of contracts. Payment of premiums for engagement is forbidden, and minimum and maximum ages for apprenticeship are fixed. Transfer and cancellation of contracts in certain circumstances is provided for. Questions of importance for which provision is not specifically made are dealt with by the Minister on the advice of committees representing groups of trades.

Committees must consist of not less than five members appointed for three years, one of whom is to be a chairman appointed by the Minister, and comprise an equal number of employers and employees. Recommendations of the committees, if accepted by the Minister, have the force of law. The Minister, in consultation with the committees, may prescribe the qualifications required by apprentices in particular trades, though the minimum age and the standard of education are fixed. The Minister may, moreover, fix or vary the periods of apprenticeship, having regard to the age and qualifications of the apprentice. Acting with the advice of committees, he is empowered to fix the number of apprentices who may be employed in given shops and to fix rates of wages payable; to investigate any dispute which may arise out of a contract; and to determine, in consultation with a Government education authority, what continuation classes shall be attended by the apprentice. A schedule to the Act provides a form of contract to be followed as nearly as circumstances will permit, whilst another schedule specifies the industries to which the Act may be applied. The industries so scheduled cannot be altered or varied except by amending legislation.

The *Apprenticeship Act* came into operation on the 1st January, 1923. Regulations under the Act, relating chiefly to the contract of apprenticeship, were published in March, 1923. Under an amending Act (No. 15 of 1924) it was constituted an offence for any person to bring pressure to bear on an apprentice to break the conditions of his contract. A clause in the form of contract of apprenticeship rendering it ineligible for an apprentice to belong to a trade union was removed, and it was provided that an apprentice should not absent himself from his employment without the sanction of the inspector of apprenticeship.

2. **Apprenticeship.**—Prior to the passing of the *Apprenticeship Act*, 1922, apprenticeship in the Cape, Natal, and Transvaal Provinces was legalized under *Masters and Servants Acts*, which permitted the indenturing of apprentices by private contracts enforceable by either party. Those provisions had, however, become unsuitable to modern industrial conditions, and it was desired that a system, having the force and sanction of law, should be devised under which youths, to whom good educational opportunities were offered, could learn to become skilled operatives in industry. It was realized that the employment of skilled tradesmen implied the power and afforded the opportunity to train apprentices, and also that the early stage of such employment was highly educative, since it supplied a course which, in industry, was parallel to the secondary cultural course offered by the

high schools. The view was held that modern apprenticeship must take its proper place in the educative system of the nation, being the only sure method of training skilled workers. To meet the needs of the Union in these several respects the *Apprenticeship Act* of 1922 was passed.

3. **Apprenticeship Committees.**—The following apprenticeship committees have been appointed under the Act:—

Transvaal Engineering Apprenticeship Committee.
Witwatersrand Building Apprenticeship Committee.
Pretoria Building Apprenticeship Committee.
Government Apprenticeship Committee.
Railways and Harbours Apprenticeship Committee.
Cape Division Mechanical Engineering Apprenticeship Committee.
Cape Division Building Apprenticeship Committee.
National Printing Apprenticeship Committee.
Cape Furniture Industry Apprenticeship Committee.
Durban Engineering Apprenticeship Committee.
Durban Building Apprenticeship Committee.
Bloemfontein Engineering and Building Apprenticeship Committee.
Port Elizabeth Engineering and Building Apprenticeship Committee.
Port Elizabeth Building Apprenticeship Committee.
East London Engineering Apprenticeship Committee.
East London Building Apprenticeship Committee.
Queenstown Building Apprenticeship Committee.
Kimberley Building and Engineering Apprenticeship Committee.
Pietermaritzburg Building Apprenticeship Committee.

Both employers and employees are giving the apprenticeship question their wholehearted support, and special attention is being devoted to the technical education of the apprentices. In conjunction with apprenticeship committees, the Union Education Department has, in most instances, settled the syllabuses for the courses of technical education which apprentices under contract are required to attend. In the larger centres, provision is made for the instruction necessary to be given at the local technical institute while, for apprentices in the smaller country towns, the question of instituting correspondence courses is under consideration.

At the suggestion of various juvenile affairs boards attempts are being made to institute some form of voluntary apprenticeship in commerce. At the moment large commercial houses import their more senior assistants from overseas, and pressure is being exerted to obviate this unsatisfactory feature in order to open additional avenues of employment for local juveniles.

4. **Wages of Apprentices.**—The wages payable to apprentices may be regulated by the provisions of the *Apprenticeship Act* or by the terms of agreements arrived at under the *Industrial Conciliation Act.* Such wages may also be defined by wages boards operating under the *Wages Regulation Act*, but these latter agreements are rapidly being superseded by the operations of the Apprenticeship and the Industrial Conciliation Acts.

The following tables show the weekly rate of wages paid to apprentices in the (a) building, (b) engineering, (c) printing, and (d) furniture industries during each year's apprenticeship; as fixed under the provisions of the *Apprenticeship Act.*

(a) BUILDING INDUSTRY.

The nominal period of apprenticeship in the printing industry is seven years, and the educational qualification is Standard VII. However, the period is reduced to six years in the case of an apprentice who has passed Standard VIII, or its equivalent, or the Junior Certificate examination and the commencing scale of pay applied is that of the second year. A boy who has passed Standard X, or its equivalent, or holds the Matriculation Certificate, serves an apprenticeship of five years and commences on the scale of pay applicable to the third year.

Definition of Grades.—For the purpose of wages scales for apprentices set out in table (c) above, the following towns and areas shall constitute the grades:—

Grade A.—The municipal areas of Aliwal North, Burghersdorp, Queenstown, King William's Town, and Grahamstown.

Grade B.—The Magisterial Districts of Paarl and Stellenbosch (including Wellington).

Grade C.—The municipal areas of Worcester, Oudtshoorn, Mossel Bay, George, Knysna, Uitenhage, Malmesbury, and the Magisterial District of Tulbagh.

Grade D.—The Cape Province, excluding those areas specified under Grades I, II, A, B, and C.

Grade I.—The Magisterial Districts of the Cape (including Durbanville), Wynberg, Simonstown, Port Elizabeth, and East London.

The Province of Natal, excluding the Magisterial District of Durban.

The Province of the Orange Free State, excluding the Magisterial Districts of Bloemfontein and Kroonstad.

The Province of the Transvaal, excluding the Magisterial Districts of Potchefstroom, Middelburg, Pietersburg, Standerton, Pretoria, Heidelberg, and the Witwatersrand as defined in Grade IV.

Grade II.—The Magisterial Districts of Kimberley, Hay, Herbert, and Barkly West (Cape Province).

The Magisterial Districts of Potchefstroom, Ventersdorp, and Klerksdorp, as defined in Proclamation No. 242 of 1922.

The Magisterial Districts of Middelburg, Heidelberg Pietersburg, and Standerton. (Transvaal).

The Magisterial District of Kroonstad (Orange Free State).

Grade III.—The Magisterial District of Durban (Natal).

The Magisterial District of Bloemfontein (Orange Free State).

Grade IV.—The Magisterial Districts of Krugersdorp, Johannesburg, Germiston, Boksburg, Benoni, and Springs (referred to under Grade I as the Witwatersrand), and the Magisterial District of Pretoria.

§ 6. Wage and Industrial Legislation.

1. **The Wage Act.**—Act No. 27 of 1925 * provides for the constitution of a Wage Board for the Union to consist of three members with power given to the Government to add two members for any particular inquiry—one to represent the employers and one to represent the employees. In order to expedite the work of the Board, should numerous applications be made, divisions of the Board may be created for *ad hoc* inquiries, but the proceedings do not become effective except as endorsed by the Wage Board itself.

The Wage Board begins to function upon a requisition by the Minister, or on the application of a registered trade union or association of employers, or, where no such registered union or association exists, on the application of employees or employers who satisfy the Board as to their representative character. The proviso is made, however, that where there exist registered organizations of both employers and employees sufficiently representative, the Board shall not proceed with any investigation in respect of such trade unless directed to do so by the Minister. The object of this proviso is to empower the Minister to insist upon resort to the conciliation machinery.

Section 3 (2) of the Act defines the considerations which have to be taken into view by the Board in investigating wage and labour conditions, and section 7 defines the subjects upon which the Minister may make a determination in accordance with any report or recommendation of the Board.

The Act further provides for duties of inspection, for the maintenance of certain records, and for a complete system of co-operation between the industrial inspectors of the Department of Labour and the investigations of the Board, with further co-operation with the Board of Trade and Industries.

* Promulgated on 12th February, 1926.

2. **Economic and Wage Commission.**—On account of the upset of values and confusion resulting from the recent war, it was found necessary to conduct an investigation into matters relating to the wages and earnings of labour and other kindred questions. The position as disclosed in the report of the Economic Commission of 1913 had altered materially, and accordingly on the 4th August, 1925, His Excellency the Governor-General appointed an Economic and Wage Commission consisting of:

Stephen Mills, C.M.G., of Melbourne, Australia (Chairman).
William Henry Andrews, Esquire, of Johannesburg.
Professor Henry Clay, M.A., of the University of Manchester, England.
John Martin, Esquire, of Johannesburg.
Willem Hendrik Rood, Esquire, M.L.A., of Nelspruit, Barberton; with
Charles Edward Lowrey Bell, Esquire, as Secretary, and Louis Hotz, Esquire, B.A., as Statistical Assistant.

On the 21st August, 1925, Mr. F. A. W. Lucas, K.C., the chairman-designate of the Wage Board to be appointed in accordance with the provisions of the *Wage Act* (*No.* 27 *of* 1925), was appointed as an additional member of the Commission.

The Commission was directed to inquire into and report upon wages in the Union of South Africa, and to consider the effect of different wage and labour policies upon the opportunities of employment at a wage compatible with a civilized standard of life, with particular reference to—

(1) the range of wage rates and earnings in the Union;
(2) the differentiation of wage rates according to age, sex, experience, responsibility, and skill and also according to special conditions and terms of service imposed by law;
(3) the procedure by which wage rates are settled;
(4) the relation of money wages to real wages and the adjustment of money wages to variations in the cost of living;
(5) the industrial and commercial conditions affecting the amount of wages;
(6) the effect of wage standards upon the distribution of labour between different occupations;
(7) the influence of public wage regulation upon industrial development; and
(8) the need for wider scope for the youth of the country and the effect of the existing conditions in South Africa upon their opportunities of entry into and training in industrial employment.

Such an investigation was rendered the more necessary in view of the new policy as to wage determinations instituted by the *Wage Act.*

3. **Economic and Wage Commission Report.**—The report of the Commission was published in April, 1926 (U.G. 14 of 1926). The document consists principally of two separate reports signed respectively by Messrs. Mills, Clay, and Martin, and Messrs. Andrews, Lucas, and Rood, with certain reservations in the first case by Mr. Mills and in the second case by Mr. Andrews.

(i) *The Mills–Clay–Martin Report* is divided into five chapters. The first chapter gives a review of existing wage conditions in the Union, the movement of wages in various occupations over a period of years with particular reference to the cost of living and the level of real wages, and a statement embodying a comparison of money wages and the level of real wages in South Africa and a number of centres outside the Union. Stress is laid on the wide disparity of wage rates between different areas and occupations in the Union, and also on the gap between skilled and other classes of wages, and details are shown of wage and labour conditions in smaller urban centres and in agriculture. The exclusion of "Sundries," when the question of wages in relation to the cost of living is under consideration, is recommended. The international comparison of wages is accompanied by estimates of the national incomes of different countries, and the conclusion is reached that the level of urban skilled wage rates is high in South Africa—"far higher than in any European country, higher than in Australia, about as high as in Canada, and exceeded only by the United States of America." When real wages are considered, "the advantage of South Africa over Europe is reduced, but remains considerable, real wages being about 40 per cent. above the highest European level, namely, London," while South Africa falls slightly below Australia and Canada. On the basis of capacity to pay, it is asserted that "the rates of wages in South Africa are relatively far higher than in any other country."

Chapter II deals with the procedure operative in the settlement of wages in the Union, and consideration is given to the question under the headings of (*a*) individual contract, (*b*) collective bargaining, and (*c*) procedure as laid down by statute. In the latter context an analysis is made of the *Regulation of Wages Act,* 1918 (now repealed by the *Wage Act* of 1925), the *Apprenticeship Act,* 1922, the *Industrial Conciliation Act,* 1924, and the *Wage Act,* 1925, and an estimate is made of the objects and effect of these measures. Particular attention is devoted to a definition of the respective spheres within which the two last-named Acts should operate. The suggestion is made that the Wage Board appointed under the 1925 Act should concentrate its activities on the improvement of the wage and

labour conditions in the so-called "sweated" industries, and further that a clear line of demarcation should be drawn, as a matter of administrative practice, between the operations of the two Acts, so that resort from the *Industrial Conciliation Act* to the machinery inaugurated under the *Wage Act*, at the will of discontented parties to an agreement under the former Act, should be discouraged, if not made impossible. At the same time, it is recommended that the Wage Board should be placed in the position of a co-ordinating authority on all questions of wage regulation within the Union, in order that the existing system of conflicting wage policies among different wage-fixing bodies may be eliminated as far as possible.

Chapter III is concerned with the consideration of the various factors which should enter into any system of public wage-regulation, with special reference to the conditions influencing the operation of such a system in South Africa. The general conclusion reached is that policies aiming at the regulation of the level of wages can have only a limited effect, since the determining factor is the volume of production in a country, i.e. the national income, which cannot be directly increased by a system of wage regulation *per se*, though it may be indirectly influenced to its advantage (by an increase in the efficiency of labour) or to its disadvantage (by a dislocation of existing economic conditions and relations). In South Africa, where, it is stated, a relatively low average production is accompanied by a very high average European wage, it is affirmed that a policy of public wage regulation has a considerable measure of justification and social value, while it is pointed out at the same time that the circumstances of the country call for a gradual and cautious application of such a policy of wage-fixing under statutory compulsion.

Chapter IV deals with "the problem of wages in relation to proposals for increasing the scope of white employment." The subject is very fully discussed under the following headings: (1) the alleged lack of openings for white youths; (2) the poor white problem, with which is associated an inquiry into the opportunities of employment as affected by the possibilities of development in agriculture; (3) the enactment of a legislative colour bar; (4) the use of the wage rate as a colour bar; (5) the substitution of Europeans for natives in Government employment; (6) the special case of the gold-mining industry; (7) the economic future of the native; and (8) the fostering of manufacturing industry under a protective tariff. This section of the report is in the main a criticism of all policies which "sought to extend the scope of employment by diverting, and in the process of diversion, reducing the funds created by production, which constitute the source of all employment." Among the policies placed in that category are "the interference with the present labour supply" of the mining industry, the employment of white labour "on an uneconomical basis," "the policy of excluding the native from industrial occupations," and "the artificial stimulation of certain occupations or industries" under the shelter of a State regulated wage or a customs tariff.

Chapter V is devoted to an analysis of the theoretical principles of wage regulation, and embodies a series of propositions designed to serve as a guide to the public authorities charged with the determination of wage minima in the Union. Such conceptions as "the living wage," "a civilized standard of life," and "the subsistence level" are examined and commented upon in the light of the experience of and the ideas current in South Africa and other countries.

The qualifying and supplementary observations made by Mr. Mills, in signing the report, deal with the following points: (1) the relation between an expanding population and the economic development of a country; (2) the respective spheres of operation of the *Industrial Conciliation Act* and the *Wage Act*; (3) native labour policy in the gold-mining industry and its bearing on the general economic development of the Union, with particular reference to the agricultural industry; (4) the economic future of the native; (5) the fostering of manufacturing industries and the promotion of agricultural production; (6) the principles of wage-regulation.

The following is a brief summary of the definite recommendations contained in this section of the Commission's report:—

(1) The Government should undertake a complete survey of the economic condition of the native people.

(2) All areas where large numbers of natives are employed should as far as practicable be proclaimed labour districts and brought under the scope of the Native Labour Regulation Act, the provisions of which serve a useful purpose.

(3) Any conditions imposed upon trade unions, such as insistence on the taking of a secret ballot, should be included among the requirements to be fulfilled before registration of a trade union is effected.

(4) The status of non-registered trade unions requires definition, and strike ballots should be made secret by law.

(5) The chairmen of apprenticeship committees should meet at intervals and endeavour to ensure a measure of co-ordination between apprenticeship rates which at present show great divergences. The Wage Board should be represented at such conferences.

(6) It is highly undesirable that parties to a dispute should be able to appeal from the machinery of the *Industrial Conciliation Act* to the Wage Board.

(7) The Minister before registering or extending an agreement under that Act should review the terms and require them to be redrafted, if necessary, in a form that satisfied his law advisers.

(8) All such agreements should be submitted to the Wage Board, as the chief co-ordinating authority on wage questions, for its comments.

(9) In the case of an industry sufficiently organized to be capable of utilizing the procedure of the *Industrial Conciliation Act*, reference to outside arbitration, including the Wage Board, should be permitted only if demanded by a majority of the employers' and employees' representatives respectively.

(10) The Minister should make a public declaration that he intends freely to use his power to direct the Wage Board to make a recommendation in the case of the lower-wage and unorganized occupations.

(11) The Wage Board should have regard to the rates of pay and conditions of employment in agriculture and in rural areas generally when considering the subject of wages in other industries.

(12) The Public Service Commission should consult the chairman of the Wage Board before making any important wage change in the terms and conditions in the Public Service. The chairman of the Wage Board, or his alternate, should be invited to attend the meetings of the Railway Conciliation Board.

(13) Every Department of State should be required to make an annual return to Parliament showing the estimated additional expenditure incurred as a result of substituting European for native labour.

(ii) *The Andrews–Lucas–Rood Report* is set out in three chapters. Chapter I headed "Wages," dealts *seriatim* with each of the terms of reference, and in effect presents a comprehensive survey, from the point of the view of the signatory commissioners, of the existing wage, labour, and industrial conditions in the Union. The gist of the observations made under each heading may be summarized as follows :—

(1) Payment in kind plays an important part in the wage economy of the Union. The range of wages is extremely wide, varying to a large extent, in the case of Europeans, according to the degree of organization of the employees. Fuller information than exists at present as to actual wages paid, particularly in the lower ranks of industry, is desirable. Agreements under the *Industrial Conciliation Act* have had the effect of raising the level of wages of those concerned. The wage conditions in the smaller centres, so far as they have been revealed by the inquiries of the Commission, are not entirely satisfactory. The rates of wages fixed under the *Wages Act* of 1918 are characterized by a great lack of uniformity and the absence of any apparent general principles ; and even these rates were evaded in many cases.

The wages of coloured workers are on a similar level to those of white workers in the same occupations. Native wages are about the same in the gold-mining industry as those paid on the Natal sugar plantations ; they are most favourable in the case of unskilled labour in the Cape Town area. The wages of Asiatics are on the same level as those of native and coloured workers.

International comparisons of wages, such as are generally made, are without value, since they do not take account of "Sundries." An attempt to compare real wages in Johannesburg and London with the inclusion of "Sundries," places the ratio at 100 to 89.

A comparison of the movement of the national income of the Union between 1917 and 1924 and the movement of wages shows that the wage-earning classes did not participate to the full in the increased national wealth which has accrued to the Union since 1917. Compared with 1910, real wages have declined in every industry except printing ; wage conditions appear to be more favourable now, as compared with the pre-war period, in Port Elizabeth, East London, Durban, Pietermaritzburg, and Bloemfontein, than in the Cape Peninsula, Kimberley, Johannesburg, and Pretoria.

(2) Differentiation of wages occurs in practice according to age, sex, experience, responsibility, and skill ; and certain conditions of service imposed under statute also have the effect of differentiating between the wages of persons engaged in similar occupations, e.g., the *Apprenticeship Act*, some agreements under the *Industrial Conciliation Act*.

(3) Wages are settled by voluntary agreement, by custom or under legislative compulsion. The employer who has to depend on individual bargaining is at a disadvantage. The tribal native who works under contract is in a favourable position in this respect, as he has access to the land. Many natives are, however, becoming detribalized and are losing this advantage. Collective bargaining is the ideal method of fixing wages, where both parties are sufficiently well-organized to be able to negotiate on equal terms. Customary wage rates are best exemplified by agricultural wages.

The statutory regulation of wages is governed by the *Wages Act*, 1918, the *Apprenticeship Act*, 1922, the *Industrial Conciliation Act*, 1924, and the *Wage Act*, 1925. The last-named Act is designed to supplement the *Industrial Conciliation Act*, and it should be used whenever the latter fails. The *Wage Act* requires to be amended in some particulars.

Co-ordination of wage determinations is desirable. The diversity of standards arising from the existence of different racial strata in the Union, together with other factors which are peculiar to South Africa, should receive the careful consideration of the Wage Board in making its recommendations.

(4) "Sundries" should be taken into account for the purpose of wage determinations. High rents are among the chief causes of the high cost of living in South Africa, and the existing system of municipal rating is one of the causes of high rentals. All improvements on land should be untaxed. Housing schemes should be encouraged by liberal State loans made for the purpose.

The value of real wages should not be allowed to fall owing to a rise in the cost of living, and every such rise should be compensated by an adjustment in money wages.

(5) The increase in the national income in recent years has been in advance of the increase in the population. The Government should exercise control over the system of raising capital for investment in the Union, and should borrow locally, if possible, for public purposes. In this way the drain on the national income through interest charges should be reduced.

There is considerable land hunger in South Africa. Access to the land should be made easier and the power of landlords to exact toll from land-users should be curtailed. A scheme for the insurance of farm crops should be established; better marketing facilities for agricultural products should be developed; and a system of loans to producers against the sale of their crops should be introduced. Overtrading and excessive granting of credit are prevailing evils in South Africa, which tend to check economic development.

(6) Differences in wage standards between town and country areas are among the causes of the drift of population to the large urban centres.

(7) "Sweated" wages are to the detriment of the whole community, and lead to inefficiency of management. The public regulation of wages, when it results in raising the lower level of wages, will have a beneficial effect on production. The wage earners should not be called upon to bear the whole burden of carrying on inefficient industries.

(8) The greatest scope for the youth of the country lies in the development of agriculture and the derivative industries. Everything should be done to encourage the development of agriculture and the better utilization of the land, and suggestions are made with that end in view. The juvenile placement organization is serving its purpose admirably and should be developed.

Chapter II discusses the economic relationship between Europeans and natives in South Africa, and traverses in greater detail much of the ground covered in the previous chapter. The importance of the native in the South African economic structure is emphasized, and the development of industry predominantly on the basis of low-paid non-European labour is deprecated. The importation of such labour from outside the Union is strongly condemned, on the ground that it operates to depress the position of the Union native with unfavourable reactions on the standard of living of the white and coloured workers. It is urged that the penal clauses in native labour contract, under the *Masters and Servants Acts* and the *Native Labour Regulation Act*, should gradually be eliminated. It is suggested that the recruitment of native labour for mining and agriculture, which is at present entirely in private hands, should be supplemented by Government labour bureaux, so that natives might go out to work in the greater certainty of reaching congenial employment. Stress is laid upon the necessity for giving the most sympathetic consideration to the grievances of native workers.

Chapter III is devoted to an inquiry into the effect of different wage and labour policies in relation to Union conditions. Reference is made to the traditional European prejudice in South Africa against manual labour, and the emergence of the "poor white" class. The effects of the migration of the latter to the towns are discussed, and attention is drawn to the widespread change in the general outlook on the "poor white" problem. It is declared that the Union is faced with a choice between two alternative labour policies—the importation of increasing numbers of low-paid non-European labourers and the organization of industrial development on the basis of the larger employment of well-paid white workers. The evidence is interpreted as showing that native labour is in reality expensive, and on the other hand that the economical organization of industry with a much larger proportion of better paid whites than formerly is practicable. The encouragement of European immigration to strengthen European civilization in South Africa is advocated. At the same time, natives who have found their way into European industry should be given full scope, and it is mainly when there is a shortage of native labour that advantage should be taken of the fact to adapt industry to the employment of civilized workers. Further importation of native labourers should be discouraged and ultimately stopped, to the benefit alike of the white workers, the coloured people, and the available native labourers, who would be able to improve their economic position.

The principal recommendations of this section of the report may be summarized as follows:—

(1) Agreements of industrial councils should be submitted to the Wage Board before legal effect is given to them.

(2) The Minister's discretion as to the enforcement of recommendations of the Wage Board should be abolished.

(3) The clause relating to " a civilized standard of life " (sub-section 3 of section 3) in the *Wage Act* should be repealed.

(4) Co-operation should be arranged between the Wage Board and the Public Service Commission and the Railway Conciliation Board in wage questions.

(5) A thorough survey should be undertaken by the Government of the wages, food, housing, and other conditions of employees in agriculture.

(6) Buildings should be freed from municipal rates and housing schemes should be rapidly developed.

(7) The share of the landowner, as distinct from the land-user, in the national income should be restricted to the smallest possible amount.

(8) The possibility of easier and cheaper transfer of land should be investigated.

(9) Farmers of good character whose tenure is precarious should be assisted financially, under proper safeguards. A condition in giving such assistance should be that the person assisted bear his full share in the actual work on the land.

(10) The number of agricultural training schools should be increased as rapidly as possible. In signing the second report, Mr. Andrews makes a reservation based on the thesis that the proposals suggested are only in the nature of expedients and that a radical reorganization of society is necessary to effect a permanent improvement in the conditions of the poorer classes.

4. **Workmen's Wages Protection.**—The *Workmen's Wages Protection Act* (No. 15 of 1914) was passed " to make better provision for securing the payment of workmen's wages." It provides generally that wages due to a workman shall form a first charge upon money payable to a contractor by his principal and that assignments and attachments are void as against the claims of workmen.

Other provisions of the Act and particulars of the procedure to be adopted under it are summarized in previous issues of this *Year Book.*

5. **Workmen's Compensation Act.**—An Act (No. 25) was passed by Parliament in 1914, consolidating, amending, and extending throughout the Union the law providing for compensation for injuries suffered by workmen in the course of their employment, or for death resulting from such injuries. By Act No. 13 of 1917 an extension of the provisions of the Workmen's Compensation Act was effected so as to provide for compensation to workmen or their dependents who have contracted, or have died as the result of—

(*a*) cyanide rash,
(*b*) lead poisoning or its *sequelae*,
(*c*) mercury poisoning or its *sequelae*,
while handling cyanide or lead, or using mercury in the course of their employment.

A summary of the provisions of Act No. 25 of 1914 was given in the fifth and previous issues of this *Year Book.*

6. **Factories Act.**—The Department of Labour has taken over the administration of the *Factories Act, No.* 28 *of* 1918, which contains the following provisions :—

(i) *Administration.*—The appointment of a chief inspector, with inspectors under him for various industrial districts. Power of entry is given and full authority to inspect any factory or part thereof.

(ii) *Registration of Factories.*—All factories have to be registered within a period of six months from the date of coming into force of the Act. Registration may be obtained by filling in a prescribed form. An appeal lies to the Minister of Labour against any decision of an inspector in regard to registration.

(iii) *Employment in Factories.*—A record of employees must be kept. The occupier has also to keep affixed in a conspicuous place certain notices, giving the name and address of the inspector, the working hours of the factory, and an abstract of the Act and regulations.

No worker over sixteen years of age may work for more than (*a*) 50 hours a week; or (*b*) 9½ hours a day; or (*c*) 5 hours continuously. No person under sixteen years of age may work for more than (*a*) 45 hours a week; or (*b*) 8 hours a day; or (*c*) 4½ hours continuously (5 hours on half-holidays). All the foregoing hours are exclusive of meal times. The restrictions do not include persons employed in starting motive power in the factory, making preparations for work, cleaning up, or to unskilled work carried on in the open air. A special exemption may be given by the Minister in the case of a factory where the supply of raw material is intermittent, or subject to seasonal variation, or where raw material is liable to deterioration if untreated, or where continuous processes or the exigencies of the business render special hours necessary during certain times or seasons. Women may not be employed between 6 p.m. and 7 a.m., or boys under sixteen years of age between 6 p.m. and 6 a.m., subject to certain exemptions, which may be granted by the Minister, but which may not authorize work between 9 p.m. and 5 a.m.

Overtime is allowed, but for women and for boys under sixteen years of age no overtime may be worked for more than three hours a day on three consecutive days of the

week. In the case of women over sixteen years of age, overtime may not be worked on more than sixty days in a year, and in the case of all children under sixteen years of age on more than twenty days in a year Overtime in these cases is not allowed on holidays or half-holidays, except by permission of the inspector, and when the employees are willing. An overtime register must be kept in every factory.

No female may work in a factory during the four weeks preceding or the eight weeks following her confinement. Provision exists for the payment by Government of an allowance up to £1 per week during the twelve weeks above specified, if the female is solely dependent upon the wages she ordinarily earns, and where the father is unable to support the child.

Children under twelve years of age may not be employed in any factory. Subject to the education law children over twelve years and under fourteen years of age may only be employed when authorized by the inspector. An annual return of such authorizations is required to be rendered to Parliament. Children under sixteen years of age may not be employed in certain specified trades, and may not be employed in any factory without a certificate of physical fitness in prescribed form.

(iv) *Out-Work.*—Where work is given out, a record has to be kept for the guidance of the inspector. No such work may be sub-let, though it may be done by other members of the out-worker's family. The Act provides for a label, which may be attached by the inspector, to be affixed to work given out in connexion with the clothing and textile industries, where the work is performed under satisfactory and sanitary conditions.

(v) *Noxious and Dangerous Occupations.*—Noxious and dangerous occupations may be so declared by proclamation.

(vi) *Holidays.*—Sundays and statutory public holidays are specified. Other days in the year may be substituted. No women or boys under sixteen years of age may work on Saturday afternoons, except when a half-holiday is provided for on some other day of the working week.

(vii) *General Working Conditions.*—Provision is made for proper means of egress in case of fire; for proper sanitation, ventilation, lighting, drinking-water, and such matters.

The following regulations have been framed under the Act:—

Chapter I.—General (Government Notice No. 559/19, *Union Government Gazette*, 2nd May, 1919; amended by Government Notice No. 246/22, *Union Government Gazette*, 10th February, 1922).

Chapter II.—Handling of Hides and Skins and the Sorting of Wool and Mohair (Government Notice No. 2099/20, *Union Government Gazette*, 19th November, 1920).

Chapter III.—Bakehouses and Factories where Foodstuffs are Manufactured, Prepared, or Handled (Government Notice No. 2247/20, *Union Government Gazette*, 17th December, 1920).

Chapter IV.—Transmission Machinery in use in any Factory (Government Notice No. 273/21, *Union Government Gazette*, 18th February, 1921).

Chapter V.—Woodworking Machinery in any Factory (Government Notice No. 1384/24, *Union Government Gazette*, 22nd August, 1924).

An annual report is issued by the Department of Labour for each calendar year, containing full information as to the working of the Act.

Statistics regarding the factories in the Union will be found in the chapter on manufacturing industries (Chapter XVII).

7. **International Labour Organization.**—An account of the International Labour Organization established under the Treaty of Versailles will be found in the sixth and previous issues of this *Year Book*. These also contain particulars of the first four General Conferences held under the auspices of the International Labour Office each year since 1919, the Union being represented at all except the second. The fifth Conference met at Geneva on the 22nd October, 1923, and the sixth on the 16th June, 1924, the Union being again represented at both. Consideration was confined to the question of the general principles which should govern the organization of systems of factory inspection so as to secure the enforcement of laws and regulations for the protection of workers. A recommendation on the subject was adopted.

The following International Labour Conventions have been ratified by the Union Government—

(*a*) Convention concerning the employment of women during the night; and
(*b*) Convention concerning unemployment.

Under the unemployment convention the several labour exchanges in the Union will co-operate with local voluntary advisory committees, the appointment of such committees being specially provided for in the Convention. The exchanges have in the past co-operated with public bodies, and the appointment of committees of the nature referred to aims to bring the position into line with Convention requirements.

The seventh session of the International Labour Conference was held at Geneva, from May 19th to June 10th, 1925. The Union Government was represented by Professor F. Clarke and Mr. W. Freestone, while the employers' delegate was Dr. A. J. Orenstein,

C.M.G.; Mr. H. W. Sampson, O.B.E., M.L.A., represented the employees' organization. The following draft conventions and recommendations were adopted by the Conference :—

Draft Conventions.

1. Concerning workmen's compensation for accidents.
2. Concerning workmen's compensation for occupational diseases.
3. Concerning equality of treatment for national and foreign workers as regards workmen's compensation for accidents.
4. Concerning night work in bakeries.

Recommendations.

1. Concerning the minimum scale of workmen's compensation.
2. Concerning jurisdiction in disputes on workmen's compensation.
3. Concerning workmen's compensation for occupational diseases.
4. Concerning equality of treatment for national and foreign workers as regards workmen's compensation for accidents.

The general question of social insurance was also considered by the Conference.

The report submitted by the Union Government delegates has been published (U.G. 43–25).

§ 7. Wages and Hours of Labour (European Workers).

1. **Introductory.**—From the end of the year 1919 the Statistics Office has undertaken the collection of statistics of wages, hours of labour, trade unionism, and cognate matters in the Union on a regular and comprehensive plan. Prior to that year no systematic or complete record had been maintained. The task of collecting and compiling statistical data over a long series of past years was one of magnitude, particularly as such data could not be obtained under statutory authority but only by enlisting the assistance and co-operation of representative employers of labour and others. With the application of the *Statistics Act* it became possible to put the annual collection of statistics of wages and other aspects of industrialism on a satisfactory and sure basis. The methods followed in inaugurating the system and in obtaining and computing results for back years are set out in detail in the reports on wages, etc., published in the "Social Statistics" series (S.P. 23, 1921, and S.P. 35, 1922) issued by the Statistics Office.

2. **Scope of Inquiry.**—The following groups of occupation are utilized in the computation of average wages and index numbers :—

I.—Mining.
II.—Engineering and Metal Working.
III.—Building.
IV.—Printing, Bookbinding, etc.
V.—General Manufacturing.
VI.—Transport and Communication (Railways, Harbours, Tramways, and Posts).
VII.—Trading.
VIII.—Clerical (Government, Municipal, and Other).
IX.—Domestic (Hotels, etc.).
X.—Miscellaneous (including Police).

Wage rates payable to Europeans (male and female) for full-time work, in a range of specific occupations under these ten groups of industry, are obtained in respect of each of the nine principal industrial centres of the Union, and in the case of occupations in manufacturing industry in respect of certain areas outside those centres. Wage data of coloured persons and natives were not called for at the initial investigations, but were ascertained for the first time in the year 1921.

3. **Methods of Collection and Computation.**—A statement on the methods of collection and computation adopted in the wage statistics inquiry was given in the sixth issue of this *Year Book*. Substantially the procedure is still the same, except that from the year 1923 the date for which ruling wage-rates are collected was changed from the 31st December to the 30th September.

4. **Variations in Nominal and Effective Wages.**—The term *nominal wage* is used to signify the actual amount of money which would be received in return for labour for the full number of hours per week, whether full time is actually worked or not. By *effective wage* is meant a wage equivalent in purchasing power, i.e. purchasing power according to the definite regimen utilized for the calculation of price indexes under the *Statistics Act*. It should be noted that in calculating effective wages the factor of unemployment has not been taken into account for the reason that complete statistics of unemployment have not up to the present been obtainable in the Union. Nominal wages are specified in the tables below from 1895, effective wages from 1910.

The following tables (i) to (vii) give particulars and index numbers of nominal and effective wages in ten groups of occupation in nine industrial areas, for a series of years up to and including the year 1924. The figures from 1919 to 1922 relate to the 31st December, and those for the years 1923 and 1924 to the 30th September :—

(i) AVERAGES OF NOMINAL WEEKLY WAGE RATES—EUROPEAN ADULT MALE WORKERS IN NINE TOWNS IN THE UNION FOR ALL CLASSES OF OCCUPATION, 1895 TO 1924.

NOTE.—" Nominal Wages " represent the actual amount of money received in return for labour, working recognized hours at full time.

Artisans in Railway Employ*.....	18 0	18 9	19 4	20 4	21 6

* Blacksmiths, boilermakers, brassfinishers, bricklayers, cabinetmakers, carpenters, coachbuilders, coppersmiths, electricians, farriers, fitters, French-polishers, harnessmakers, wood machinists, masons, iron and brass moulders, painters, patternmakers, plasterers, plumbers, printers, sawyers, sheet-iron workers, shipwrights, tinsmiths, trimmers, turners and machinists, and wheelwrights.

NOTE.—The Cape Peninsula, Port Elizabeth, East London, Pietermaritzburg, and Durban are in District I; Kimberley is in District III; Bloemfontein is in District IV; and Pretoria and the Witwatersrand are in District V.

7. **Comparison between Wages in South Africa and in Other Countries.**—An attempt is made here to institute a definite comparison between wages paid in South Africa and those paid in the United Kingdom, Canada, Australia, and New Zealand. For this purpose the building trade has been chosen for the following reasons :—(i) The average wages paid in this trade in South Africa approximate very closely to the general average of all trades and apparently are almost equally typical of the average in other countries; and (ii) better and more directly comparable statistics are available for this trade than for others.

The arithmetical average of the wages paid to bricklayers, masons, carpenters and joiners, plumbers, plasterers and painters in the principal towns has been computed. Labourers have been omitted in all cases, on account of the difficulty of comparing South African native labour with the European labour of other countries. For the Union the average of the nine principal towns has been taken, for the United Kingdom the average wages published from time to time in the *Ministry of Labour Gazette*, for Australia the average for Sydney and Melbourne, for Canada the average of thirteen cities, and for New Zealand the average of the four principal industrial districts.

The results are as follows :—

(i) **WEEKLY WAGE RATES—MALE ADULT EUROPEAN WORKERS IN THE BUILDING INDUSTRY IN SOUTH AFRICA AND OTHER COUNTRIES, 1910 TO 1924.**

Country.	1910 (Average).	1914 (Average).	December, 1921.	December, 1922.	1923.	1924.
	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.
South Africa...	97 0	100 7	156 4	135 3	135 1 (Sept.)	135 1 (Sept.)
Australia.....	64 2	70 5	107 7	105 2	109 3 (Dec.)	112 11 (Dec.)
*Canada.....	88 10	97 10	163 7	154 5	160 2	164 5
†New Zealand...	63 10	66 8	98 9	104 3	96 1	97 1
United Kingdom	—	39 5	86 10‡	71 10	69 0 (Sept.)	73 2 (Sept.)

* Average for the year in each case. † 31st March in each case. ‡ February, 1922.

Comparative figures of price indexes of food, fuel, light and rent have been calculated for the different countries, and will be found in Chapter VI. Utilizing these two sets of figures in combination, the following table of international comparisons is given, showing the real value of the wages paid as opposed to the nominal wages detailed in the above table (South Africa in 1910 = 1000).

It should, however, be noted that the figures of price variations have been calculated for December in the years 1919 to 1922 and have been applied to the wage figures given in the above table, which in some cases are for different dates (as shown). From the year 1923 cost of living figures for the months mentioned have been used in making the calculations.

(ii) **INDEXES OF REAL WAGE RATES IN BUILDING INDUSTRY IN SOUTH AFRICA AND OTHER COUNTRIES, 1910 TO 1924.**

(South Africa in 1910 = 1000.)

Country.	1910 (Average).	1914 (Average).	December, 1921.	December, 1922.	1923.	1924.
South Africa....	1000	962	1195	1067	1060 (Sept.)	1051 (Sept.)
Australia.....	951	891	959	956	948 (Dec.)	982 (Dec.)
Canada.....	1134	1100	1306	1248	1278	1324
New Zealand....	982	909	938	1066	938	909
United Kingdom	—	702	821	736	742 (Sept.)	793 (Sept.)

It must be emphasized that no account has been taken of the prices of commodities and services other than food, fuel, light and rent, which in the Union have exceeded the increases above indicated, and which, in so far as they have been similarly affected in other countries, would, if taken into account, tend to reduce the figures in table (ii) as far as post-war years are concerned.

8. **Overtime.**—Rates of payment for time worked in excess of ordinary working hours exist in respect of skilled crafts, tramway occupations and other employment in the Union. These rates are in most cases based upon standard rates of wages and usually comprise

" time and a quarter," " time and a half," or " double time " applicable to weekday, Sunday, and public holiday overtime with greatly varying incidence. In some cases, for example, " time and a half " is payable for weekday overtime worked, in others for Sunday time, and in yet others for time worked on public holidays. The overtime rate in certain instances increases for work performed after midnight. In certain classes of occupation overtime rates apply after the normal hours have been worked on any one day ; in others only after the normal weekly hours have been worked.

9. **Average Wages of European Female Workers.**—The subjoined tables give particulars of average weekly wages paid to European female employees in the Union during a series of years. The figures from 1919 to 1922 relate to the 31st December, and those for the years 1923 and 1924 to the 30th September :—

AVERAGE WEEKLY WAGE RATES—(UNWEIGHTED) EUROPEAN ADULT FEMALE WORKERS IN NINE TOWNS FOR ALL CLASSES OF OCCUPATION, 1910 TO 1924.

(*a*) ALL OCCUPATIONS.

* Includes estimated value of board and lodging, and in some cases board only.

10. **Hours of Labour of European Employees.**—The hours of labour worked by Europeans in the various occupations and branches of industry in the Union have of recent years tended toward greater uniformity. The International Labour Conference at Washington recommended a 48-hour week; and except in relatively few instances the terms of that recommendation apply to industrial conditions in South Africa. Further particulars on the subject will be found in the sixth issue of this *Year Book*; the position is not materially different at the present time.

11. **Awards by Wages Boards.**—Awards have been made in various localities under the *Regulation of Wages, Apprentices and Improvers Act*, 1918. The responsible Minister may appoint wages boards for trades and occupations scheduled in the Act. Boards are composed of equal numbers of employers' and employees' representatives, chosen in consultation with their organizations and presided over by an independent chairman, generally the local magistrate. They are empowered to fix minimum rates of wages for women and young persons in certain trades and occupations set forth in a schedule to the Act, as well as to determine the rates of wages of apprentices and the proportion of apprentices to journeymen in any cases not provided for by the *Apprenticeship Act* of 1922, and the schedule to the latter Act. Inspectors of labour are, for their districts, inspectors under the *Wages Act*. They report on applications for wages boards and make recommendations. If a board is established it is the duty of the inspector to see that its findings are given effect to, and to investigate complaints. For these purposes certain powers are provided in the Act. Fourteen wages boards were in existence on the 1st October, 1925, five having lapsed since 1923.

§ 8. Wages and Hours of Labour (Non-European Workers).

1. **General.**—The ratio of coloured to European labour varies largely in different industries and fields of employment in the Union, but in occupations as a whole the non-European element preponderates to a considerable extent. In the gold mining industry of the Witwatersrand, for example, there were in December, 1924, approximately 180,000 native workers to 18,000 Europeans. In coal mining and in manufacturing industry the coloured and native elements in employment are very much greater than the European. The bulk of general labouring work in agricultural and pastoral operations is non-European; while in municipal employ at the principal industrial centres approximately five coloured and native persons are employed to every two Europeans. These and similar circumstances in relation to employment and its distribution in the Union must be remembered when wage statistics are examined. The average rate of wages of coloured persons, other than native labourers, employed on the Witwatersrand gold mines in certain defined occupations underground is approximately one-fourth of the amount earned by Europeans. The average earnings per shift of all native labourers, surface and underground, in September, 1924, were 2s. 3d. per shift plus free quarters and food, estimated to cost 11d. per shift. Except in the case of diamond mines in the Transvaal and mines in the Cape, where housing only is provided, it is general for mining companies to provide their coloured employees with free quarters and food. The average earnings of surface and underground native labourers and others in the diamond mining industry, as at the 30th September, 1924, were Transvaal 81s. 9d. per month, Cape Province 77s. 8d. per month, and Orange Free State 65s. 9d. per month.

In skilled crafts, as, for example, the engineering, building, and printing trades, many coloured workers in such centres as the Cape Peninsula, Port Elizabeth, and Durban, though relatively few in number to the total of European artisans, have attained a degree of skill which enables them to command wages very little below the standard rates ruling for European workers, although figures reflecting accurate averages cannot be given. In the Cape Peninsula a number of coloured craftsmen in the printing trade receive the same rates of wages as their European fellow-workers. In the manufacturing industries varying degrees of skill have been reached by coloured employees. Considerable skill in furniture-making has been attained by coloured workers at Cape Town and Durban. Tailoring occupations in the Cape Peninsula followed by Malays and other coloured workers are, comparatively speaking, reasonably well paid. In occupations connected with retail trading coloured employees in some centres perform semi-skilled occupations as packers and storemen. In the inland Provinces the occupations of non-European workers are almost exclusively unskilled.

2. **Average Rates of Wages of Non-European Workers.**—Statistics of average wages of non-European workers, in association with figures reflecting broadly the extent of non-European as compared with European employment, are essential to a proper examination of the wage question in the Union. Wage averages of non-European workers employed in different groups of occupation were collected for the first time in 1921.

The wages of non-European females vary so widely that the computation of anything in the nature of reliable averages is impracticable. In the coastal Provinces coloured females follow certain occupations connected with printing and with manufacturing industry, and are also in domestic and hotel employ. In the inland Provinces female labour, largely confined to aboriginal native females, does not occur to any appreciable extent except in domestic service.

The subjoined table gives particulars of average weekly rates of wage paid to coloured and native male unskilled workers in certain industrial areas as at the 30th September, 1923. It will be observed from the figures that the highest averages are in respect of the Cape Peninsula, owing to the relatively higher level of skill and semi-skill reached by coloured workers in that area.

AVERAGE WEEKLY RATES OF WAGE PAID TO COLOURED AND NATIVE MALE UNSKILLED WORKERS IN CERTAIN INDUSTRIAL AREAS IN THE UNION, 30th SEPTEMBER, 1924.

3 **Hours of Labour of Non-European Employees.**—Some particulars in this connexion are given in the sixth issue of this *Year Book*.

§ 9. Miners' Phthisis: A Problem of Labour.

1. **General.**—The history of miners' phthisis legislation, commencing with Act No. 34 of 1911 up to and including the consolidating Act, No. 40 of 1919, has been traced in previous issues of this *Year Book* (Nos. 1 to 6), to which reference may be made for a summary of these enactments. Recent legislation includes amending Act No. 35 of 1924 and consolidating Act No. 35 of 1925. The latter Act consolidates all legislation on the question of miners' phthisis, and makes certain additional provisions for beneficiaries and their dependents. A résumé of both Acts and a statement in parallel columns showing the extent of the principal changes as between the Act of 1919 and the Act of 1925 are published at page 247 *et seq.* of the present volume. The administration of the miners' phthisis law is vested in the Miners' Phthisis Board, to which is attached the Miners' Phthisis Medical Bureau, functioning in association with the South African Institute for Medical Research, Johannesburg.

At the 31st March, 1925, there were 1,190 miners, of average age of 46·88 years, in receipt of allowances during life averaging £12. 6s. 1d. per mensem; of these, 881 were in receipt of additional allowances, averaging £2. 9s. 5d. per mensem, in respect of their wives, whose average age was 40·51 years. Additional allowances, averaging £1. 2s. 1d. per mensem, were being paid to miners in respect of 1,962 children, whose average age was 9·57 years. Further, there were 1,447 dependents of deceased miners (excluding children, but including 1,414 widows), of an average age of 46·21 years, in receipt of allowances during life averaging £4. 17s. 10d. per mensem, and additional allowances averaging £2. 6s. 3d. were being paid in respect of 2,923 children of an average age of 11·44 years.

At the 31st March, 1925, an aggregate amount of £7,202,261 had been paid as compensation to and in respect of silicosis and tuberculosis sufferers under the Miners' Phthisis Acts since the inception of miners' phthisis legislation in 1911; the amount so paid, since the 1919 Act came into operation, being £3,945,998.

2. **Cases dealt with under Phthisis Acts.**—The table hereunder gives the numbers of cases dealt with under the Miners' Phthisis Acts in which awards have been made, distinguishing between persons born in South Africa and those born elsewhere; and the section of the particular Act under which the awards have been made:—

N.S.—No silicosis.
S.—Silicosis in the ante-primary stage or physically unfit for underground work by reason of the presence of silicosis, though not in either the primary or the secondary stage.
S1.—Silicosis in the primary stage with or without tuberculosis.
S2.—Silicosis in the secondary stage with or without tuberculosis.
T.—Tuberculosis without silicosis.

* Similar data for earlier years (to 1912–13) are given in the sixth and previous issues of this *Year Book*.

5. **Revenue and Expenditure under Phthisis Acts.**—The subjoined table gives particulars as to revenue and expenditure of the Compensation Fund under the Miners' Phthisis Acts for a period of years. The cost of administration during the year 1923–24 amounted to £44,184.

Under section 9 (1) of the *Miners' Phthisis Act*, 1919, the Insurance Fund (see previous issues of this *Year Book*) was merged in the Compensation Fund.

§ 10. Recent Phthisis Legislation.

1. **The Miners' Phthisis Act Amendment Act, No. 35 of 1924.**—Act No. 35 of 1924 came into operation on the 1st of August of that year and amends the Miners' Phthisis Act, No. 40 of 1919. It provides mainly for :—

(*a*) The creation and maintenance of an outstanding liabilities fund and the purpose for which this fund is to be used.

(*b*) The quarterly levies on employers to be assessed : 30 per cent. in proportion to the earnings of the miners employed and 50 per cent. in proportion to the employer's silicosis rate instead of 45 per cent. and 35 per cent. respectively ; the 20 per cent. in proportion to the amount for which the employer was assessed for normal income tax remains unaltered.

(*c*) The silicosis rate of the employers to be ascertained by adding together the periods of employment on scheduled mines during the preceding ten years (instead of five years) of all miners who, during the preceding twelve months, have developed silicosis in a stage entitling them to benefits ; at the same time the silicosis rate is to be reduced in exceptional cases.

(*d*) The determination by an actuary of the amount of the outstanding liability in respect to each scheduled mine which amount shall become due and payable, immediately, should the mine be closed down or withdrawn from the list of scheduled mines.

(*e*) The investment, subject to the sanction of the Minister, of the Board's surplus funds in municipal stock, loans to local authorities, or in Rand Water Board Stock, in addition to Union Government Stock, Union Treasury Bills, and fixed deposits with a bank.

(*f*) Such additional benefits to a miner or his dependents, as the miner would become entitled to if he had made application within the period prescribed by the proviso to section 25 of Act No. 40 of 1919, provided the miner ceased underground work within three months after he was notified for the first time that he had developed silicosis in a stage entitling him to benefits.

(*g*) Benefits to a prior law beneficiary miner or his dependents under Act No. 40 of 1919, as if such prior law benefit had not been granted, provided the miner *lawfully* worked underground on scheduled mines after the grant of such prior benefits.

(*h*) The extension of the period prescribed by section 28 (2) of Act No. 40 of 1919 within which the miner should have returned to South Africa before certain benefits could be granted, if the delay in his return was due to his being on active service, being engaged on work of national importance, or by reason of any other circumstances arising out of the 1914–18 war.

(*j*) The appointment of a joint medical board to examine miners who went on active service and were refused benefits under both the Miners' Phthisis Acts and the War Special Pensions Act, No. 42 of 1919, and for benefits to be granted under either of the above-mentioned enactments in accordance with the decision of the joint medical board.

(*k*) Awards made out of the Consolidated Revenue Fund of the Union to dependents of prior law beneficiary miners whose deaths took place too late to enable their dependents to apply before the 1st August, 1920, as required by section 29 of Act No. 40 of 1919, to be deemed to be awards lawfully made under paragraph (*b*) of the said section, the amount paid under such awards to be refunded to the Consolidated Revenue Fund from the Compensation Fund.

Dependents who claim under section 29 (*b*) of Act No. 40 of 1919, to apply within one year of the date of death of the miner and, if the prior law beneficiary miner was in receipt of or entitled to a life allowance, the dependents to be granted a life allowance without the Bureau having to certify that silicosis was a contributing or predisposing factor in the causation of the death of the miner; the other conditions of section 29 (*b*) of Act No. 40 of 1919 must still, however, be complied with.

(*l*) One sum payments (equal to twenty-four times the monthly allowance) to widows who remarry and are in receipt of a life allowance.

(*m*) Awards in terms of section 29 of Act No. 40 of 1919, to widows who are South Africans, who married miners in South Africa and who left South Africa with their late husbands and were thus not entitled to benefits under the section mentioned owing to their not being resident in South Africa at the date of the miner's death, provided the widows returned to South Africa within two years of the date of death.

(*n*) Refund of amount deducted, in terms of section 37 of Act No. 40 of 1919, from monthly allowances granted to dependents and that no further deductions be made; the section mentioned provided for the recovery of amounts paid under section 11 of Act No. 44 of 1916 (or any amendment thereof) from the award made under Act No. 40 of 1919.

(*o*) Additional allowances to and in respect to children in excess of three and under sixteen years of age in cases of life allowance awards and no allowance to be payable to a miner for his wife or child of a marriage contracted after the date of the Bureau's certificate entitling him to a life allowance; Act No. 40 of 1919 provided for additional allowances for children not exceeding three and under sixteen years of age and for an allowance to a miner for his wife if he was married to her before the date of the life allowance award.

2. **Miners' Phthisis Acts Consolidation Act, No. 35 of 1925.**—*Part I: General.*—Act No. 35 of 1925, which repealed Miners' Phthisis Act, No. 40 of 1919, and the amending Act, No. 35 of 1924, consolidated the whole of the laws relating to miners' phthisis, and is in many respects the expression of many years' observation and experience of silicotic conditions in the gold mining areas along the Witwatersrand.

The new Act provides for the publication in the *Gazette* of a list of mines, termed *scheduled mines*, in the Union in which mineral dust is considered to be a cause of silicosis, and also for the addition or withdrawal of mines from the list as circumstances may determine.

Miners' Phthisis Board.—Provision is made for a new Phthisis Board, which will assume control of all assets, property, documents, etc., in possession of the previous Board, and have the power to call witnesses, whose failure to appear without reasonable excuse is a penal offence.

The functions of the Board are—

(*a*) to carry to completion the uncompleted work of its predecessor;
(*b*) to administer all funds placed at its disposal;
(*c*) to provide for the training of beneficiaries in trades or industries;
(*d*) to assist in obtaining employment for such as are trained;
(*e*) to give financial assistance to any undertaking in which beneficiaries or dependents of beneficiaries are employed;

(*f*) to co-operate with any institution, Government or municipal department employing beneficiaries;
(*g*) to assist in defraying reasonable expenses of transport of beneficiaries to places where employment may be available;
(*h*) to assist financially in establishing and maintaining one or more sanatoria for silicotic patients; and
(*i*) to collect and tabulate statistical data relating to the incidence or cause of silicosis and tuberculosis.

Medical Bureau.—This Bureau is established to work in conjunction with the Board, and its decision on purely medical questions must be accepted. Its functions are to direct all prescribed medical examinations and to issue certificates under the Act.

Medical Board of Appeal.—Any miner who is dissatisfied on medical grounds with the certificate of the Bureau or with the results of any examination for benefits; or if a dependent is dissatisfied with the decision of the Bureau as to the cause of a miner's death, an appeal may be lodged with the Medical Board of Appeal, which consists of three medical practitioners with special knowledge of respiratory diseases. This Appeal Board, whose decision is final, is empowered to call for all records in the case, and may subject the appellant to clinical and, if necessary, X-ray examination.

Part II: Grant of Benefits—Miners.—Subject to certain specified conditions, a miner who—

(*a*) is found to be suffering from silicosis in the ante-primary stage may be granted a one-sum benefit, calculated upon his month's earnings, or
(*b*) is found to be suffering from silicosis in the primary stage, as in (*a*), with an addition of 50 per cent.
(*c*) A miner who has contracted silicosis in the secondary stage, or tuberculosis with silicosis, is entitled to payment of a monthly allowance, calculated upon—
(i) half of that part of his month's earnings which did not exceed £20;
(ii) one-quarter of that part of his month's earnings which exceeded £20 but did not exceed £28. 6s. 8d.;
(iii) one-twentieth of that part of his month's earnings which exceeded £28. 6s. 8d.

For his wife, if the miner were married before the 1st August, 1919, or before the date of the Bureau's certificate entitling him to an award of a monthly allowance—
(iv) one-fifth of the total amount payable in respect of the miner.
For each of his living legitimate children (including adopted and step-children), not exceeding three in number, until such child attains the age of sixteen years or marries earlier—
(v) one-tenth of the total amount paid in respect of the miner;
and for each child in excess of three—
(vi) one-twentieth of such amount.

No allowance is granted for more than three children for any period prior to the 1st August, 1924, and a child of a miner over sixteen years of age, if unable to earn a living by reason of ill-health, may continue to draw an allowance at the option of the Board.

A miner who has been granted a one-sum benefit may leave the whole or part to his credit with the Board and receive interest on the amount added half-yearly.

Dependents.—Benefits are granted to the dependents of deceased miners who were in receipt of or entitled to a monthly allowance or whose death was proved to the satisfaction of the Board to have been due to silicosis or other cause in which silicosis was a contributing or predisposing factor—

(i) to a widow or child, double the amount prescribed for the wife or child;
(ii) to a dependent wholly relying upon the miner for support, double the amount prescribed for a wife;
(iii) to a dependent partially relying upon the miner for support, a monthly allowance, subject to certain conditions, equal to the average monthly contributions of the miner, for such period as the Board may determine.

Prior Law Awards.—A miner who has only received benefits under the prior law and is certified by the Bureau to be suffering from silicosis in the secondary stage or tuberculosis with silicosis, may, subject to certain residential qualifications, be granted a monthly allowance under the Act, or, if he be not entitled to such allowance, the Board may award a benefit in such instalments as it may decide, after deducting the benefits already received from the maximum amount of £750.

Miners who have received benefits under the prior law and who are certified by the Bureau to be suffering from silicosis in the ante-primary or primary stage may receive compensation in such instalments as the Board may direct, but the total amount of the award, including the benefits received under the prior law, may not exceed the amount of the benefits for similar silicotic conditions under the Act.

The claims of dependents of such deceased miners to increased benefits under the Act, and of dependents whose claims were refused on the grounds that they were not in necessitous circumstances, may now be submitted for the decision of the Board.

Residential Qualifications.—The Board in its discretion may award a monthly allowance to a widow and/or child of a miner who died outside South Africa, if the residential qualification be the only hindrance to the grant, provided the widow was born and married to the miner in South Africa, or was resident in South Africa for a continuous period of at least five years prior to the miner's leaving the country, and, further, that such widow and/or child returned to South Africa within two years of the death of the miner and had thereafter continuous residence. Such grant ceases and determines should the person subsequently leave South Africa without permission of the Board, granted for temporary purposes only, or outstays such permission.

If the Board is, however, satisfied that any person has been prevented from returning to South Africa or from submitting his claim within the prescribed period owing to his being on active service, or through other circumstances arising out of the 1914–18 war, the time may be extended as seems equitable.

The monthly benefits accorded to a miner or his dependents resident outside South Africa ceases when the total amount of £750 has been paid.

Military Service Claims.—A miner who has been refused compensation under the War Special Pensions Act, No. 42 of 1919, on the ground that his disablement at the conclusion of his military service was due to his occupation as a miner, may claim to be examined by a joint medical board, whose decision is final, and in the event of the disablement being considered occupational, the miner is entitled to receive benefits appropriate to his case under Act No. 35 of 1925.

Marriage of Beneficiaries.—A widow or dependent (other than a child under sixteen) of a deceased miner in receipt of a monthly allowance who remarries or marries is entitled to a one-sum payment on marriage with the limitation that the total benefit does not exceed £750.

Inspectors of Mines.—Officials of this class certified to be suffering from silicosis, and their dependents, are entitled to phthisis benefits, in addition to any benefits accruing to them under any pension statute.

Native Labourers.—The compensation payable to native labourers found to be suffering from silicosis is as follows:—

(i) Ante-primary stage: a one-sum benefit calculated upon his month's earnings.
(ii) Primary stage: 50 per cent. additional of the above amount.
(iii) Secondary stage or tuberculosis with silicosis: 100 per cent. additional of the above amount.

Provision is made for the periodical medical examination of native labourers, and in the event of a native labourer's death from silicosis or tuberculosis for the payment of benefits to his dependents.

Part III: Funds.—All moneys received are paid into the Miners' Phthisis Compensation Fund established under Act No. 19 of 1912, and the funds are applied to certain specified purposes. Provision is made for an appropriation not exceeding £4,000 each quarter for the purpose of forming a Trades and Industries Fund. The Settlement and Industries Fund hitherto existing is closed and its assets and liabilities carried to the Compensation Fund.

The Board is empowered to levy upon the employers of scheduled mines an amount proportionate to the silicosis rate of each mine, and the employers are required to transmit to the Board a statement of the earnings of the miners employed.

Medical Examination.—A medical examination of underground employees of a scheduled mine is prescribed to take place at intervals of not less than six months—natives, not less than three months—to whom a certificate must be issued stating whether or not the worker is suffering from silicosis and in what stage.

All workers before being employed underground must submit themselves to a medical examination conducted by the Bureau.

Part IV: Mines Closing Down.—The liability, which forthwith becomes due, of scheduled mines ceasing operations for payments to the Compensation Fund to cover present and future silicotic claims is determined by an actuary appointed by the Minister.

Liability of Open Mines.—An actuarial calculation of the liability of the fund is made annually, and the amount ascertained apportioned amongst the employers. The Bureau may require security for the payment of such amounts, and failing satisfactory security, may demand payment of the whole outstanding liability. In default of payment of any amount due, the Board may recover from the employer by action in a competent court.

Insolvent Employers.—The Board's claim for moneys due from an insolvent estate has priority over all other debts (including mortgages, debentures, etc.) except wages.

Board's Control of Awards.—The Board may pay to the dependents of beneficiaries who are incapable of managing their own affairs, or for other reasons, such instalments of allowances or benefits as it may from the circumstances of the case decide.

Payment of Passages.—The Board may grant a passage, together with a sum for incidental expenses, to a miner and/or dependents who may wish to proceed overseas for other than temporary purposes. The monthly allowance, however, ceases if and when the total amount of benefits paid exceeds £750.

Hypothecations.—Benefits under the Act cannot be assigned or hypothecated, nor are they liable to attachment under a judgment or order of court.

Gazetted Mines.—Provision is made for a levy upon mines which are not *scheduled* mines, the names of which the Minister may publish in the *Gazette*, and for the payment of benefits to miners and native labourers who have contracted silicosis or tuberculosis while employed on such mines.

3. **Phthisis Acts, 1919 and 1925.**—The Phthisis Acts of 1911, 1912, 1914, 1916, 1917, and 1918 provided fixed but arbitrary amounts for the different stages of compensation, which under these Acts was more or less of an experimental nature. Act No. 40 of 1919 consolidated and amended the prior Acts and provided a more uniform basis of compensation, at the same time imposing upon the scheduled mines practically the sole liability for the maintenance of the Compensation Fund. Amending Act No. 35 of 1924, *inter alia*, made alterations in the scale of assessment, fixed certain financial control of surplus funds, and extended the scope of the benefits in certain directions to correct and meet new conditions which had arisen. Act No. 35 of 1925 consolidated and amended the whole existing legislation on the subject of miners' phthisis. The following parallel statement gives some of the more important provisions of the 1919 Act, and compares them with the principal amendments of similar clauses which have been introduced in the Act of 1925. A *prior* law beneficiary miner, mentioned in the text, is a miner who received benefits prior to the 1st August, 1919, and a *present* law beneficiary miner one who received benefits on and after that date.

Act No. 40 *of* 1919.	*Act No.* 35 *of* 1925.
The Act of 1919 provided compensation based on the miner's earnings.	The Act of 1925 also provides for compensation based on the miner's earnings.
The Act of 1919 gave a miner three months' time within which to cease work and claim his compensation, and reckoned from the date he was certified to be entitled.	The Act of 1925 also gives the miner three months' time to cease work, otherwise he debars himself from further benefits should he afterwards progress into another stage.
The Act of 1919 gave the miner one month within which to appeal from the decision of the Medical Bureau, but his appeal had to be decided by the same medical body.	The Act of 1925 gives the miner three months' time within which to appeal from the decision of the Medical Bureau, but his appeal has to be decided by an independent Medical Board of Appeal. The period within which he has to appeal is the same period within which he has to cease work underground.
The Act of 1919 debarred a miner who got worse from receiving further benefits if he did not apply for benefits or cease work within three months, and he so debarred his dependents from ever receiving any benefits.	The Act of 1925 also debars a miner who gets worse from receiving further benefits if he fails to apply for benefits or cease work within three months, but if the miner so debarred is in the secondary stage or complicated stage, or if he dies from silicosis or if silicosis contributes to his death, his dependents become entitled to a monthly pension.
The Act of 1919 did not allow a miner to leave his lump-sum compensation on loan with the Board, but the Board arranged to do this in the past with the consent of the Government.	The Act of 1925 gives a miner the right to leave the whole or part of his lump-sum compensation with the Board at compound interest. The Board will act as his bankers, and he will be able to draw the whole or any part of his money at any time, and in the event of his death any balance plus interest will be paid to his dependents or to his estate.
The Act of 1919 provided compensation in a lump sum to a miner who was suffering from pure tuberculosis (ordinary consumption) if he were certified to be so suffering within a year of his last employment on a scheduled mine. He became entitled to an award equal to that of the primary stage.	The Act of 1925 contains the same provision and provides the same period, namely, a year. *Miners who have not received compensation and who have left the mines should see that they are thoroughly examined within a year from the date they were last employed.* A miner who is certified to be suffering from pure tuberculosis within a year of his last employment underground will be entitled to the primary stage award.
The Act of 1919 provided benefits to widows and only three children under sixteen years of age, and also to persons who were wholly dependent upon a deceased miner, provided their deceased breadwinner was in the secondary stage, complicated stage, or died from silicosis.	The Act of 1925 provides benefits to widows and all children under sixteen years, all physically and mentally defective children, persons who are wholly dependent, and persons who are partly dependent upon a deceased miner.
The Act of 1919 provided a monthly pension to the *prior* law beneficiary miner who was in the secondary or complicated stage and also to the *present* law beneficiary miner in the same stages.	The Act of 1925 also provides monthly pensions to both these classes.

The Act of 1919 provided a monthly allowance to the *prior* law pensioner's dependents, but only if the miner died from silicosis or if silicosis contributed to his death, but the *present* law pensioner's dependents could get the monthly allowance automatically after his death.

The Act of 1919 provided that the oversea dependents of a *prior* law pensioner were debarred from receiving benefits after his death if the pensioner received in allowances less than £750 before he died.

The Act of 1919 provided that the oversea dependents of a *present* law pensioner shall receive the balance up to £750 after his death if the pensioner received in allowances less than £750 before he died.

The 1919 Act provided a monthly pension to the widow of a *prior* law beneficiary miner if such miner died from silicosis or if silicosis contributed to his death, and a monthly pension to the widow of a *present* law beneficiary miner if such miner died from silicosis which was in the secondary stage.

The Acts of 1916, 1917, and 1918 debarred a miner who received benefits under the Acts of 1911, 1912, and 1914 from receiving further benefits if he was not resident in South Africa on and after the 1st August, 1916.

The 1919 Act condoned such absence if the miner returned before the 1st of June, 1919, or before the 10th of January, 1921, if the delay in his return was due to circumstances arising out of the Great War.

The Act of 1919 made no provision for *prior* law beneficiary miners who had only received £96, £196, £200, or £300, who had not progressed, and who were suffering from silicosis in the ante-primary or primary stage or from pure tuberculosis. There are approximately 2,420 such cases to be levelled up in South Africa and oversea.

The Act of 1919 made no provision for *prior* law beneficiary miners who had received £400 or £275 or less, and who were oversea and suffering from silicosis in the secondary stage or from silicosis with tuberculosis.

The Acts of 1916, 1917, and 1918 provided £750 as the amount in compensation to be paid to miners suffering from silicosis in the secondary stage or in the complicated stage. Some of these sufferers were not debarred from receiving the sum £750 by going oversea, but others could not be granted the full amount of £750 because they were not resident in South Africa. This invidious differentiation created great discontent and dissatisfaction.

Under the Act of 1919 the dependents of the deceased *prior* law beneficiary miner had to apply for benefits within twelve months from the 1st August, 1919, and had to be resident in South Africa. Some widows applied after the twelve months had expired and were debarred from receiving benefits.

The Act of 1919 excluded from benefits a dozen widows of miners who died many years ago. These widows received no benefits under the Acts of 1916, 1917, and 1918 because they were not under those Acts considered to be in necessitous circumstances.

The Act of 1919 gave the widows of deceased *prior* law beneficiary miners the choice between a monthly life pension and a monthly instalment out of the unpaid balance of a *prior* law lump-sum award. A certain number of widows preferred the instalment to the pension. The lump sums subsequently became exhausted, and these widows were then unable to get the monthly pensions.

The Act of 1919 made no provision for the South African born widows of deceased beneficiary miners who left South Africa many years ago and died oversea. These women and children went oversea with their moribund husbands and fathers, and they were therefore not resident in South Africa when these beneficiary miners died. They were therefore debarred from receiving benefits owing to their enforced absence from South Africa.

The Act of 1925 provides a monthly allowance automatically to the dependents of *prior* law as well as *present* law pensioners after their death, irrespective of the cause of death.

The Act of 1925 provides that the oversea dependents of a *prior* law pensioner shall receive the balance up to £750 after his death if the pensioner received in allowances less than £750 before he died.

The Act of 1925 contains the same provision as regards benefits to the oversea dependents of a *present* law pensioner. Oversea dependents of both classes of pensioners are now on a level footing.

The 1925 Act provides a monthly pension to the widow of a *prior* law as well as of a *present* law beneficiary miner if such miner died from silicosis or if silicosis contributed to his death. Dependents of both classes are now on a level footing.

The 1925 Act will restore the benefits under the Acts of 1916, 1917, and 1918 if the miner returned to South Africa before the 1st of July, 1924, and has been resident in South Africa since the date of such return to the date of the award.

The Act of 1925 makes provision for these *prior* law beneficiary miners by levelling up the awards of primaries and pure tuberculotics to £532. 10s. and the awards of ante-primaries to £355. Such levelling up is based on earnings at £30 per month. It is estimated that this scheme will cost approximately £500,000.

The Act of 1925 provides for the levelling up of all these awards from £375 and £400 to £750, and will restore the position to all secondary stage and complicated *prior* law beneficiary miners without any residential restrictions. There are approximately 800 such cases to be levelled up, and it is estimated that the cost involved will be in the neighbourhood of £300,000.

Where the beneficiary miner to be levelled up has died either in South Africa or oversea, the relatives of such deceased miner will be eligible to receive the benefits which the deceased miner was entitled to had he not died, but such relatives must be able to prove that they were dependent upon the deceased miner.

The Act of 1925 will give benefits to these widows who were excluded from the 1919 Act, provided that the Medical Bureau certifies that their late husbands died from silicosis or that silicosis was present in the causation of their death. There are many such widows, but the few who would be assisted have had a hard struggle in the past few years.

The Act of 1925 will include benefits to these twelve widows. It is considered inequitable to withhold benefits from a widow whose husband during his lifetime was a saving or a thrifty man.

The Act of 1925 will, under certain conditions, restore the monthly pension to these widows who subsequently found out that they had made the wrong choice under the 1919 Act. The Board was in no way to blame in this matter. The widows had the right to choose and they preferred a larger monthly instalment to a smaller monthly pension. The instalments were bound to peter out eventually, while the monthly pension was for life.

The Act of 1925 provides for this class of dependents under certain conditions, one of which is that they must have returned to South Africa within two years of the date of death of their husbands and have not since the date of their return left South Africa for any purpose whatever.

The Act of 1919 made inadequate provision for safeguarding the interests of certain beneficiary miners who went on active service or who did work of national importance oversea during the 1914–18 war, and who were prevented thereby from returning to South Africa within a prescribed period.

The Act of 1919 made no provision for working miners who went oversea as volunteers and who subsequently returned to South Africa. These miners could not get benefits from the Military Special Pensions Board, neither could they get compensation from the Miners' Phthisis Board. If such miners were disabled by any lung diseases, they were in the past placed between two stools and did not know who should assist them.

The Act of 1919 made no provision whatever for the exemption from income tax assessment of amounts paid in lump sums or monthly pensions to miners and their dependents who are beneficiaries of the Board. This was a very great hardship.

The Act of 1919 made no provision for widows and other dependents on their remarriage. The monthly pensions to widows ceased and determined on their remarriage, while the allowances to any children under sixteen years were continued until they attained the age of sixteen years.

The Act of 1919 provided compensation to miners who contracted silicosis on any *outside* mines in the Union, but such compensation had to be paid by the Government out of public revenue. This is quite wrong in principle, because compensation for an occupational disease should form a first charge upon the mine or mines responsible for the contraction of the disease.

The Act of 1919 did not make any provision for a man who contracts or has contracted silicosis and who only worked part of his time underground and part of his time on the surface at a scheduled mine, that is, the man who worked less than 100 hours per month underground.

The Act of 1925 gives the Board discretionary power to extend any prescribed period and to reconsider the claims of a certain number of persons who had already returned to South Africa. The Board will, however, not have power to consider any claims of people who are still oversea at this stage.

The Act of 1925 provides for the establishment of a Joint Medical Board consisting of two doctors from the Medical Bureau, two doctors from the Military Special Pensions Board and a chairman appointed by the Minister of Mines and Industries. (This joint body will attend and have been attending to all these working miners who were volunteers during the Great War. The chairman of this Joint Medical Board is Dr. John van Niekerk.)

Provision was about to be made in the Act of 1925 for all compensation to be exempted from income tax assessment, but the clause was withdrawn in Select Committee because the necessary provision had more suitably been made by the Government in the Income Tax Amendment Act.

The Act of 1925 provides that a widow or other dependent (except a child under sixteen years) who is in receipt of a monthly pension will be entitled to a lump-sum payment in one sum equal to twenty-four months' pension on remarriage, while the allowances to any children under sixteen years will be continued until such children attain the age of sixteen years.

The Act of 1925 makes special provision for miners who contract or have contracted silicosis on any *outside* mine. Where the *outside* mines on which such miners contracted silicosis can afford to pay for the compensation, they will now have to do so. If they cannot afford it and have made no profits, compensation will be paid by the Government. A special fund will be established for this purpose.

The Act of 1925 makes provision for compensating a man who contracts or has contracted silicosis and who has worked less than 100 hours per month underground. This is right in principle because a man may not be a whole-time underground miner and yet contract the disease.

CHAPTER VI.

PRICES AND VARIATIONS IN THE COST OF LIVING.

§ 1. Introductory.

1. **General.**—No adequate measures were taken until January, 1919, to ascertain with regularity as a section of routine statistics the facts relating to prices and the comparative cost of living in various parts of the Union. The only material previously available was that reported upon (1) in January, 1914, by the Economic Commission which referred particularly to the lack of means and authority for collecting the necessary data on a sufficiently comprehensive scale; (2) in 1916 by a Special Commission to inquire into increased costs attributable to the War; and (3) by the Cost of Living Commission appointed in 1917 to inquire further into the rise of prices. Summaries of the reports of the Commissions have been given in previous issues of this *Year Book*; but are not repeated in full, a short reference only being made thereto, as they have been replaced by figures collected from January, 1919, under authority of the *Statistics Act.* These figures include wholesale and retail prices, the former from 1910 and the latter from 1895. Under the same statutory authority a yearly census of rents of habitations was taken to 1923 (from 1918 to 1920 this census was taken at half-yearly intervals). The cost of living at various periods from 1895, as denoted in the various tables given in this Chapter, has been calculated upon data rendered available as the result of the various investigations referred to.

2. **Statistics of Prices and Cost of Living.**—The Economic Commission of 1913 definitely advised the Government to charge itself with the establishment of a section of statistical work covering the principal subjects with which the Commission had been dealing, i.e. prices, rents, the cost of living, and wages, as having a vital interest for the workers and industrialists of the Union, and a direct bearing upon the economic problems which then faced the country, and during succeeding years have faced it more insistently. This Commission and the subsequent Commissions referred to above, which were appointed in 1916 and 1917, found themselves at a disadvantage owing to the absence of statistical data; and comparisons with other Dominions showed that in this particular respect the Union was most unfortunately placed. It was not, however, possible to give effect to the recommendations of the Economic Commission until the latter part of the year 1918, when a section of the Office of Census and Statistics was constituted for the purpose of maintaining a regular service of statistics of this character.

During the period which has since elapsed much has been done to collate such scattered information as was already in existence, mainly consisting of data obtained by various commissions and in particular by the Cost of Living Commission. From January, 1919, the Office of Census and Statistics took over from the last-named Commission the work of preparing and publishing monthly statements as to price movements; and in addition to this work has done everything possible to make good some, at least, of the deficiencies of the past in this branch of statistics, and to initiate a regular and reasonably adequate statistical service.

It was fortunate, however, that the experience of other countries was available; and the Statistical Council in its consideration of a scheme to cover this important subject had before it the experience of Australia (where a highly specialized system has been created by the Commonwealth Statistician), New Zealand, Canada, and the United States of America. In all these countries the matter had received detailed consideration; and statistical methods had been afforded close and critical examination. Thus the system adopted in South Africa, though modified to suit the peculiar circumstances of a country

in which the bulk of the population consists of native and coloured persons, has been very largely borrowed from systems practised elsewhere.

The system has been fully explained in a publication (S.P. 13) issued in August, 1919, which was followed by similar reports issued in subsequent years. The last of this series was issued in 1922 (S.P. 35).

3. **What is an Index Number?**—Queries have frequently been addressed to officers of the Statistical Department on the meaning of index numbers and the method of their construction. A good deal of ignorance seems to prevail on this subject among that portion of the general public not versed in economic literature, and the following note, therefore, tries to give the main points in simple and popular language:—

Index numbers can be used for comparing the changes over a period of time of a great variety of complex facts. For purposes of illustration, we shall use one of the commonest sets of facts in regard to which index numbers are used, viz., Prices.

The level of wages is fixed from time to time by the parties interested, on the basis of the level of prices as then existing. It is consequently a matter of some importance to know the extent to which the level of prices changes from time to time, as large changes of this nature are bound to have an influence on wage agreements. The price level is compounded of a great variety of different prices, and the problem which the index number has been invented to solve may be briefly put thus: How is one to place, say, one ton of coal and one ounce of pepper on a common basis?

This is done by representing the price of each (and of all other commodities) by a figure like 100 or 1000. The change in the price at another time is then represented by a proportional change in the 100 or 1000, the index number. Ultimately an average is taken of the index numbers of the commodities included, thus establishing a "level of prices" for them all.

In view of the fact, however, that it does not necessarily take the same time to consume one ounce of pepper as one ton of coal, steps are taken in most index numbers to-day to increase the importance of some articles by multiplying the figures relating to them by numbers representing roughly their greater importance, and the resulting index number is called a "*weighted*" index number.

The figure for the period taken as starting point to measure the change (represented usually by 1000) is termed the "base."

§ 2. Wholesale Prices.

1. **System of Collection.**—The list of commodities in regard to which prices are collected under the *Statistics Act* comprises 188 articles. A Report on the subject (S.P. 13) contains an explanation of the method of collection. The list of commodities may be extended from time to time should this prove expedient; and prices have been traced back to 1910.

2. **Price Indexes and Prices.**—In calculating price indexes for individual commodities the prices in the year 1910 have been taken for the present as the basis for comparison (1000).

The different groups of wholesale indexes for 1910–1921 have been weighted on the average national consumption basis of three years—1917–1919. For the years 1922, 1923, 1924, and 1925 the consumption basis for the purpose of weighting has been advanced to the average of 1918–1920, 1919–1921, 1920–1922, and 1921–1923 respectively In future, the weighting will be done on the basis of the national consumption for the years 1922 to 1924. Information for arriving at the national consumption has been drawn mainly from the import and export figures and the agricultural and factory censuses.

Price averages are based on quarterly returns furnished by representative firms in Cape Town, Port Elizabeth, East London, and Durban, as representing the coast centres and in Johannesburg as representing the inland centres. The following method of calculating the average price for the Union has been adopted:—

> As regards each town separately, the predominant price or, if there is no predominant price, the actual price nearest to the average of all quotations, is taken as the base price; the arithmetical average of the base prices for the coast towns is then calculated; finally the Union price is obtained by taking the mean between the Johannesburg base price and the average of the base prices for the coast towns.

The indexes for the years since 1919 have been constructed by averaging the indexes for January, April, July, and October in each year.

The following tables give the indexes of groups for a series of years :—

WHOLESALE PRICES—INDEXES OF GROUPS, 1910 TO 1925.

(*Basis—Index Number for* 1910 = 1000 *in the case of each Group.*)

(i) SUMMARY OF GROUP INDEXES.

Year.	All Groups.	Food and Groceries.	Food, Groceries, Fuel, and Light.	Other Groups..	South African Goods.	Imported Goods.
1910.....	**1000**	**1000**	**1000**	**1000**	**1000**	**1000**
1911.....	979	968	970	1009	967	1010

IX. Fuel and Light....	990	1510	1658	1743	1454	1247	1244	1232
X. Soft Goods*.....	1362	3255	4418	3324	2361	2285	2196	2160
XI. Miscellaneous.....	1275	2475	3174	2899	2029	1732	1720	1688
ALL GROUPS.....	1204	1854	2512	1805	1445	1424	1448	1424

* As consumption of articles included in Group X cannot be estimated, indexes for this group hav been arrived at by taking the arithmetical average of the indexes for individual commodities.

§ 3. Retail Prices.

1. **System of Collection.**—Monthly quotations are obtained from fifty-seven towns, including six towns in South-West Africa. Retail dealers, fully representative of their locality and of good standing, have been selected in each town, and are required to render quotations each month in respect of articles dealt with by them during that period. The practice followed is to require that the return shall quote the retail, over-the-counter, selling price of each article named therein, or of that brand or grade of such article most commonly in demand. The price, in other words, is the actual price predominating in the bulk of the month's sales of each article specified.

The arithmetical average of the quotations in respect of each town in the case of the principal towns, and otherwise of each area (see following paragraph), is used in constructing the index number. (For method applied prior to 1926, see previous issues of this Year Book.)

2. **Price Indexes.**—Price indexes are given for the nine principal towns of the Union regarded as a whole in table (i) (*a*) representing relative prices of commodities in various groups. These figures are used as a basis of the graph included in this section. Similar information for 1919 and later years is given in tables (i) (*b*) and (*c*) for the seven regions into which the Union has been mapped for the purpose. Indexes are given in table (ii) showing the relative cost of food in the nine principal town from 1910. Particulars are given in table (iii) of average prices from 1895 of retail commodities in the nine principal towns of the Union regarded as a whole, and, from 1919 onwards, in the seven regions referred to. These prices have been used for the calculation of the indexes in table (i). The price for each town has been weighted according to the white population in order to secure the average for all towns. The towns enumerated in each region are as follows :—

REGIONAL DIVISIONS OF THE UNION FOR THE PURPOSE OF STATISTICS RELATING TO RETAIL PRICES AND THE COST OF LIVING.

Division.	Towns and Areas from which Price Quotations are Received.
I. Coastal.....	Cape Peninsula, Port Elizabeth, East London, Durban, Mossel Bay, Uitenhage.
II. South (Non-Coastal).	Paarl, Oudtshoorn, Grahamstown, Queenstown, Cradock, Umtata.
III. Central.....	Kimberley, Beaufort West, Bloemfontein, Kroonstad, Jagersfontein, Aliwal North.
IV. Eastern.....	Pietermaritzburg, Harrismith, Ladysmith, Newcastle, Standerton, Kokstad.
V. Witwatersrand and Pretoria	Johannesburg, Pretoria, Krugersdorp, Germiston, Benoni.
VI. Northern (excluding V)	Ermelo, Pietersburg, Rustenburg, Middelburg, Potchefstroom, Witbank, Vryburg, Mafeking.
VII. North-Western.....	Calvinia, Prieska, Upington.

(i) INDEXES OF RETAIL PRICES OF FOOD, FUEL, AND LIGHT.

§ 4. Housing and Rents.

1. **Rent Legislation.**—A *Rents Act* was passed by Parliament in 1920, with effect from June of that year until the 30th June, 1921, and was re-enacted annually until 1924, when it was made permanent by Act No. 29. A summary of the original Act, which provided for the constitution of rent boards with power to order the reduction of rents, was given in the sixth and previous issues of this *Year Book*.

2. **Housing Loans Funds.**—The total amount voted by Parliament for the establishment of Housing Loans Funds in the different Provinces under the *Housing Act* of 1920 (see previous issues of this *Year Book*) was £2,381,000 (to the 31st March, 1925), and on this basis the Central Housing Board, from the date of its inception to the 31st December, 1924, approved a number of municipal housing schemes and housing loan applications involving a total commitment of £1,821,228. Particulars are given in the appended tables which show (i) the position as regards house construction and loans authorized under the Act in each of the Provinces, and (ii) the extent to which advantage was taken of the facilities provided by the Act in certain urban centres. It is to be noted that financial stringency led, in 1921, to the considerable curtailment and subsequently to the suspension of the programme contemplated under the Act.

4. **Censuses of Rents.**—The first inquiry of this kind held by the Census and Statistics Office under the Statistics Act, 1914, was undertaken during the month of August, 1918, in the nine largest centres of the Union. Altogether, some 20,000 returns as to rented houses were obtained in these areas, distributed between agents and owners on the one hand and occupiers on the other, the latter obtained by a house-to-house canvass by specially appointed enumerators.

Care was taken to secure uniformity of system in collecting information in each town, and attention was specially directed to typical houses in the main residential localities. To this end the houses in each area (i.e. the bulk of the houses with the exclusion of the highest and poorest types) were graded into three general classes, representing (i) houses of better type in ordinary residential localities, (ii) houses of average type in medium residential localities, and (iii) houses in poorer localities or of poorer type. Houses were classed according to the number of rooms, and rents of houses of less than three rooms or more than six rooms were excluded.

It was decided that censuses of rents should be taken every six months, and a second census was taken in respect of March, 1919, returns on this occasion being asked for only from agents and owners of rented houses. This method was employed in all the nine principal towns up to and including March, 1921.

So far as the larger towns were concerned, there was found but little to criticize as regards the method of collecting details of rents from owners and agents above referred to, the houses dealt with by house agents being sufficiently numerous to provide a reasonably true average of all houses. In the case of the smaller towns, however, where comparatively small numbers of houses were dealt with by agents, this system was not so successful. Again, in the case of towns of lesser importance to which the system of collection of rent data through owners and agents could not be applied, other sources of information had to be resorted to with not very satisfactory results. It was, therefore, found necessary to institute, save in the largest towns, Cape Town and Johannesburg (Witwatersrand), a census of rented houses through the medium of the post, and the same system was adopted in the case of all smaller towns. The first complete census through the post was held in March, 1922.

It may also be mentioned that in the case of some of the smaller towns the method of direct enumeration was employed in connexion with the last annual census.

Seeing that there was every indication that rents, generally speaking, were becoming more stabilized, it was considered advisable to substitute for the half-yearly investigations taken up to March, 1921, an annual rent census on a more complete scale. The last annual census was held in March, 1925.

As previously indicated, investigation was also made as to rentals of habitations in various other towns in the seven regions of the Union, utilized for statistics of the cost of living, and particulars as to the predominant rentals in the nine principal towns and seven regional divisions are given hereunder. The figures represent the results of censuses of rents of habitations occupied by Europeans.

(i) INDEXES OF RENTS OF HOUSES OF THREE TO SIX ROOMS IN (*a*) NINE PRINCIPAL TOWNS AND (*b*) SEVEN REGIONAL DIVISIONS, 1910 TO 1925.

The upward tendency of rents was to some extent maintained to March, 1922, but relatively the increase was still below the rise in food prices on the 1910 basis, although the latter fell by 35 per cent. since October, 1920. Building costs continued to be high, and as new houses were built, their rents tended to be higher than those of existing dwellings.

The figures resulting from the March, 1925, rent census show only a very slight average increase as compared with those for the previous year, less than 1 per cent. This is due to the inclusion of rented houses built since May, 1923. This feature was particularly noticeable in East London, where a large proportion of the new houses were built in the best neighbourhoods. In Pretoria, if new houses had not been included, there would have been a slight fall instead of a slight rise in the average rent. The fall in the case of Bloemfontein is probably due to the increase in owner-occupation, which was especially marked in the case of new houses. In the case of a number of the smaller towns included in the calculations for seven regional divisions, where the postal rent census was not thought to be satisfactory, the method of direct enumeration was adopted.

5. **Rent Returns at Population Censuses.**—At the 1921 Population Census, as at the 1918 Census, data were gathered as to ownership (private or otherwise) of dwellings, numbers of dwellings, and occupants and rents of private dwellings (3 to 6 rooms). The inquiry was limited to the urban areas of the Union. In the rural districts the housing question does not present a problem of great difficulty, particularly in a country possessing the favourable climatic conditions prevailing in South Africa.

A summary of the results derived from this investigation was given in the sixth issue of this *Year Book*. A full analysis of the data is contained in the Report on the Population Census of 1921, issued by the Census Office in 1924.

§ 5. Cost of Living.

1. **General.**—Statistics as to variations in the cost of living were published monthly by the Cost of Living Commission from December, 1917, to December, 1918; after which date the monthly statements were superseded by statistics of prices compiled by the Census and Statistics Office. Full information regarding the methods of compilation is given in annual reports dealing with wholesale and retail prices, rents, and the cost of living, and also in previous editions of this *Year Book*.

It is necessary to emphasize the point that while the figures published purport and do in fact measure with a reasonable degree of accuracy *variations* in the cost of living according to the European standard, they do not indicate either a minimum or maximum standard. Their value is relative and they provide means for comparing the average cost of living at different times and furnish other data which can be applied to questions affecting the cost of living; but they do not, as often they are wrongly supposed to do, give a direct index of the cost of living of any particular class.

By the latter part of 1920 sufficient information had been collected to enable calculations to be made on the basis of national consumption instead of the somewhat arbitrary family budget utilized previously.

The national consumption figures are prepared, as far as possible, on a three years' average (see § 2, par. 2 above) and represent the consumption of food by Europeans and by coloured persons who have adopted a European dietary. The bulk of the maize, kaffir corn, and rice has been excluded, and the consumption of milk has been estimated by recalculating the budget figure in proportion to the European population, with due allowance for the increased use of fresh milk and decreased use of condensed milk. The weight for rent has been obtained by taking the number of European occupants per house in the urban areas and assuming that the same proportion is true for the whole country.

Indexes in the case of the years 1895 to 1909 have been calculated on the budget system. Satisfactory information as to prices was obtainable up to the year 1909 for six towns only. The weighted average of these six towns has been calculated on the proportion of these towns to the nine towns in 1910=1000. On the assumption that the cost of living in Pretoria, Johannesburg, and Bloemfontein in 1895–1909 was in the same proportion to the six towns as in 1910, these figures should give a fair estimate of the average for the Union. Indexes from 1910 have been calculated on the national consumption basis. Table (i) (*b*) gives the same relatives as are contained in Table (i) (*a*) in a somewhat more popular form, showing the changing value of the sovereign calculated as being worth 20s. in 1910. Table (ii) gives figures corresponding to those contained in Table (i) (*a*) and (*b*) in respect of seven regional divisions of the Union for the years 1919 to 1925.

More complete figures for the years preceding 1910 will be found in earlier issues of this *Year Book*.

2. **Comparison of Retail Prices in certain Countries.**—The following table gives index numbers of the average retail price of certain commodities in 1914 and December, 1924, for the United Kingdom, Canada, Australia, and New Zealand, with South Africa as the base (1000). It is of interest to note that in the case of food-stuffs before the war the United Kingdom was roughly one-third cheaper than South Africa, but that now the average prices are approximately equal. It is more difficult to obtain comparable figures for rents. The following figures have been utilized :—

South Africa.—The weighted average rent of houses of three, four, five, and six rooms in the nine principal towns

United Kingdom.—Report of the Working Classes Cost of Living Commission (Cd. 8980). Rents paid by skilled artizans and percentage increase shown in the *Ministry of Labour Gezette.*

Canada.—Weighted average rent of six-roomed houses chiefly occupied by workmen in sixty cities.

Australia.—Unweighted average of the rents of four, five, and six rooms in Sydney and Melbourne.

New Zealand.—Unweighted average of the rents of four, five, and six rooms in four principal towns.

PRICE INDEXES—AVERAGE RETAIL PRICES OF CERTAIN COMMODITIES IN THE UNITED KINGDOM AND THE DOMINIONS.

(South Africa in each case=1000.)

3. **Price Fluctuations in the United Kingdom and the Union.**—The following table gives the wholesale and retail price indexes for the United Kingdom and the Union. It will be seen that there is a general correspondence between the fluctuations of wholesale prices of imported goods in the Union and wholesale prices in the United Kingdom.

PRICE INDEXES IN THE UNITED KINGDOM AND THE UNION.

(Base 1914=1000 in each case.)

(*a*) WHOLESALE PRICES.

* Figures for July each year.

4. **Purchasing Power of a Sovereign in the United Kingdom and the Dominions.**—The following table has been framed for the purpose of indicating the relative purchasing power of money at various periods in Australia, Canada, New Zealand, the United Kingdom, and South Africa. For this purpose the prices applicable to each period and country have been weighted according to the family budget system. The resulting relatives furnish comparisons based in each case upon the average prices in nine principal towns in the Union in 1910:—

PURCHASING POWER OF A SOVEREIGN COMPARED IN SOUTH AFRICA, AUSTRALIA, CANADA, NEW ZEALAND, AND THE UNITED KINGDOM, 1910, JULY, 1914, AND 1924. (BASIS OF TABLES—UNION OF SOUTH AFRICA, 1910 = £1.)

United Kingdom	—	0 11 7	1 0 1	—	0 15 7	1 8 3

5. **Prices of Wheat, Flour, and Bread in Different Countries.**—The following tables give the wholesale prices of wheat and flour, as well as the retail prices of bread in England, the Dominions, and the United States for a number of years. The prices in all countries were subject to a certain amount of control during the war period. The prices for the United States and Canada are converted at exchange parity. It will be noticed that prices in South Africa are, and consistently have been, considerably in excess of those obtaining even in a largely importing country such as England.

6. **"Sundries."**—The question of the inclusion of "sundries" (that is, clothing, soft goods, boots, vegetables, and wood, sundry groceries, coloured and native servants, and hardware) as an item in the determination of the cost of living is one that presents considerable difficulties. Reference should be made to the sixth issue of this *Year Book*, where the question is more fully dealt with.

While it has been considered that, for the purpose of wage calculations, the use of figures calculated on the basis of food, fuel, light, and rent is much safer, it became evident that in many cases the "sundries" figures were being used in conjunction therewith for wage agreements and calculations. It was therefore decided in order to meet the demand for percentage figures on these lines, regularly to publish a table containing the combined indexes for food, fuel, light, rent, and sundries from 1910 onwards. It has been assumed in constructing this table that the prices for "sundries" followed the same course as items of food, fuel, light, and rent from 1910 to 1914. Since then in constructing the price-indexes for food, fuel, light, rent, and sundries, the former has been combined with "sundries" in the proportion of two to one, on the assumption that the amount allowed for expenditure on "sundries" forms approximately one-third of the total household expenditure.

The following table contains the resulting indexes:—

PRICE INDEXES (RETAIL—FOOD, FUEL, LIGHT, RENT, AND SUNDRIES) IN NINE TOWNS, 1910 TO 1925.

(Weighted Average of Nine Towns in 1910=1000.)

Period.	Cape Town.	Port Elizabeth.	East London.	Kimberley.	Pietermaritzburg.	Durban.	Pretoria.	Witwatersrand.	Bloemfontein.	Weighted Average.

7. **Profiteering Act, 1920.**—Particulars of the *Profiteering Act*, 1920, which expired on the 30th June, 1922, were given in previous issues of this *Year Book* (Nos. 4 and 5).

CHAPTER VII.

PUBLIC HEALTH AND HOSPITALS.

§ 1. Public Health.

1. **Public Health—History and Development.**—An interesting and valuable article contributed by Dr. J. Alexander Mitchell, Secretary for Public Health and Chief Health Officer of the Union, on the history and development of the Health Administration of the country before and after the constitution of Union, with special reference to the prevalence of certain diseases amongst both European and non-European sections of the population, appeared in earlier issues of the *Official Year Book*, but has had to be omitted owing to demands of space. The reader is referred to *Year Books* Nos. 3, 4, 5, 6, or 7 for information on the subject.

2. **Plague.**—This disease was unknown in South Africa prior to 1899, when a small outbreak from infection introduced from India occurred at Delagoa Bay, with an extension to Middelburg, Transvaal. During the Anglo-Boer war infection was introduced with forage and other articles imported for military purposes from plague-infected ports in South America and India. Between 1900 and 1905 there were 1,694 cases of plague reported from different parts of the country now forming the Union, resulting in 947 deaths. A detailed summary of these outbreaks is published in *Official Year Books* Nos. 3 to 7. Between 1905 and 1912 no cases of plague were reported. Since 1912 sporadic outbreaks have occurred, and in 1924–25 considerable alarm was created by the discovery that there was widespread and virulent infection amongst veld rodents in certain parts of the country, and a consequent increase in the cases of plague amongst human beings.

The following table shows the incidence of plague from the date of Union, 1910, up to and including the health year ended the 30th June, 1925 :—

SUMMARY OF PLAGUE OUTBREAKS IN THE UNION SINCE THE 30th MAY, 1910, SHOWING THE NUMBER OF CASES AND NUMBER OF DEATHS AMONGST EUROPEANS AND NON-EUROPEANS.

* A plague epizootic occurred amongst rodents at the Docks and in three or four other localities.
† No infection in rodents or other animals discovered.
‡ Existence of enzootic plague in veld rodent established. This is believed to have been the cause of the recurring outbreaks in these districts since 1916.

* Infection in veld rodents.
† Widespread and virulent infection in veld rodents.

3. **Typhus Fever.**—Epidemic outbreaks of what was described as "low-fever," accompanied frequently by high mortality, have occurred at periodic intervals in the Cape Province. The similarity of the disease to that of typhus fever has since been recognized and the more recent epidemics identified as such. Investigations have further established the fact that the disease is spread mainly, if not entirely, by lice, and its eradication is, therefore, a simple matter if only a reasonable standard of personal and domestic cleanliness and deverminizing be persisted in. The scattered native communities in and about the Transkei, where the disease is frequently found, and the resentment and suspicion aroused in the native mind by what appears to them European interference, makes the problem of eradication a more difficult matter than it otherwise need be.

The following table gives the number of cases of typhus fever reported amongst Europeans and non-Europeans over a series of years, together with the number of deaths from the disease :—

TYPHUS FEVER IN THE UNION—NUMBER OF CASES AND DEATHS REPORTED—1917 TO HEALTH YEAR ENDED JUNE, 1925.

Year.	European.		Non-European.		Total: All Races.	
	Cases.	Deaths.	Cases.	Deaths.	Cases.	Deaths.
1917	31	5	3,935	832	3,966	837
1918	9	3	2,699	492	2,708	495
1919	25	4	4,803	1,118	4,828	1,122
1920	81	12	11,195	1,779	11,276	1,791
1921	132	17	9,025	1,123	9,157	1,140
1922	60	11	8,471	1,020	8,531	1,031
1923	59	4	2,864	433	2,923	437
1st January to 30th June, 1924	27	1	805	119	832	120
1924–25	37	—	1,107	163	1,144	163

4. **Public Health and Sanitation, etc.**—Considerably increased attention has in recent years been paid to matters of public health and sanitation in South Africa, especially in the larger urban centres. All of these, practically all the smaller towns, and a good many villages, now have gravitation water supplies—purification works being provided where the supply is taken from streams or rivers liable to pollution.

The majority of the larger centres and some of the smaller towns have water-carried sewerage systems, public slaughterhouses, isolation hospitals, and other essential requirements of up-to-date towns.

Infant and maternity welfare and town planning have, in the past, been neglected, but during the last few years a greatly increased amount of interest has been taken in these and kindred matters.

5. **Habit-forming Drugs.**—Apart from the provisions applicable to all poisons under the Medical, Dental, and Pharmacy laws, special Ordinances were passed in the Transvaal in 1905 and 1906, imposing restrictions on the importation and sale of opium. Regulations on the same subject in respect of the other Provinces were subsequently made under powers conferred by certain Customs laws.

The Union, as a signatory to the Versailles Peace Treaty (Article 295), became a party to the International Opium Convention of 1912, and undertook to enact legislation bringing into force the provisions of the Treaty in respect not only of opium, but also of cocaine, Indian hemp (dagga), and other habit-forming drugs. Pending the passing of a consolidating Medical, Dental, and Pharmacy Bill for the Union (in which it is proposed to deal comprehensively with the whole matter of habit-forming drugs), wide powers to make regulations on the subject were conferred on the Governor-General by section 10 of the *Customs and Excise Amendment Act*, No. 35 of 1922. Regulations under that section, promulgated by Proclamation No. 181 of 1922, prohibit the importation of any habit-forming drug except under special permit issuable only to medical practitioners, dentists, pharmacists, or veterinarians, and also prohibit the sale, supply, or use of any such drug except for purely medicinal or scientific purposes. The Regulations promulgated under Proclamation No. 181 of 1922 were amended by Proclamation No. 38 of 1924 so as to provide for the purchase of tincture of opium (laudanum) by farmers and owners of live stock for the prevention or treatment of diseases in stock, also for the procuring and keeping of cocaine solutions for "first-aid" treatment of eye injuries or other necessary purposes by managers of factories or workshops.

6. **Notifiable Infectious Diseases.**—The table given below shows the diseases which are notifiable by medical practitioners in the Union and the notifications of each disease during a series of years.

NOTIFICATIONS OF CASES OF INFECTIOUS DISEASES BY MEDICAL PRACTITIONERS 1921 TO 30th JUNE, 1925.

E = European. O = Other.

Diseases.	1921.	1922.	1923.	1st Jan. to 30th June, 1924.	1st July, 1924, to 30th June, 1925.

* Including Transkei.

7. **Local Health Authorities.**—For certain purposes, such as the control of sanitation, outbreaks of infectious disease, and other measures undertaken in the interests of the health of any urban community, most municipalities and some other local authorities in the Union have health officers and health departments attached to the local authority responsible for the area concerned. Owing to the absence of uniform legislation the scope of these departments varies considerably and cannot here be taken in review.

8. **District Surgeons.**—For the carrying out of the health and medical work devolving on the Government in the various districts of the Union medical officers known as district surgeons are employed, a few in large centres devoting the whole of their time to the work, but the large majority undertaking the Government work concurrently with their private practice. At the end of June, 1925, there were, in all, 279 district surgeons, of whom 8 were whole-time officers, 4 were whole-time but employed jointly with local authorities or public bodies, and 267 were part-time.

9. **Port Health Work.**—A port health officer is appointed by the Union Department of Public Health at each port of the Union to carry through the usual inspection and control for public health purposes of vessels arriving at and leaving the Union. Such officers act with the immigration officers in an advisory capacity in determining the physical fitness of immigrants into the Union. Entry is debarred, except under approved conditions, in the cases of such persons as are suffering from mental or physical defects, or are afflicted with disease. Tuberculosis is a disease specially cited as a disqualification in the case of an immigrant, and special authority is necessary for a person suffering from the disease to enter the Union. [See Section 4 (1) (*g*) and (*h*) of Act No. 22 of 1913.]

10. **Inspection and Prevention of Adulteration of Food and Drugs.**—Matters relating to diseased or unsound food are dealt with by local authorities under the *Public Health Act* and various municipal ordinances and the by-laws and regulations made thereunder. Adulteration of food and drugs is dealt with by the Government Health Department in the Cape, Natal, and the Orange Free State under special enactments; in the Transvaal it is dealt with by the municipalities under regulations made under a local ordinance; and in Natal the municipal authorities have certain powers under the municipal laws. At the ports the adulteration laws are enforced by the Health Department acting in co-operation with the Department of Customs and Excise.

The present laws relating to adulteration and the prevention of false description of food and drugs are unsatisfactory and inadequate in material respects. A consolidating and amending *Food, Drugs, and Disinfectants Bill* has been prepared for but has not yet been passed by Parliament.

11. **International Health Organization and South African Health Intelligence System.**—The Union is a party to the International Health Convention of Rome signed in 1912, and is represented on the committee of that organization by one of the health officers of the Ministry of Health who has had extensive experience of public health work in South Africa. That Office has recently been linked up with the health organization established at Geneva under the League of Nations. Periodical reports and bulletins on matters of international health concern are furnished to the Health Department by these two organizations. Health cablegrams are exchanged fortnightly between the Health Department and the British Ministry of Health, and there is a reciprocal arrangement between the Union and Australia, New Zealand, and India, under which health information of urgent importance is cabled as occasion requires. By arrangement with the Imperial Government, British Consuls in foreign countries cable the Union Government, at its cost, information regarding outbreaks of formidable epidemic disease or other matters likely to be of use to South Africa.

In February, 1925, a Conference representing Governments and Sanitary Organizations in the Far East was held at Singapore, under the auspices of the League of Nations, and arrangements were made for opening an Epidemic Intelligence Bureau at Singapore. These arrangements have since been completed with the aid of a grant of $25,000 (approximately £5,000) from the Rockefeller Foundation towards the expenses of the Bureau for the next five years. The Bureau will receive weekly telegraphic reports regarding epidemic diseases from all countries in the "Eastern Area," including the East Coast of Africa and the Union of South Africa, and will transmit—by telegraph or wireless—from Saigon, a weekly summary in code to all countries concerned. This system will be of great value in connexion with the Port Health Administration of the Union.

Weekly bulletins, stating the incidence of formidable epidemic disease and particulars as to any undue prevalence of other infectious disease in the Union, together with the latest available data as to the occurrence or prevalence of formidable epidemic diseases in other countries, are published by the Health Department and widely distributed. Weekly abstracts of returns of notifications of infectious diseases throughout the Union are also distributed by the Department to the Medical Officers of Health of the major municipalities in the Union and others specially concerned.

Monthly returns of outbreaks and cases of, and deaths from, formidable epidemic diseases are also published by the Health Department.

§ 2. General Hospitals.

1. **Cape of Good Hope Hospitals.**—Under Ordinance No. 5 of 1912 all Divisional Council areas in which there is a state-aided hospital, dispensary, or convalescent home, are constituted hospital districts. In every hospital district there is a hospital board, and these boards have control and management of every state-aided hospital, dispensary, or convalescent home within the area for which the board is constituted. The boards are financed by Provincial subsidies calculated on the amount of their revenue derived from patients' fees and voluntary contributions and bequests. Boards may establish, with the approval of the Administrator of the Province, any of the following kinds of institutions: (*a*) hospitals for the reception or relief of persons requiring medical treatment; (*b*) dispensaries; (*c*) maternity homes; (*d*) convalescent homes; (*e*) sanatoriums; (*f*) institutions established for any other purpose which the Administrator by proclamation in the *Gazette* declares to be a public charitable purpose within the provisions of the Ordinance; (*g*) institutions established for any two or more of the above-mentioned purposes.

Committees of management may be established from among the members of a board for the administration of any matters within the power of the board. A board may make regulations in respect of any institutions under its control on certain matters provided for in the Ordinance.

The following table summarizes such statistics as are available in regard to general hospitals which are under the control or supervision of the Cape Provincial Administration :—

GENERAL HOSPITALS—CAPE OF GOOD HOPE, 1914 TO 1924.

Year.	Daily Average Number of Patients.	Ordinary Revenue.	Ordinary Expenditure.	Daily Average Cost per Patient.	Grants-in-Aid.*
		£	£	s. d.	£
1914	34·41	166,627	127,804	9 1·31	69,557
1915	33·99	162,480	135,882	9 3·77	70,509
1916	31·78	193,476	156,265	9 4·65	43,072
1917	35·11	134,995	155,560	8 5·65	69,993
1918	36·81	174,459	187,629	9 1·98	61,893
1919	38·84	181,566	204,628	10 3·16	90,045
1920	40·10	227,665	266,567	11 1·63	151,042
1921	37·57	306,735	329,324	11 8·25	184,978
1922	36·1	119,858	230,681	12 2·00	107,677
1923	34·66	123,007	231,601	11 4·95	106,878
1924	32·06	125,535	230,868	10 6·6	101,599

* For period ending 31st March of following year. The figures from 1922 onwards are worked out on an amended and more satisfactory basis, to show actual ordinary revenue and expenditure and grants-in-aid.

2. **Natal Hospitals.**—There are seven hospitals in Natal, directly controlled by the Provincial Administration, viz., Addington Hospital, Durban, Grey's Hospital, Pietermaritzburg, and Cottage Hospitals at Newcastle, Dundee, Eshowe, Port Shepstone, and Vryheid.

In addition to the above, there are other institutions which receive financial assistance from Provincial funds but are controlled by other than Government authority. These are as follows: Ladysmith, Estcourt, and Pietermaritzburg Sanatoriums; native hospitals at Dundee, Ridge Road, Durban, and Kwamagwaza; Indian Hospitals at Amatikulu, Felixton, and Estcourt; and hospitals at Empangeni and Lansdowne Mission Station at Somkele.

Grey's Hospital was established under Law No. 4 of 1877, but has now been taken over by the Provincial Administration under Ordinance No. 9, 1922.

The medical control of the hospital is exercised by a resident medical superintendent appointed by the board, but there is also a visiting medical staff, entirely honorary, consisting of four surgeons, two physicians, and one ophthalmic physician.

Addington Hospital, Durban, is entirely under the control of a permanent medical staff appointed by the Provincial Administration. There is a board of management representative of various interests and elected annually, but this board has no executive functions and acts only in an advisory capacity. This institution was opened in 1879, the number of patients admitted in that year having been 642. The buildings consisted of two large wards and an administration block. Subsequently another storey was added, and from time to time additions have been erected including an operating theatre, laundry, nurses' home, new kitchen, Indian quarters, isolation ward, mortuary, and separate buildings for the treatment of native and Indian patients. The present staff consists of a resident medical superintendent and 5 assistants, a nursing staff of 120 and a clerical and house staff of 150, including Indians.

The five cottage hospitals at Dundee, Newcastle, Eshowe, Vryheid, and Port Shepstone serve the interior districts and are maintained solely at Government expense. A local practitioner is in medical charge at each place, and a matron assisted by an adequate nursing staff is in residence.

The sanatoriums at Pietermaritzburg, Estcourt, and Ladysmith are controlled by the Roman Catholic mission and receive substantial grants-in-aid from Government, provided that they have qualified hospital nurses on their staffs.

The following table summarizes such statistics as are available in regard to general hospitals which are under the control or supervision of the Natal Provincial Administration :—

GENERAL HOSPITALS—NATAL, 1913–14 TO 1923–24.

Year.	Revenue. (Government Hospitals.)	Expenditure.	Grants-in-Aid.
	£	£	£
1913–14	6,314	21,588	10,740
1914–15	7,476	21,604	11,560
1915–16	7,756	23,957	11,850
1916–17	9,571	26,138	12,580
1917–18	16,890	32,708	13,450
1918–19	14,426	38,871	14,500
1919–20	16,175	48,763	19,476
1920–21	20,484	65,088	32,658
1921–22	31,269	62,329	31,201
1922–23	25,564	73,626	13,290
1923–24	25,958	86,055	2,917*

* The decrease in the total amount of grants-in-aid for 1923–24 is due to the fact that Grey's Hospital, Pietermaritzburg, became a Government institution in 1922.

3. **Transvaal Hospitals.**—The following hospitals are maintained by the Provincial Administration, and committees are appointed under the provisions of the *Hospital Committees Ordinance*, 1917, for their management :—

Johannesburg.	Germiston;
Boksburg.	Barberton.
Krugersdorp.	Klerksdorp;
Pretoria.	Pietersburg.

The Chronic Sick Home at Rietfontein, near Johannesburg, is managed directly by the Provincial Administration.

The following hospitals are supported by grants-in-aid : Bochem ; Jane Furse Memorial Hospital ; Elim ; Queen Victoria Maternity Hospital, Pretoria ; South African Hospital, Pretoria ; Hope Convalescent Home for Children, Johannesburg ; and cottage hospitals at Ermelo, Heidelberg, Middelburg, Potchefstroom, Roodepoort-Maraisburg, Sabie, Schweizer Reneke, Duivelskloof, M'phahlele Location, and Standerton.

The following table summarizes such statistics as are available in regard to general hospitals which are under the control or supervision of the Transvaal Provincial Administration :—

GENERAL HOSPITALS—TRANSVAAL, 1917–18 TO 1923–24.

Year.	Revenue. (Fees.)	Expenditure.	Grants-in-Aid.	Government Hospitals.				
				Average Daily Population.		Percentage.		Ordinary Maintenance Cost per Diem.
				European.	Non-European.	European.	Non-European.	
	£	£	£					s. d.
1917–18	61,787	193,244	9,382	954·83		—	—	12 1·71
1918–19	64,486	231,572	9,720	763·33	254·52	75·00	25·00	12 2·26
1919–20	67,079	267,205	4,397	759·57	278·00	73·20	26·80	12 10·02
1920–21	73,537	333,773	9,266	785·43	292·06	72·89	27·11	15 4·75
1921–22	69,149	340,273	11,794	768·50	305·90	71·53	28·47	15 6·13
1922–23	63,995	294,240	9,351	795·80	301·84	72·51	27·49	13 5·02
1923–24	66,624	301,493	10,199	893·99	325·68	73·30	26·70	12 6·03

NOTE.—It is not possible to obtain comparable figures prior to 1917–18, owing to the different system of hospital administration in force before that date.

4. **Orange Free State Hospitals.**—The administration of general hospitals which are public in character is provided for by the *Hospitals and Charitable Institutions Ordinance*, 1913, in terms whereof these institutions are subsidized by the Administration on the £ for £ basis. The management of such hospitals, as well as the full financial responsibility in respect of them, is vested in boards which consist of six or twelve members according to determination by the Administrator in consultation with the old members, if any. One-third of the members are appointed by the Town Council or Councils, one-third by the Administrator, and the remaining one-third are elected by registered contributors. In the event of a deficit occurring in any year and the Administrator being satisfied that the board has done all in its power to guard against such an occurrence, the deficit is paid in whole or in part by the Administration, and the Town Council or Councils concerned, in equal proportions. In terms of an amending Ordinance, No. 4 of 1922, the Administrator may, however, exempt a Town Council or Town Councils from payment of the whole or any portion of the amount payable by them in respect of such deficit. All movable and immovable property is vested in the board, which may also borrow money, whether by way of bank overdraft or in any other manner, for the purpose of erecting buildings or making additions or alterations to buildings or of purchasing land, and on every loan raised for any of such purposes one-half of the interest and sinking fund charges on such loan forms a direct charge on the revenues of the Provincial Administration. In terms of section 51 of the principal Ordinance, as amended, a hospital may be closed with the consent of the Administrator and, on the dissolution of the Board as a result thereof, all movable and immovable property which vested in terms of the Ordinance in the Board so dissolved shall become vested in the Administrator to be held in trust by him. A board may further, with the approval of the Administrator, borrow money by way of bank overdraft for the purpose of meeting any ordinary recurrent expenditure. The board, besides controlling and managing the hospital for the district defined in terms of the Ordinance, also has the control and management in accordance with the Ordinance of every other hospital or kindred charitable institution in the district.

The admission of patients applying to the board for treatment, as well as the terms on which treatment will be afforded, whether free, at reduced rates, or at full rates, is governed by section 53 of the Ordinance, and in terms of section 54 (2) indigent patients may be admitted at the instance of the Administrator for free treatment.

Section 62 provides for the framing of regulations not inconsistent with the Ordinance—

(1) regulating the admission or discharge of patients and the amounts of the fees to be paid by them;
(2) prescribing the duties of officers, nurses, attendants, and servants, and the conditions upon which registered medical practitioners not on the staff may attend patients at the institution;
(3) maintaining order and discipline; and
(4) generally making provision for all matters affecting the management, care, control, and superintendence of the institution and the fulfilment of the purposes thereof.

The accounts of the board are audited from time to time by auditors appointed by the Administrator, and for general administrative purposes hospitals are inspected from time to time by the medical inspector of hospitals appointed under the Ordinance, who is required to furnish the Administrator annually with a report upon the administration of the Ordinance, such report being laid before the Provincial Council.

The following table shows the expenditure of the Orange Free State Provincial Administration on hospitals and kindred institutions from the year 1913–14 onwards:—

EXPENDITURE OF ORANGE FREE STATE PROVINCIAL ADMINISTRATION ON HOSPITALS, 1913–14 TO 1923–24.

Year.	Amount.	Year.	Amount.	Year.	Amount.
	£		£		£
1913–14.....	10,662	1917–18.....	9,075	1921–22.....	19,815
1914–15.....	11,317	1918–19.....	12,748	1922–23.....	14,639
1915–16.....	6,583	1919–20.....	12,834	1923–24.....	16,079
1916–17.....	7,928	1920–21.....	22,670		

§ 3. Mentally Disordered or Defective Persons.

1. **Legislation.**—Act No. 38 of 1916 repeals all previous Acts in force in the Provinces of the Union on this subject. The Act covers all cases of mental disorder or defect where, as a result of such disorder or defect, the patient is incapable of managing himself or his affairs, is a danger to himself or others, or requires care, treatment, and control. The provisions of the Act apply to and the procedure is the same for persons of all ages.

Detention of patients, whether in public institutions, single care, licensed institutions, general hospitals, or elsewhere is, with certain exceptions specially provided for, legal only when authorized by a magistrate, court, or a judge. The Act authorizes the appointment of a Commissioner of mentally disordered or defective persons, styled Commissioner for Mental Hygiene, and of boards to visit and report on the institutions and the welfare of the patients. The care and administration of the property of mentally disordered or defective persons is placed in the hands of the Master of the Supreme Court. Other provisions of the Act cover mentally disordered or defective persons under detention in respect of criminal offences, the admission of patients from other states or territories of Africa, voluntary boarders, patients residing in private dwellings, the establishment of licensed institutions, reception of patients in general hospitals and similar institutions, offences and penalties, use of mechanical restraint, recovery of cost of maintenance, and other matters relative to the care and control of mentally disordered persons.

2. **Mental Hospitals.**—There are eight mental hospitals and two institutions for feeble minded in the Union, the names and other particulars of which are given below :—

MENTAL HOSPITALS—CLASS OF ACCOMMODATION, 1925.

Name of Institution.	Province.	Races Treated.
Valkenberg Mental Hospital	Cape of Good Hope	All races.
Grahamstown Mental Hospital	Cape of Good Hope	All races.
Port Alfred Mental Hospital	Cape of Good Hope	Coloured races only.
Fort Beaufort Mental Hospital	Cape of Good Hope	Coloured races only.
Queenstown Mental Hospital	Cape of Good Hope	All races.
Pietermaritzburg Mental Hospital	Natal	All races.
Pretoria Mental Hospital	Transvaal	All races.
Bloemfontein Mental Hospital	Orange Free State	All races.
The Alexandra Institution for Feeble-minded	Cape of Good Hope	Europeans only.
The Witrand Institution for Feeble-minded	Transvaal	Europeans only.

3. **Institutions for Feeble-minded Persons.**—The Alexandra Institution for the Feeble-minded, near Cape Town, was acquired by the Union Government in 1920 from the Cape Provincial Administration. It has been converted into an institution for European defectives of all ages. There is at this institution a school for defective children, where they are trained to be useful with their hands, and are given such instruction in ordinary school teaching as they are able to assimilate, such teaching being particularly directed to making them more efficient in the simpler or more skilled crafts and trades, according to their natural ability. From the school the children are later drafted into the special handicrafts and vocational training sections, where they are taught to be as useful and self-supporting as possible. The higher grade defectives generally become almost or entirely self-supporting under such treatment, and even the lower grade mentally deficient children become partially so. This is an advantage to the State, and they themselves are more happy and contented than they could otherwise have been. The institution was the first of its kind in this country.

A similar institution—the *Witrand Institution for Feeble Minded*—has been opened at Potchefstroom in the Transvaal.

4. **Single Patients.**—Under section 7 of the Act, a patient may be received and detained as a single patient in the dwelling of a householder who is considered to be a fit and proper person to have charge of the patient. The regulations prescribe that the medical practitioner in attendance on a single patient shall furnish periodical reports on the mental and bodily condition of the patient, and on the suitability of the arrangements for his care and treatment.

5. **Licensed Institutions.**—Chapter VI of the Act provides for the granting of licences to persons to keep houses for the reception of more than one mentally disordered or defective patient. There are twelve institutions of this description, one providing accommodation for non-European patients, the remainder for Europeans. Six are privately owned, and receive no financial support from the Government; six receive assistance. The number of registered patients in licensed houses on the 31st December, 1924, was 74 (70 Europeans and 4 non-Europeans).

6. **Mentally Defective Children in Schools.**—The question of imbecile or abnormally backward children in schools has for some time been under the consideration of the various authorities concerned, and in the Transvaal regulations have been issued which provide for the examination of backward children by a psychiatrist or a school medical officer, in co-operation with the Commissioner for Mental Hygiene. Such children, if diagnosed *very*

backward, border area, or *moron,* are to be placed in special classes or schools, and if reported *imbecile* or *moral imbecile,* they are to be debarred from further school attendance and cared for at home or in an institution under the *Mental Disorders Act.*

7. **Patients and Staff (Mental Hospitals and Institutions).**—Particulars are given in the subjoined table (i) as to staff, patients, expenditure, and receipts at mental hospitals and institutions in the Union for six years, and (ii) the average cost per patient.

§ 5. Lepers.

1. **Legislation.**—Compulsory segregation of lepers is enforced by legislation in each Province of the Union. All cases of leprosy are reported to the Government and when the nature of the disease has been fully established the patients are removed to one of the leper institutions. No uniform legislation for the Union has yet been introduced.

2. **Leper Institutions.**—The subjoined tables give particulars as to the various leper institutions in the Union, and as to the number of patients in segregation :—

(i) LEPER HOSPITALS IN THE UNION—CLASS OF ACCOMMODATION, TOTAL STAFF, NUMBER OF PATIENTS, AND EXPENDITURE, 1924.

§ 6. Registration of Medical Practitioners, Dentists, Nurses, and Chemists and Druggists.

1. **Legislation.**—The law in the Provinces of the Union affecting the registration of medical practitioners, dentists, nurses, and chemists has not yet been rendered uniform, and registration in each Province is effected under the laws in force prior to the constitution of the Union. A Medical Council exists in each Province concerned with the work of registering medical practitioners, dentists, midwives, and nurses under the regulations in force; and Pharmacy Councils control the registration of chemists.

2. **Number of Registrations.**—The following tables show the number of medical practitioners, dentists, chemists and druggists, nurses, midwives, and nurses of the insane registered in the Union and in each Province during the years indicated. It should be noted that, as the same person may be registered in more than one Province, the figures given for the Union include some persons enumerated more than once.

MEDICAL PRACTITIONERS, DENTISTS, NURSES, MIDWIVES, ETC., REGISTERED IN THE UNION, 1912 TO 30th JUNE, 1925.

CHAPTER VIII.

SOCIAL CONDITION.

§ 1. Ecclesiastical.

1. **General.**—The numbers of the population of the Union who returned themselves at the Census of 1921 as belonging to certain Churches and professing certain forms of religious belief are summarized in § 2 (16) of Chapter XXIV. The Churches referred to hereunder are those in respect of which the largest numbers of persons were returned as adherents, and represent 90 per cent. of the European population of the Union. According to the Census, the numbers of Europeans and non-Europeans claiming to belong to the Churches named hereunder and the proportions per cent. of the numbers to the population, were as follows :—

NUMBER OF ADHERENTS OF PRINCIPAL CHURCHES, CENSUS 1921.

CHURCH.	European Adherents.	Proportion per cent. of European Population.	Non-European Adherents.	Proportion per cent. of non-European Population.	All Adherents.	Proportion per cent. of Total Population.

* No Census figures are available to show the distribution of the population between the three independent divisions of the Dutch Churches, the statistics in the later paragraphs of this section being those collected by the different churches.

2. **The Dutch Reformed Church (Nederduits Gereformeerde Kerk).**—The passing by the Union Parliament of Act No. 23 of 1911 gave authority for the union of the branches of the " Nederduits Gereformeerde Kerk " in the various Provinces, and made comprehensive provision in regard to organization, the holding of property, and other matters concerning the united Church and its component congregations.

Organization.—

(*a*) Each of the four Churches (Cape, Natal, Transvaal, and Orange Free State) is ruled by a Synod, possessed of the highest legislative, judicial, and administrative power.

(*b*) To ensure regular working of Church administration, the congregations are mutually divided into Church Districts (or Circles), as fixed from time to time by the Synod.

(*c*) Each congregation has a representative and managing Church Council.

(*d*) There is also a Federal Council, which, guided by certain provisions, interests itself for the general good of the four aforesaid Churches.

(*e*) Arrangements also exist for the connection of Mission Churches with the Dutch Reformed Church.

Theological Training.—Candidates for the Ministry of the Church are trained in the Theological Seminary at Stellenbosch by Professors A. Moorrees, Dr. J. du Plessis, Dr. B. B. Keet, and Dr. Van Rooyen.

Publications.—Almanak van de Nederduits Gereformeerde Kerk in Zuid-Afrika (annual); De Kerkbode (weekly).

Statistics.—The following statistics have been furnished for the year 1923–24 :—

DUTCH REFORMED CHURCH STATISTICS, 1923–24.

	Cape of Good Hope.	Natal.	Transvaal.	Orange Free State.	Total.
	No.	No.	No.	No.	No.
European—					
Congregations	188	10	86	65	349
Adherents	345,579	10,366	162,409	133,823	652,177
Members	164,851	5,312	75,118	65,684	310,965
Mission Churches—					
Congregations	71*	6	43	53*	173
Adherents	80,74i	†	44,641‡	35,167‡	160,549
Members	22,777	1,539	13,548‡	11,698‡	49,562

* These figures do not include eleven stations in the Cape Province and ten in the Orange Free State where mission work is done by the Dutch Reformed Church, but where the congregations have not yet joined the Mission Church, that is, placed themselves under the jurisdiction or laws governing the Mission Church. The work there is carried on under the supervision of the local Kerkeraad of the European congregation.

† No statistics available.

‡ Figures for 1922–23 ; none later available.

3. **THE REFORMED CHURCH OF SOUTH AFRICA (DIE GEREFORMEERDE KERK).**—The Reformed Church of South Africa is governed according to the church regulations laid down by the Dordrecht Church Assembly of 1618–19, as far as they can be applied in the various countries, with due regard to the individual requirements of the communities. By the Synod of Steynsburg in 1913, it was decided to review and modify the church regulations of Dordrecht on the basis of the revision adopted by the Reformed Churches in the Netherlands at the Synod of Utrecht in 1905.

According to these church regulations, which do not represent an absolute law for every church or community, the functions of government rest mainly in the hands of every individual "Kerkeraad" or church council for every local congregation. Hitherto it had been the custom for the congregations of every Province of the Union to assemble once annually in General Assembly. This is still the case in the Orange Free State and Cape Province, but a change has been made with regard to the Transvaal. More in agreement with the church regulations referred to above, the Transvaal is divided into four circuits, namely Rustenburg, Pretoria, Potchefstroom, and Middelburg. Representatives of those circuits assemble once or twice in every year to deal with matters which are too difficult for the church council to dispose of. Once a year every circuit sends two representatives to the Provincial Synod, and once in three years the representatives of all church councils assemble for the General Synod. The next Synod will be held at Reddersburg, Orange Free State, in March, 1927. The Reformed Church has no Moderator or permanent Executive.

Every circuit, General Assembly, Provincial Synod, or General Synod at the commencement of its deliberations elects an Executive consisting of four members. At the close of the proceedings the Executive is dissolved.

Every congregation has its correspondent, and every Province has its corresponding church council : for the Transvaal, Potchefstroom ; for the Orange Free State, Bloemfontein ; and for the Cape Province, Burghersdorp.

The training of Ministers takes place at the Theological School at Potchefstroom. Early in 1926 there were three theological professors, viz., Dr. J. D. du Toit, J. A. du Plessis, B.A., and Dr. C. J. H. de Wet.

The *Almanac* for 1926 contains the following church statistics :—

Province.	Congregations.	Confirmed Members.	Baptized Members.	Total.
1. Transvaal	33	11,700	13,160	24,860
2. Orange Free State	20	4,039	4,172	8,211
3. Cape Province	25	4,662	3,593	8,255
4. Natal	4	160	142	302
5. Kenya Colony	1	77	74	151
6. Portuguese West Africa	2	616	812	1,428
TOTAL	85	21,254	21,953	43,207

Mission communities are to be found at Humpata, in Portuguese West Africa; Venterstad, in the Cape Province; and in the Transvaal at Uniondale, Molietsieskop (Zoutpansberg), and Middelbult (Pretoria). The Cape Province looks after the first two and the Transvaal and the Orange Free State after the others.

Twice a month the Church issues *Die Kerkblad*, consisting of twelve pages. The editing is supervised by Dr. J. D. du Toit, Prof. J. A. du Plessis, and the Rev. T. Hamersma. The administration rests with Dr. C. W. M. du Toit, Bloemfontein.

Once a year an *Almanac* is published, edited by Revs. W. J. de Klerk and J. V. Coetzee, Frankfort.

4. **Die Nederduits Hervormde Kerk.**—At the establishment of the South African Republic, Die Nederduits Hervormde Kerk was the only church of the country, and the first Constitution of 1858 provided in section 20 that this church should be the Church of the State. Its first minister, the first in the Transvaal, was the Rev. D. van der Hoff, who arrived in 1853 direct from Holland. In 1885 the church lost a large number of its members through amalgamation with the Dutch Reformed Church (Nederduits Gereformeerde Kerk) founded in 1866.

The baptized members of the church number at the present time about 37,500, and the church has 41 congregations in the Transvaal, 3 in the Orange Free State, 1 in Natal, 1 in Rhodesia, 1 in Tanganyika, 1 in Kenya, 1 in Bechuanaland, and 1 in Portuguese West Africa. The church is served by 21 ministers. Its future ministers are trained at the Transvaal University College in Pretoria, by Professors J. H. J. A. Greyvenstein, Dr. S. P. Engelbrecht, E. Macmillan, M.A., and Dr. B. Gemser. The church publications are represented by a monthly paper, *De Hervormer*, and a Church Almanac which appears annually. The church has also an orphanage at Krugersdorp.

Die Hervormde Kerk is governed according to Presbyterian Church regulations by a General Church Assembly, which meets at least once every three years, and in the intervening periods by a Commission of the General Church Assembly; and further by the three Circuits, into which the Province is divided, and by the individual church councils concerned.

The history of the church is recorded up to 1890 by Prof. Dr. S. P. Engelbrecht in "De Geschiedenis van de Ned. Hervormde Kerk," two volumes, 1920 and 1925.

5. **English Church.**—(i) *Organization and Government.*—The official title of the English Church in South Africa is the Church of the Province of South Africa (otherwise known as the Church of England), and it is in communion with the Church of England and the other Provinces of the Anglican Communion throughout the world. It is a voluntary association, and has its own constitution and its own rules and regulations. It is governed by a Provincial Synod, in which every Diocese in the Province has its representatives, both clergy and laity, and no resolution, rule, canon, or constitution is regarded as a law of the Church of the Province but such as shall have received the concurrent assent of all orders of the Church—bishops, priests, and laymen. The Church of the Province is divided into twelve Dioceses constituted in the following years: Cape Town, 1847; Grahamstown, 1853; Natal, 1853; St. Helena, 1853; Bloemfontein, 1863; Zululand, 1870; St. Johns, 1873; Pretoria, 1878; South Rhodesia, 1891; Lebombo, 1893; George, 1911; Kimberley and Kuruman, 1912; Johannesburg, 1922. A new Missionary Diocese was constituted in 1924 under the title of Damaraland and the tribes towards the North. Each of the above Dioceses has the right to send clerical and lay representatives to the Provincial Synod on the basis of one of each order for every ten (or part of ten) licensed priests in the Diocese. The enactments of the Provincial Synod are binding upon all members of the Church in South Africa, though it is expressly stated in Article II of the Constitution that the Provincial Synod of the Church of the Province shall be subordinate to a higher authority of a General Synod of the Church of the Anglican Communion, to which such Province shall be invited to send representatives whenever such General Synod shall be convened. The Church of the Province has accepted the General Consistory of the Lambeth Conference as its Court of Final Appeal. The organization of the various Dioceses is very similar to that of the Province. All the Dioceses have their Synods, but the Diocesan Synods only exercise powers delegated from the Provincial Synod, and all acts and resolutions passed by the Diocesan Synods are subject to revision by the Provincial Synod. There are at the present time some 600 clergy working in the Province, of whom the majority are employed in parochial or missionary work, but some few are engaged in educational and extra-parochial work. There being very little in the way of endowment, the work of the Churches depends almost entirely upon the free-will offerings of its members.

(ii) *Colleges and Schools.*—In connexion with the Church there are several schools and colleges for European boys and girls. Of these the principal are, for boys, the Diocesan College, Rondebosch, Cape Town; S. George's Cathedral Grammar School, Cape Town; S. Andrew's College, Grahamstown; Michaelhouse, Balgowan, Natal; S. John's College, Johannesburg; S. Andrew's College, Bloemfontein; and for girls, S. Cyprian's, Cape Town;

Herschel, Claremont (Cape); the Diocesan School for Girls, Grahamstown; the Diocesan School for Girls, Pretoria; S. Margaret's, S. Aidan's, Yeoville, and S. Mary's, Belgravia, Johannesburg; S. Anne's, Hilton Road, Pietermaritzburg; S. Margaret's Diocesan Girls' School, Umtata; S. Michael's School for Girls, Bloemfontein; several schools under the charge of the Society of S. John the Divine, Natal; S. Winifred's School for Girls at George; and a school at Lourenco Marques.

In addition to these, there are the training college for teachers, and several schools under the direction of the Community of the Resurrection at Grahamstown. There are various training colleges for native clergy and teachers, the chief of which are at Zonnebloem, Cape Town; S. Matthew's Training College, Keiskama Hoek; S. Alban's College, Estcourt, Natal; S. Bede's, Umtata; Diocesan Training College, Pietersburg, Transvaal; the College of the Resurrection, Johannesburg; and at S. Augustine's, Kwa Magwaza, Zululand. There is also at Grahamstown a training college for European clergy at S. Paul's hostel, and a newly established one for coloured clergy at S. Austin's, Cape Town.

The Church of the Province is also doing much in the education of the native and coloured people, and there are hundreds of mission schools throughout the Union of South Africa. There is a strong organization of the Church Lads' Brigade among the coloured in the Cape district; and lately a hostel has been founded at Fort Hare, the Government establishment for the higher education of natives. For sailors, it provides homes and chaplains of the Seamen's Institute at Cape Town, Port Elizabeth, Lourenco Marques, and Durban. Work has been carried on for many years among the lepers of Robben Island, and more recently, S. Raphael's Home, Faure, Stellenbosch, has been established for discharged lepers.

(iii) *Hostels and Houses of Mercy.*—Of the works of mercy connected with the Church there are three Houses of Mercy—at Leliebloem, Cape Town; Irene, Transvaal; and at S. Monica's, Queenstown. There are also the Marion Institute and a Home for friendless girls at Cape Town, and S. Monica's Maternity Home.

There are several orphanages and homes for children. Of these the principal are: S. Michael's Home, Cape Town; S. George's Orphanage, Cape Town (for girls); House of Bethany, Plumstead, Cape Town (for girls); the Woodville Orphanage, Grahamstown; S. John's Hostel, a hostel for boys attending school in Cape Town, and S. Francis (coloured), Cape Town (for boys); S. George's Orphanage, Cleveland, Transvaal (for boys).

(iv) *Sources of Revenue.*—In South Africa itself the Church raises about £174,000 yearly. Of this a sum of close on £23,000 is received from endowments, but by far the greater part is derived from church collections and subscriptions. In addition to this, an amount of about £30,000 is sent from overseas, but this is employed almost entirely on missionary work among the native peoples.

Full particulars in connection with the Church, such as the names of the Bishops and clergy, are given in the *S.A. Church Directory*, 1921, published at the English Church House, 61 Burg Street, Cape Town.

6. **Wesleyan Methodist Church of South Africa.**—Wesleyan missions were first founded at the Cape of Good Hope in 1816, by the Wesleyan Methodist Missionary Society, London, and since then have been established throughout the whole of South Africa up to, and beyond, the Zambezi River. The advent of the British settlers in 1820 made it necessary to provide religious services for the scattered European population, and this led in due course to the formation of European churches throughout the area of settlement. These churches and missions remained under the control of, and continued to be supported by, the parent society in London until 1883, when a separate South African Conference was established, and all the missions and churches south of the Vaal River were placed under its jurisdiction, under the title of the *Wesleyan Methodist Church of South Africa.* The work in the areas north of the Vaal River still continues under the control of the Missionary Society in London (see below).

(i) *Organization.*—The area under the jurisdiction of the South African Conference is divided into six districts. These again are divided into smaller areas as circuits, each under the oversight of a superintendent minister, or missionary. The administration of each district rests with an annual synod composed of representatives, ministerial and lay, of all the circuits within the district. The supreme legislative and executive authority is vested in the Annual Conference, which is composed of representatives elected by the various district synods and other official members appointed by the Conference itself.

(ii) *General Statistics.*—At the Conference held at Port Elizabeth in April, 1925, the following official returns were reported :—

	No.
Churches	1,660
Other preaching places	3,013
Ministers	277
Evangelists	310
Local preachers	5,198
Other unpaid agents	10,714
Sunday Schools :	
Schools	1,115
Officers and teachers	3,157
Scholars	45,352

(Income, £5,236.)

	No.
Church members	113,610
Candidates for Church membership	49,710
Junior (catechumen) members	50,281
Increase of Church members during the year	1,394
Day schools (native, coloured, and Indian) :	
Schools	1,077
Teachers	2,155
Scholars	75,196

(Income, £121,336.),

Native Training and Industrial Institutions :

	No.
Institutions	11
Teachers	110
Pupils	2,782

(Income, £44,363.)

English Secondary Schools :

	No.
Schools	5
Teachers (resident)	68
Scholars	815

(Income, £42,259.)

Sustentation and Mission Fund :

Total contributions	£17,304
Total revenue for all purposes, including Education	£312,509

Invested funds (Superannuation and other)	£199,871
Total estimated value of land and buildings at last valuation (1921)	£1,000,000

(iii) *Wesleyan Methodist Church in the Transvaal.*—The Wesleyan Methodist Church is organized north of the Vaal River as the *Transvaal and Swaziland District*, under a synod, of which the chairman and general superintendent is the Rev. J. W. Allcock. The district is under the control of the Wesleyan Church in England.

(iv) *General Statistics for Transvaal District.*—The following general statistics are furnished in respect of the year 1924 :—

Number of churches—		
European	78	
Native	445	
Coloured Colonial	9	
Total		532
Number of other places for religious services		847

Number of ministers—		
European	50	
Native	52	
Coloured	1	
Total		103
Number of adherents—		
European	31,585	
Native and coloured	80,963	
Total		112,548

Income of Church (1924) £63,468*

(v) *Institutions in the Transvaal.*—There are four institutions connected with the Wesleyan Methodist Church in the Transvaal : the Epworth Homes at Malvern, Johannesburg, Sunnyside, Pretoria, and Benoni, for European children, and a native training institution at Kilnerton, near Pretoria. At the latter institution native normal students are trained, and the number now receiving instruction is upwards of two hundred. A school of native agriculture is also established at Kilnerton. Social and religious work on a fairly large scale is vigorously prosecuted at the Central Hall, Johannesburg.

7. Presbyterian Church of South Africa.—(i) *Organization.*—The Presbyterian Church of South Africa is governed by its General Assemblies held annually, under a Moderator elected by the Assembly. The Moderator for 1924–25 was the Rev. Wm. Turnbull, M.A., Ladysmith, Natal, and for 1925–26 the Rev. T. R. Ballentine, B.A., Durban. The General Assembly is constituted of representatives of the seven Presbyteries of the Union, viz. : Cape Town, King William's Town, Natal, Orange River, Orange River Native, Port Elizabeth,† Transvaal, and the Presbytery of Rhodesia.

* Exclusive of Government grants for education, etc.
† Formerly the Presbytery of Adelaide.

The following figures give particulars in respect of two years.

PRESBYTERIAN CHURCH—STATISTICS FOR UNION.

Description.	1923.	1924.	Description.	1923.	1924.
	No.	No.		£	£
Congregations	*153	*153	Value of Church property †	369,777	371,782
European members	13,273	13,537	Amount raised for the Church in year	71,617	63,821
European adherents	7,175	7,596	Amount spent on native mission work	4,838	4,172
European children in Sunday schools	8,938	8,417	Amount raised by natives	2,562	2,418
Native members	4,465	4,380	Invested Funds ‡	76,119	82,535
Catechumens	1,158	884			
Mission schools	26	26			
Pupils in mission schools	1,061	1,026			

NOTE.—On the formation of the Bantu Presbyterian Assembly in 1923, the Presbyteries of Kaffraria and Mankazana became detached from the Presbyterian Church of South Africa. Hence the great reduction in the figures recording the membership and finance of the Church's native mission work. The figures given now indicate exactly what is being done by the Presbyterian Church of South Africa from its own resources and without any subsidy from oversea for the evangelizing of South African natives.

* Congregations, including mission charges, 93; preaching stations, 60.
† Including orphanage.
‡ Including capital of Widows' Fund, Aged Ministers' Fund, etc.

The Church has erected, at a cost of £15,000, and maintains, at Queenstown (Cape Province), an orphanage for the accommodation of ninety children.

In July, 1923, the Bantu Presbyterian Church was formed.

(ii) *Historical Sketch.*—The first Presbyterian Church in South Africa was organized in Cape Town in 1813 by the Rev. George Thom, and included in its congregation a considerable number of units from the 93rd Regiment stationed at the Cape, as well as civilians. The regiment, however, left the following year, and in 1818 Mr. Thom became minister of the Dutch Church at Caledon. In 1820 the congregation called the Rev. Dr. Philip to the pastorate, but to meet his views a congregational platform was adopted and the church thereafter ceased to be Presbyterian. In 1827, under the Rev. Dr. Adamson, the Church of St. Andrew's, Cape Town, the oldest Presbyterian congregation in the Union, was established, and in 1838 a Mission for liberated slaves was instrumental in founding the coloured Presbyterian congregation of St. Stephens in Riebeek Square.

The Presbytery of Cape Town, formed in 1893, originally consisted of the parent church of St. Andrew's, with the congregations of the Gardens, Woodstock, and Clifton Hill churches. These had started as branches under the St. Andrew's session. This Presbytery now includes eight European congregations and a native church, and maintains a Home Mission in Cape Town.

The Presbytery of Port Elizabeth (until recently Adelaide) has as its leading congregation the Hill Church in Port Elizabeth. This church, founded in 1861, inaugurated and helped to establish churches in both the South and North Ends of the town. Other congregations of the Presbytery are Glenthorn (1840) and Tarkastad, both associated with Mission work, and on this account these churches have received financial aid for many years from Mission Committees in Scotland.

The Presbytery of King William's Town.—This Presbytery, constituted in 1898, is composed for the most part of the European congregations previously belonging to the Presbytery of Kaffraria, and consists of ten European and three Mission congregations.

Presbytery of Natal.—The pioneer of Presbyterianism in Natal was the Rev. Wm. Campbell, who, sent out by the Free Church of Scotland, was called to and settled in Pietermaritzburg in 1851. He, together with the Rev. Chas. Scott, of Pinetown, and the Rev. D. Lindley, an American missionary, formed the Presbytery of Natal in 1852. This is the oldest Presbytery of Colonial Churches in South Africa, and now consists of seventeen European congregations. It was in connexion with this Presbytery that the original congregations of the Orange River and Transvaal Presbyteries were established.

The Presbytery of the Orange River was formed in 1898, the church at Harrismith, established in 1881, being the oldest Presbyterian Church in the Orange Free State Province. The congregation at Kimberley, founded in 1878, joined the Assembly in 1902 and was then united to the Presbytery of the Orange River. This Presbytery consists of twelve European congregations and several preaching stations.

The Presbytery of the Transvaal was constituted in 1890. The first Presbyterian minister to settle in the Transvaal was the Rev. Andrew Allen, who was inducted in Johannesburg in 1887. The church at Pretoria was founded in the same year as the Presbytery was constituted, there being then four congregations. This number has since increased to seventeen, all European, and some preaching stations. A Native Mission and several native congregations are attached to the Presbytery.

The Presbytery of Rhodesia, formed in 1907, contains three European congregations, the oldest being Bulawayo, established in 1898. A Native Mission was founded in 1908.

(iii) *General Assembly.*—The formation of a General Assembly at Durban in 1897, under the Moderatorship of the Rev. John Smith, introduced a new era into the history of Presbyterianism in South Africa. The movement first took practical shape at a conference held in Kimberley in 1892, when a Federal Council was formed, which met annually between the years 1893 and 1897 and prepared a basis for Union. The newly formed church comprised the four Presbyteries of Natal, Transvaal, Cape Town, and Kaffraria (now incorporated in the Bantu Presbyterian Assembly), and the congregation of Port Elizabeth. Altogether twenty-six European and nine native congregations were included. There are now eight Presbyteries, consisting of seventy-four European and twenty-six native congregations connected with the Assembly.

8. **Roman Catholic Church.**—The Union contains the following ecclesiastical divisions of the Church :—

Delegate Apostolic—
The Most Rev. Jordan Gijlswijk, O.P., Titular Archbishop of Euchaita, Bloemfontein.
Western Vicariate, Cape Province—
Vicar-Apostolic : The Right Rev. Bernard O'Riley, D.D., St. Mary's Cathedral, Cape Town.
Eastern Vicariate, Cape Province—
Vicar-Apostolic : The Right Rev. Hugh MacSherry, D.D., St. Augustine's, Port Elizabeth.
Central Prefecture, Cape Province—
Prefect-Apostolic : The Right Rev. F. Hennemann, Church of St. Saviour's, Oudtshoorn.
Gariep Prefecture—
Prefect-Apostolic : The Right Rev. Mgr. Demont, Aliwal North, Cape Province.
Mariannhill Vicariate—
Vicar-Apostolic : The Right Rev. A. Fleischer, R.M.M., the Monastery, Mariannhill, Natal.
Natal Vicariate—
Vicar-Apostolic : The Right Rev. Henry Delalle, D.D., O.M.I., Emmanuel Cathedral, Durban.
Vicariate of Eshowe—
Vicar-Apostolic : The Right Rev. T. Spreiter, O.S.B., Inkamana, P.O. Vryheid.
Vicariate of the Transvaal—
Vicar-Apostolic : The Right Rev. David O'Leary, D.D., O.M.I., the Immaculate Conception, Johannesburg.
Prefecture-Apostolic of Northern Transvaal—
Prefect-Apostolic : The Right Rev. Mgr. S. Nuffel, Pietersburg.
Lydenburg Prefecture—
Prefect-Apostolic : The Right Rev. Mgr. D. Kanczor.
Vicariate of the Orange River—
Vicar-Apostolic : The Right Rev. John Simon, D.D.
Vicariate of Basutoland—
Vicar-Apostolic : The Right Rev. Julius Cénez, O.M.I., Roma.
Prefecture of Swaziland—
Prefect-Apostolic : The Right Rev. Mgr. M. Bellezze, O.S.M., Bremersdorp, Swaziland.
Prefecture of Windhoek—
Prefect-Apostolic : The Right Rev. J. Gotthardt, O.M.I., Windhoek.

General Statistics.—The following figures are given for the year 1925 :—

	No.		No.
Bishops*	11	Churches, chapels, and stations	260
Prefects-Apostolic	5	Convents	35
Priests	251	Communities	15
Religious Brothers	305	Colleges and schools	262
Nuns	1,774	Other institutions	7

* Two on the retired list : Bishop Rooney of Cape Town and Bishop Cox of Johannesburg.

9. **Congregational Churches.**—The Congregational, or Independent, Churches in South Africa have been closely connected during a century with the London Missionary Society, which, though unsectarian, has generally been associated intimately with Congregationalism. The chairman for 1924–25 was Mr. Wm. Anstey, P.O. Box 1003, Johannesburg, and for 1925–26 the Rev. G. Crawford Stanley, M.C., Congregational Church, Bree Street, Johannesburg; treasurer, E. K. Mackay, Esq., P.O. Box 5632, Johannesburg; secretary, R. J. Johnson, Esq., M.A., Central Congregational Church, Bree Street, Johannesburg.

General Statistics.—The following figures give information for the year 1924–25:—

Number of	ministers	77
,,	lay preachers	755
,,	buildings	412
,,	Church members	24,972
,,	children in Sunday schools	8,853
,,	teachers in Sunday schools	700

*10. **The Jewish Community.**—(i) *Congregations.*—There are about 150 congregations in the Union. Most congregations have their special places of worship. Each congregation has its official who ministers to its religious needs. Johannesburg and Cape Town have their Rabbis, who possess the rabbinical diploma, and rank as the highest authorities in religious matters; congregations of lesser size have ministers and preachers, who, although specially trained to the religious calling and qualified to carry out their religious duties, have not attained to rabbinical rank. The smallest congregations have *readers* and *shochtim* (a *shochet* is a person qualified to kill animals for human consumption in accordance with the Jewish method of slaughter), who conduct the services and teach the children.

(ii) *Educational Activities.*—There are nineteen special Hebrew schools in South Africa, seven of which are in Johannesburg. In the smaller communities, where there are no special Hebrew schools, Hebrew classes are held in the synagogues and conducted by the local minister, so that religious instruction is carried on in practically every Jewish community in South Africa.

(iii) *Charitable Institutions.*—In the field of charity the South African Jewish community has displayed considerable activity. The community looks after its own poor. There is hardly a town of any appreciable size that has not its Jewish helping hand or benevolent society. Johannesburg has sixty-eight Jewish institutions in all, and no less than thirty-eight of them are either partly or solely charitable institutions. The majority of the thirty-eight are friendly sick benefit and benevolent societies. The chief Jewish charitable institutions in South Africa are the South African Jewish Orphanage in Johannesburg, the Cape Jewish Orphanage in Cape Town, the Jewish Aged Home, the Jewish Helping Hand and Burial Society, and the Hebrew Benevolent Association in Johannesburg, and the Jewish Board of Guardians in Cape Town. Apart from the congregations, educational, charitable, and friendly societies mentioned, the other Jewish institutions in Johannesburg are Zionist, cultural, social, and intellectual. Although not so numerous as in Johannesburg, there are Jewish institutions in Cape Town devoted to similar objects, whilst towns like Pretoria, Bloemfontein, Durban, Port Elizabeth, Kimberley, Oudtshoorn, East London, and Paarl also possess Jewish cultural, social, and friendly societies.

(iv) *Jewish Board of Deputies.*—There are two institutions that are South African organizations. They have constituent societies in the various towns in South Africa and their head offices are in Johannesburg. They are the South African Jewish Board of Deputies and the South African Zionist Federation. The Jewish Board of Deputies for the Transvaal and Natal held its inaugural meeting on 28th July, 1903. The following year a similar Board for Cape Colony was formed in Cape Town. Each led a separate existence until 1912, when, at a South African Congress held in Bloemfontein, both were merged into the present South African Board. The objects of the Board of Deputies are to "watch and take action in such a manner as it may think proper with reference to all matters affecting the welfare of the Jews in the southern portion of the Continent of Africa," and "to make observation of all proceedings relative to legislative and other enactments and to use such means as it may deem requisite in order that no infraction of the rights, custom, and privileges of the Jewish community may ensue therefrom." The Board of Deputies has 112 constituent bodies throughout South Africa.

(v) *Zionist Movement.*—The Zionist Federation to-day embraces 180 affiliated Zionist societies and other Jewish bodies, situated in all parts of the sub-continent, whilst it has hundreds of representatives in smaller communities where no organized society exists. It has so far held nine conferences. It publishes an official monthly organ, *The Zionist Record*, which has a large circulation throughout the country, and is the only publication which bears an official Jewish character. The South African Zionist Federation acts in all matters

* Information supplied by the Secretary, South African Jewish Board of Deputies.

as the official South African Branch of the world Zionist organization. Its main business is to propagate the principles of the Zionist Movement amongst the Jewish population, to foster a knowledge of the Hebrew language, history, and culture, and to raise funds for the furtherance of the objects of the Zionist Movement, whilst it engages either singly or in co-operation with other organizations in various activities designed to further general Jewish welfare.

In the discovery and development of the diamond and gold fields Jews played an important part. The names of Barnato, Joel, Beit, Albu, and the late Senator S. Marks are well known in this connexion.

(vi) *Statistics.*—The following table shows the number of Jews in the various Provinces of the Union as ascertained at the Censuses of 1911 and 1921 respectively :—

JEWS IN THE UNION, CENSUSES OF 1911 AND 1921.

UNION	27,820	19,099	46,919	34,063	28,040	62,103

§ 2. Benevolent Institutions and Organizations.

1. **General.**—The Union has no lack of benevolent organizations in country districts, as well as in the towns, and seeing that there is no poor law in any of the Provinces, and that poor relief by the State has only been necessary on any considerable scale in such circumstances as existed in the period of depression which followed the South African War, and on certain other exceptional occasions, the greater part of assistance given to persons in poverty and distress is that afforded by the various benevolent institutions. It has also to be noted, however, that in all the larger towns and in many other localities public general hospitals have been established, supported in a few cases altogether, and in most cases at least in part, by the State, which also (see Chapter VII) provides and controls hospitals for the mentally diseased and hospitals and institutions for lepers. Exigencies of space make it impossible to enumerate the various benevolent organizations to be found throughout the country, but it may be noted that, apart from the benevolent institutions belonging to the various churches (see § 1 above) and the smaller organizations attached to individual churches in most localities, there are in various towns such organizations as the following :—Ladies' benevolent societies, aid associations, children's homes and orphanages, children's aid societies, Salvation Army homes, social farms, rescue homes, and other institutions maintained by the Army organization ; homes for the aged and the poor, Nazareth homes, convalescent homes, local representation of the St. Vincent de Paul Society, and Jewish and other benevolent societies.

2. **Government Expenditure on Poor Relief.**—Particulars are given in the subjoined tables as to expenditure by the Administration in each Province for a period of years on relief of paupers, the maintenance of certain institutions for the accommodation of poor persons suffering from chronic infirmities, and grants-in-aid of certain other non-Government benevolent institutions :—

* Grants to orphanages have been omitted from these figures. In 1918–19 and 1919–20 the payments to orphanages amounted to £1,850; 1920–21, 1921–22, and 1922–23, £2,500.

3. **Charitable Institutions.**—The following particulars are furnished in respect of all Government, Government-aided, and Private Institutions in the Union, the object of which is to afford relief, protection, or shelter to those persons who are in distress, in need of succour, or homeless. Such institutions include orphanages, childrens' homes, creches, homes for convalescents, aged, or infirm persons; institutions for decrepit and chronic sick persons, rescue homes, shelters for men and women, almshouses, and kindred institutions, but do not include benevolent or friendly societies, charity organizations, hospitals, maternity homes, sanatoriums, lazarettos, or infectious diseases hospitals.

4. **Benevolent Institutions in Cape Peninsula and Johannesburg.**—The first four issues of this *Year Book* contained lists of benevolent institutions in the Cape Peninsula and Johannesburg. These have not been repeated owing to considerations of space.

5. **The Governor-General's Fund.**—Previous issues of this *Year Book* (Nos. 1 to 5) contained particulars of the operations of the Governor-General's Fund inaugurated in September, 1914, with the object of relieving distress caused to persons on active service during the war or to their dependents resident in the Union. The fund continued in existence after the termination of hostilities, and the large sum collected, amounting in the aggregate to about £3,250,000, was gradually disbursed in aid of disabled soldiers and the widows and families of soldiers who had lost their lives in the war. The vocational training of ex-soldiers was largely furthered in the period after the war. Revenue from investments and contributions during 1923 amounted to £38,626, and the disbursements £76,895. At the 31st December, 1923, the balance of the fund amounted to £695,035 and at the same date in 1924, at £670,137.

6. **The Administrator's (Transvaal) Distress Fund.**—Particulars of this fund, which was established after the Witwatersrand disturbances in March, 1922, in order to relieve distress consequent thereon, will be found in the sixth issue of this *Year Book*.

7. **South African Prisoners' Aid Association.**—This Association, under the presidency of His Excellency the Governor-General and the chairmanship of the Director of Prisons, was formed in 1910 with the following objects:—

(*a*) The prevention of recidivism (or relapse into crime).
(*b*) To encourage the study of causes underlying crime and recidivism and to conduct public propaganda.
(*c*) The aftercare of discharged prisoners.
(*d*) To help the deserving dependents of prisoners.
(*e*) To take any steps necessary for the prevention of delinquency and the manufacture of criminals.
(*f*) To establish branches and appoint representatives wherever necessary.
(*g*) To carry out all measures required to give effect to any of the above objects.

(i) *Organization.*—The Association consists of members organized in branches in the principal centres of the Union, the directing control being vested in a Central Council consisting of the Chairman of the Association and two members nominated by each branch, which in turn works through its local committee. The fact that the Chairman of the Central Council is appointed by the Minister of Justice enables the Association to be kept in close touch with the Government. A grant is made quarterly by the Prisons Department to supplement funds raised locally by each branch for the purposes of its work. The allocation of the grant to the branches is made by the Central Council on the basis of the needs of the local work as reflected in the statistical and financial returns. In addition to the allocation of grants, the Central Council considers and shapes the whole policy of the Association. It initiates new work and represents the views and needs of the Association to the Government.

(ii) *Statistics.*—The following tables give statistics as to the operations of the Association :—

§ 3. Organization and Legislation in Promotion of Child Welfare.

1. **Child Welfare Organizations.**—(i) *Objects.*—The various agencies and organizations in the Union which are concerned with child welfare and of which the activities are co-ordinated in the central deliberative body known as the National Council for Child Welfare, have for their general objects :—

(*a*) The *prevention* of any form of cruelty to children, including efforts to deal with the following conditions—
Neglect; life in slums and over-crowding; destitution; sweating and over-work; disease; begging; crime; street trading; ignorance; prostitution; abandonment; unsuitable environment.

(*b*) The *protection* of children, involving such problems as pre-natal care, i.e. the best way to ensure the survival of healthy babies, by attention to the needs of the expectant mother; proper attention at the time of birth; by the provision of proper medical and nursing attendance where necessary; systematic attention during infancy through the agency of Infant Consultation bureaux, Babies' Welcomes and similar organizations; the care of children of school-going age, in school and out of it, including medical inspection of schools; after-care, i.e. the well-being of the adolescent boy and girl, and the elimination, wherever possible, of the blind-alley occupation and poor white problems; and the holding of mental clinics by specialists.

(ii) *History of Child Welfare Movement.*—Until the passing of the *Children's Protection Act* (No. 25 of 1913) the various laws in force in the Union with regard to the protection of children were found to be inadequate. The first effort of this kind of legislation was a Cape Colony law of 1879. A similar law was passed in Natal in 1896 and the Orange Free State in 1899. A *Children's Protection Act* was promulgated in Natal in 1901, and in 1907 the Cape Colony passed the *Infant Life Protection Act.* In 1909 the Transvaal passed a law, the main lines of which are embodied in Chapter II of the existing Union Act of 1913. The *Factories Act* of 1918 (paragraph 4) is concerned with an important aspect of the problem of child life protection. The Cape Provincial Ordinance of 1919, dealing with relief and charitable institutions, makes provision for the payment to registered societies and institutions dealing with children, and the *Union Public Health Act of* 1919 similarly authorizes the payment of grants to societies dealing with destitute children. An amendment to the *Children's Protection Act* was passed in 1921 and is proving most helpful in the interests of children. The *Adoption Act* (see paragraph 3) was passed in 1923, and promulgated on the 1st January, 1924. Quite a large number of applications are being made for the adoption of children (adopted in the past) to be legalized. An amendment to the *Prisons and Reformatories Act* (No. 46 of 1920), amongst other things, provides authority for the detention in certified hostels of juvenile offenders and others. In Johannesburg there is one hostel for girls and two for boys, and at Retreat, Cape Town, one for coloured boys.

The various enactments owed their origin to a general appreciation of the problems arising out of the high infantile mortality which prevailed in many parts of the Union. The Society for the Protection of Child Life founded in Cape Town in 1907 and the Children's Aid Society, founded in Johannesburg a year later, were formed principally with the object of coping with this question. Many similar societies have since sprung up in all parts of the Union, and the movement has spread to Southern Rhodesia.

The first Child Welfare Conference was held at Cape Town in March, 1917, followed by one in Johannesburg in May, 1918, a third being called in Durban in September, 1919. These conferences, attended by over 250 delegates from all over the Union, have done much to educate and inform public opinion generally and to stimulate Government, Provincial, and Municipal action. The fourth conference was held in Bloemfontein in September, 1920, and the fifth in Port Elizabeth in October, 1922. The sixth Child Welfare Conference was held at Cape Town in March, 1924, the principal subject under consideration being the question of preventive work, with special reference to mothers and infants.

(iii) *Child Welfare Societies.*—The following societies exist in the various Provinces :—

Cape (20).—The Society for the Protection of Child Life in Cape Town, East London, Stellenbosch, and Wynberg; the Child Welfare Society in Aliwal North, Beaufort West, Caledon, Graaff-Reinet, Grahamstown, Hermanus, Kimberley, King William's Town, Middelburg, Oudtshoorn, Port Elizabeth, Vryburg, Wellington, Kuruman, Queenstown, and Fort Beaufort.

Natal (5).—The Child Welfare Society in Durban, Greytown, Ladysmith, Pietermaritzburg, and Vryheid.

Orange Free State (4).—The Child Welfare Society in Bloemfontein, Heilbron, Springfontein, and Parys.

Transvaal (12).—The Children's Aid Society in Johannesburg, Bloemhof, Benoni, Boksburg, Germiston, and Krugersdorp; the Child Welfare Society in Potchefstroom, Pretoria, Springs, Brakpan, Klerksdorp, and Pietersburg.

All the above societies have as their main objects all measures necessary to prevent any form of cruelty, neglect, or ill-treatment of children. They especially aim at securing the adequate carrying out of all Acts of Parliament and Provincial Ordinances dealing with children. They seek to promote any legislation that may be considered necessary to improve the moral and physical condition of children; and to establish infant life bureaux, mothers' welcomes, homes for neglected and other children, and to provide or secure, when necessary, for infants and children, hospital accommodation which is not otherwise established.

Other organizations also concerned, though not so directly, with the welfare of children are the Board of Aid in Cape Town; the Rand Aid Association; the Juvenile Affairs Boards throughout the Union; the Children's Care and After-Care Committees, Johannesburg; the Committee for the Care of Mental Defectives in Cape Town; and societies such as the Women's Christian Temperance Union, the National Council of Women, and the various women suffrage societies, notably the National Service Fund in Johannesburg. Church organizations, such as the Salvation Army, do most valuable work in rescuing and succouring destitute children, and the various Christian and Jewish churches have their own societies for dealing with various aspects of the problem. Notable among these are the activities of the Dutch Reformed Church. In addition, orphanages and homes established by public and private enterprise have been opened, and hospitals and schools, in many cases, now have their guilds of helpers and boards of aid for keeping in touch with both mother and child.

Child Welfare Societies are entirely dependent for their working on donations and subscriptions from the public. In some cases municipal grants are given. In the Cape Province a certain number of societies are registered under a Provincial Ordinance which entitles them to a subsidy from the Provincial and Municipal Authorities. In the larger societies work is done by a paid staff, and in the smaller societies on a voluntary basis. Through the Public Health Department the payment of an annual grant of £1,000 for the Cape Town Mothercraft Training Centre, which includes a Dietetic Hospital for Infants, has been sanctioned.

(iv) *Activities of Child Welfare Organizations.*—(a) *Infant Consultation Bureaux.*—These have been started in various centres (six in Cape Town and suburbs), and in connexion therewith free dinners are provided daily for expectant and nursing mothers. Mothers and guardians are encouraged to bring the babies to the bureaux regularly to have them weighed. There is a doctor in attendance and lady health visitors. Medical advice is given and the proper kinds of food recommended. Simple remedies in the way of aperient and corrective medicines, tonics, ointments and liniments are provided, either free or for a small payment. The women are taught to cut out and sew simple garments, and are generally helped and advised. In most bureaux, milk tickets are given for varying periods, free or for payment, to ensure a supply of fresh milk delivered daily at the woman's own home. In Cape Town there is a milk fund, supported by private subscriptions of one shilling and upwards per month. The card indexing system is followed at the bureaux and a record kept of all children. These cards are filed for future reference, and kept for the Education Department for use where medical inspection of schools is in vogue. In Cape Town the bureaux are carried on at the expense of the Municipality, which provides the services of the medical superintendent and the lady health visitors, the Child Life Protection Society providing the helpers and voluntary workers. In other centres, such as East London, Grahamstown, Kimberley, and Port Elizabeth, bureaux are arranged on the same lines as in Cape Town, but no medical attendance is, so far, available. In Johannesburg a Babies' Welcome has been organized by the National Service Fund, with the help of the municipal lady health visitors.

(b) *Protected Infants.*—Under the *Children's Protection Act* any child under seven years of age, who is retained or received for the purpose of being nursed or maintained apart from its parents for a longer period than three days, is a *protected infant.* Within a municipal area, notice of such retaining or receiving must be given within forty-eight hours to the magistrate, or in outside areas within seven days to the field cornet of the ward. The magistrate notifies the police or the Child Welfare Society, where there is one, and the society sends one of its *authorized visitors,* men or women, to investigate the facts of the case. Reports are forwarded regularly to the magistrate for his information and any necessary action. In large centres like Cape Town and Johannesburg, the town and suburbs are divided into districts and apportioned to authorized visitors, all voluntary workers, who have satisfied the magistrate as to their fitness for the work. At the former centre the *protected infants* are now visited by the health visitors who have been appointed *authorized visitors* and who can pay more frequent visits than the voluntary visitors, as their regular work takes them into the districts almost daily. The homes of the children are visited at odd hours, on an average twice a month, and the general condition and environment reported on.

In addition, the larger Child Welfare Societies employ salaried inspectors to investigate cases of special difficulty and to carry out the instructions of the magistrate or the society. The Cape Town society employs four inspectors—three trained nurses and one other, and the Johannesburg society has one man. These inspectors investigate all complaints as to ill-treatment or neglect, warn the offenders, and, in the last resource, have them prosecuted under the Act. Cases of sickness which require treatment are sent to hospital or to the free dispensary for medicines, or, in the case of minor ailments, are dealt with at the bureau. Children are rescued from harmful and immoral surroundings, boarded out with approved foster-parents, or indentured to farmers and others, under supervision. Cases of backward or feeble-minded children are dealt with, and juvenile delinquents put on probation or sent to industrial schools.

(c) *Lady Health Visitors.* — Lady health visitors are municipal employees and their duty is, primarily, to teach the mothers and guardians the value of fresh air, cleanliness, and regular feeding, and to advise them on the proper care of their own bodies and those of the children. They report to the medical officer of health, who, in turn, reports to the Council.

(d) *District Nurses.*—In the *Cape Province,* district nurses, under the Cape Hospital Board, give free nursing attendance in necessitous cases. In the *Transvaal,* the district nurses, during their course of training, work among the needy poor in Johannesburg and district. At Johannesburg, a District Nurses' Association has been established, and is doing most useful work amongst the sick and poor of the city. In the country districts, all over the Union, the needs of the poorer people are supplied by the *King Edward VII. Order of Nurses.* All these nurses do valuable work in bringing cases, which would otherwise not be known, to the notice of the *Child Welfare Societies.*

(e) *Orphanages and Homes.*—There are a large number of orphanages and homes in the Union, most of them supported by private enterprise and in some cases subsidized by Government, where children of different ages and conditions are received. A list of such institutions in the Cape Peninsula and on the Witwatersrand was given in previous issues of this *Year Book.* Similar bodies in the *Cape Province* are the Woodville Orphanage at Grahamstown, the Children's Home at Kimberley; in *Natal* the Infant Home at Durban; in the *Orange Free State* St. Faith's Home and the Railway Orphanage at Bloemfontein, and a Weeshuis at Bethlehem and Ladybrand.

(f) *Industrial Schools.*—Government industrial schools under the Union Education Department have been established in the *Cape Province* at George, the Paarl, and King William's Town; in the *Transvaal* at Emmasdale (Heidelberg) and Standerton; and in the *Orange Free State* at Dewetsdorp and Tempe (Bloemfontein). Other industrial schools and certified institutions are in existence at Adelaide, Graaff-Reinet, Knysna, Kimberley, Potchefstroom, Riebeek West, Tulbagh, Uitenhage, Wellington, and Worcester.

(g) *Crèches and Day Nurseries.*—Crèches and day nurseries have been opened in populous centres, especially in the vicinity of factories, and found to be a boon to working mothers.

(h) *Children's Courts.*—What are virtually *children's courts* are in existence in Cape Town and Johannesburg, where, at specified hours in each week, one of the magistrates sits to hear cases of children under the Act. The inspector of the Child Welfare Society is present and furnishes the history of the child and its family and environment. In many cases of destitution and neglect the child is committed to the care of the society. In other cases the help of the society is requested in removing children from undesirable surroundings or having them sent to homes under escort.

(i) *Feeble-Minded.*—At Cape Town and Johannesburg the local Mental Hygiene Societies hold clinics at regular intervals, and many certified cases are sent to the Alexandra Training Institution and to Potchefstroom. There are two small homes in existence for the feeble-minded, one in the Cape of Good Hope at Retreat, and the other in the Orange Free State. Three homes (at Irene in the Transvaal and at Leliebloem and Claremont in the Cape of Good Hope) have been certified to take in feeble-minded girls. The Alexandra Institution (for feeble-minded) at Maitland, Cape Province, has accommodation for over one hundred children, and a school has been opened there under the control of the Commissioner for Mental Hygiene.

At the Third Annual Child Welfare Conference held in Durban in 1919, schemes were drawn up for the formation of four Provincial Mental Hygiene Societies and one National Council for Mental Hygiene. The latter has now been formed.

At the Fifth Conference held in Port Elizabeth in October, 1922, the following resolutions were adopted :—

" That this conference is of the opinion that additional psychiatrists are required in order to ascertain the presence of backward and mentally defective children in the schools, and to advise as to their education and treatment. That an expansion of the method adopted in Natal, viz., obtaining the services of the psychiatrist from adjacent mental hospitals, be arranged to cover other Provinces."

" That in the opinion of the National Council for the Union the authorities should be held responsible for the provision of the satisfactory education, training, and treatment of mentally backward children, and that the Ministry of the Interior be held responsible for such children as soon as they are certified defective under the Mental Disorders Act."

(j) *Medical Inspection of Schools.*—In Natal and in the Transvaal and, in a lesser degree, in the Cape of Good Hope, medical inspection of schools has been instituted. In Johannesburg there are school clinics and school nurses.

(k) *Maintenance Orders.*—Under the provisions of the Act amending the *Children's Protection Act*, maintenance orders can be secured for children, and they have proved most beneficial, especially in those cases of widowed mothers where it is desirable to keep mother and children together. In districts where Child Welfare Societies exist, these orders are paid through the Society, and the families are supervised.

(l) *Trust Support.*—Especially in the larger centres the societies act as intermediaries for the payment of military or other pensions for widows and orphaned children, and in private cases where maintenance orders have been made through the medium of the courts or otherwise.

(m) *Affiliation Orders.*—Some of the local societies have specialized in the procuring of affiliation orders and their collection for the women and children under their care. In Cape Town two receiving officers have been appointed at the magistrate's office, to whom these orders are paid, and the receipts run into £800 to £900 per month.

(n) *Dental Clinics.*—Many of the societies in the Cape Province are arranging for free dental treatment for children.

(o) *Play Centres.*—A recent development in Cape Town is the establishment of play centres at schools in the poorer districts of the city, where organized games and occupations are supervised by voluntary workers.

(p) *Fresh-Air Camps.*—Parties of poor children from the overcrowded areas of Cape Town are housed at the seaside during the summer months. Public support has been generously accorded to this activity.

(q) *Future Development.*—The organizations have in view the pressing need for the establishment of children's hospitals and nursery schools, especially in the larger centres of population. The future work of the various societies forms the subject of discussion at the Child Welfare Conferences.

Among the resolutions passed at the Fourth Child Welfare Conference held at Bloemfontein in September, 1920, was one for the federation of all Child Welfare Societies in the Union, in order to secure better co-operation in the work. This was accomplished as a result of the Sixth Conference held at Cape Town (March, 1924), when a national organizing secretary was appointed and a National Council for Child Welfare was established. All Child Welfare Societies have become affiliated to the National Council Union (as well as other bodies working in the interests of Child Welfare). There are eighty-seven members on the Council, which meets at least once a year. The Union Department of Education contributes £250 per annum towards the general expenses of the Council.

2. **Children's Protection Act.***—This Act (No. 25 of 1913), which is based largely on the provisions of the United Kingdom *Children's Act* of 1908, is designed to consolidate and amend existing laws so as to provide for the better protection of children under the age of sixteen years. The administration of the law is vested in the Union Department of Education, since September, 1917. A summary of the provisions of this enactment and of the amending Act (No. 26 of 1921) will be found in the sixth and previous issues of this *Year Book*.

3. **Adoption of Children Act.**—This Act (No. 25 of 1923) came into force on 1st January, 1924, and its administration has been entrusted to the Minister of Education. Application for an order of adoption must be made to the magistrate of the district in which the child to be adopted resides. The parents must give consent to the adoption and the child, if over the age of ten, must also give consent. If the child is deserted by the parents a guardian can be appointed by the Minister to give consent. All orders of adoption are registered in the office of the Registrar of Adopted Children, where all original papers dealing with the adoption are filed for record.

* Amended by Act No. 26 of 1921.

4. **Other Legislation:**—The provisions of the *Factories Act*, No. 28 of 1918, protect children employed in factories in a variety of ways. No child under 12 years of age may be employed in any factory; children under 14 years of age only under licence of a factory inspector; and children under 16 years of age only when certified physically fit for work. Hours and conditions of employment are also regulated.

The *Juveniles Act*, 1921, which is associated with the work of various Juvenile Affairs Boards in the Union, is administered by the Department of Labour, and provides for the "after-care" of children who have reached the school-leaving stage. Other legislation which has a bearing on the conditions of juvenile labour is the *Apprenticeship Act* of 1922 and the *Regulation of Wages, Apprentices and Improvers Act* of 1918 (see Chapter V).

§ 4. Liquor Laws.

1. **General.**—The liquor laws of the Union, in so far as they affect the European population, are based on English law and custom. It will be observed from the tables in the concluding paragraph that on the average there are in the Union twelve retail liquor licences and three bottle store licences in existence for every ten thousand of the European population.

The laws governing the supply of intoxicating liquor to coloured persons are framed in each Province to suit the conditions peculiar to each. These conditions vary so considerably and are based upon such divergent practice that there are formidable obstacles to the construction of a uniform law on this subject for the Union.

In the *Cape Province* for many years that portion of the coloured population which is brought into closest contact with Europeans has been accustomed to consume the wine and spirits manufactured by wine farmers and others. Until the product of the vine was brought up to the present standard, which enables it to compare favourably with similar products in Europe, by far the larger portion of the wine and brandy produced was consumed by the coloured population. At the present day in certain parts of the Province the practice still exists of issuing a ration of wine or spirits in part payment of wages due. Every registered Parliamentary voter is entitled to purchase intoxicating liquors without restriction. This provision does not, however, apply to the Transkeian Territories, which include the areas of East Griqualand, Tembuland, Pondoland, and the Transkei. Into these areas no liquor can be imported except under a permit from the magistrate of a district. No liquor can in these areas be supplied to a native except under permit.

In *Natal* there is total prohibition in the case of the coloured population, but licences are granted by the Provincial authorities to brew and sell kaffir-beer. There are forty-one such licences in force.

In the *Transvaal* licences to manufacture and sell kaffir-beer are granted by the Governor-General to large employers of native labour. Natives living in rural areas distant twelve miles from a town, a mine, or public digging are allowed to brew beer for their own consumption

In the *Orange Free State* a considerable revenue accrues through the issue of licences to hold beer gatherings. In arranging beer gatherings natives first obtain permission from the landowner and also secure the consent of the magistrate of the district. The issue of a permit is notified to the police. Little restriction is placed upon the issue of such licences, as the police make a point of attending such gatherings and making an inspection of passes, tax receipts, etc.

In the industrial areas of the Transvaal there is in existence a considerable illicit liquor traffic. In 1923, 429 Europeans and 672 non-Europeans were committed to prison under sentence for illicit sale of liquor to non-Europeans in the Union, and of these, 292 Europeans and 440 non-Europeans were sentenced in the Transvaal, in spite of the fact that in this Province the minimum sentence is six months' imprisonment with hard labour for a first offence, and for repeated offences the penalty may range up to four years' imprisonment. It is a recognized fact that large numbers of residents in the Transvaal trade illicitly in liquor as a means of livelihood, and the problem of dealing with the question has provided almost insuperable difficulties. A proposal has been made in Parliament to facilitate the sale to natives in the Transvaal of light Cape wines, in the hope that by this means the illicit traffic evil may be abated. The sale of kaffir-beer has also been urged as a comparatively innocuous liquor, rarely containing more than 3 per cent. of alcohol. This beer forms the natural beverage of the Bantu race, and is prepared from kaffir-corn, a species of millet.

The following table gives figures of liquor and bottle store licences issued in the various Provinces of the Union over a series of years. Particulars of convictions for drunkenness are also included; details as to other offences under the liquor laws are given in Chapter IX.

LIQUOR TRAFFIC, 1915 TO 1924.

Year.	Retail Liquor Licences.	*Europeans over 15 years per Licence.	Bottle Stores.	*Europeans over 15 years per Licence.	Convictions: Drunkenness. ‡

* Includes coloured persons in the Cape Province only. † Not available.
‡ Including, for years 1922, 1923, and 1924 persons who estreated bail.

2. **Temperance Movement.**—A note on the development and further activities of the temperance movement in South Africa will be found in previous issues of the *Year Book*. Recent efforts towards legislative reform in reference to the liquor traffic have been organized mainly by the South African Temperance Alliance, an association which aims at co-ordinating the efforts of all the churches and of all the various temperance organizations in South Africa, particularly with a view to legislation.

A Local Option Bill was introduced in 1913 by the late Senator Schreiner, and eventually carried through the Senate under his leadership in 1917, but the same Bill was thrown out of the Assembly by 57 votes against 26. War conditions and other difficulties prevented the resumption of the local option movement in Parliament until 1922, when Dr. Malan's Liquor Option Bill was introduced, coming eventually to a vote in March, 1923, and being defeated by 56 votes against 41. In 1924 the Local Option Bill was reintroduced by Mr. Leslie Blackwell, but it was defeated on the second reading by 53 votes against 51, and in the present newly elected Parliament was again defeated in 1925 by 56 votes against 47. As an outcome of the visit of Mr. W. E. Johnson, who toured South Africa in 1923 on the invitation of the Temperance Alliance and lectured on the results of prohibition in America, a Local Option Congress, convened by the leaders of the temperance movement in the Dutch Reformed Churches in co-operation with the South African Temperance Alliance, was held at Cradock in December, 1923.

§ 5. Divorces.

1. **Return of Divorces.**—Particulars are given in tables (i) and (ii) of the number of divorces, judicial separations, and decrees of nullity of marriage in respect of Europeans over a number of years, and in tables (iii), (iv), (v), (vi) and (vii), more detailed information regarding divorces petitioned for during a series of years.

(i) DECREES OF DIVORCE, JUDICIAL SEPARATION, AND NULLITY OF MARRIAGE GRANTED (EUROPEANS ONLY), FROM 1914.

§ 6. Miscellaneous.

1. **Natural and Historical Monuments.**—Act No. 6 of 1923 makes provision for the preservation of the natural and historical monuments of the Union and of objects of aesthetic, historical, or scientific interest. The Act embraces within its scope areas of land having distinctive or beautiful scenery, and more specifically, waterfalls, caves, avenues of trees, old trees, old buildings, and Bushman paintings. Provision is made for the establishment of a Commission of not less than seven members to carry out the objects of the Act. The funds of the Commission are derived from donations, fees, and annual subscriptions, and its duties include the framing of a register of monuments which ought to be preserved. The Commission may take steps for the preservation of such monuments, and may purchase any monument if it has the funds for the purpose and can secure the consent of the owner. It may also act as trustee of any monument and accept, as trustee for the Union, any monument donated or bequeathed to the Union. Penalties may be imposed for the disfigurement or destruction of any monument.

Under Act No. 22 of 1911, Bushman-relics may not be removed from the Union without the written authority of the Minister of the Interior.

2. **Prevention of Cruelty to Animals.**—The law relating to the prevention of cruelty to animals is contained in Act No. 8 of 1914, which consolidated various Provincial laws in force at the time. Persons guilty of certain offences defined by the Act as amounting to cruelty to animals are liable to imprisonment (with or without the option of a fine not exceeding £25) for a period not more than three months, with or without hard labour. Animals which have been subject to cruelty may be destroyed or otherwise disposed of as the court may direct. A society for the prevention of cruelty to animals may be authorized to institute prosecutions under the Act, and officers of such a society may be granted police powers under the Act within particular areas.

3. **Public Holidays.**—The following are the statutory public holidays of the Union as prescribed in Act No. 3 of 1910 :—

New Year's Day.
Good Friday.
Easter Monday.
Ascension Day.
Victoria Day (24th May).
Union Day (31st May).
King's Birthday (first Monday in August).
First Monday in October.
Dingaan's Day (16th December).
Christmas Day.
Boxing Day (26th December).

When any of these days fall on a Sunday, the following Monday is observed as a public holiday. When Boxing Day falls on a Monday the following Tuesday is regarded as a holiday. Sundays and the above-named days are deemed to be non-business days for bills of exchange and promissory notes.

CHAPTER IX.

ADMINISTRATION OF JUSTICE.

§ 1. Criminal Jurisdiction—Lower Courts.

1. **Magistrates' Courts.**—The Union *Magistrates' Courts Act* (No. 32 of 1917) lays down the following limits of punishments which may be imposed by a magistrate's court in any part of the Union :—

Ordinary summary jurisdiction :—
Fine not exceeding £50.
Imprisonment with or without hard labour not exceeding six months.
Whipping not exceeding fifteen strokes.

Increased jurisdiction by reason of remittal :—
Twice the above limits in case of fine or imprisonment.

The present *Criminal Procedure and Evidence Act* (No. 31 of 1917), which came into operation on the 1st January, 1918, and which is the main enactment in connexion with the administration of criminal justice, provides that boys under *sixteen* may receive a moderate correction by whipping in lieu of other punishments. This same Act provides also for other forms of punishment, such as in the case of adults detention in farm colonies or inebriate reformatories, and in the case of juveniles or juvenile adults, detention in a juvenile or juvenile adult reformatory, apprenticeship, binding over in recognizances, postponement or suspension of sentences, orders for compensation, caution, and reprimand.

Mention may also be made of the fact that in Natal, previous to the constitution of Union, "occasional courts or branch courts," and in the Cape, Transvaal, and Orange Free State "periodical courts" were held in each district at places some distance away from the seat of magistracy, for the convenience of the public. These courts possessed the same jurisdiction in all respects as those held at the seat of magistracy. This practice is recognized under the new Act (No. 32 of 1917), and all such branch courts are known as "periodical courts," and possess the same criminal jurisdiction as those courts which are held at the seat of magistracy.

The *Magistrates' Courts Act*, 1917, was applied to the mandated territory of South West Africa by Proclamation No. 52 of 1921, issued by the Administrator of that territory under the powers delegated to him under Act No. 41 of 1919 of the Union Parliament.

2. **Courts of Special Justice of the Peace.**—The Union Act, No. 2 of 1918, consolidates the law relating to the appointment and jurisdiction of special justices of the peace.

In the first place jurisdiction is given by section 3 and the First Schedule to the Act over all statutory offences for which the *maximum* penalty does not exceed a £25 fine, or three months' imprisonment, or both. Such offences are usually of a petty nature. Also, this section and Schedule in effect re-enact, in a briefer form, much of the existing legislation upon the subject. In the Orange Free State alone jurisdiction is given in respect of more than twenty statutes or fractions of statutes which are at present separately enumerated in the body or schedule of several Acts extending the jurisdiction of special justices of the peace [First Schedule (1) of Act].

Secondly, jurisdiction is given in respect of those common law offences such as petty thefts and assaults, which were originally subjects of trial by a special justice of the peace. This presents no difficulty, as the jurisdiction in this respect is practically the same in all the three Provinces which have special justices of the peace [First Schedule (2) (3) (4)].

Thirdly, jurisdiction is given in certain classes of offence which may be roughly classified as rural, e.g. offences in respect of pounds, preservation of game, etc., upon the assumption that the function of a special justice of the peace is mainly to provide for the comparatively simple wants of the countryside. A complete list of these classes of offence

is contained in sub-division (8) of the First Schedule to the Bill. Jurisdiction is also given in respect of contraventions of by-laws [First Schedule (6)].

Fourthly, jurisdiction is given in respect of contraventions of regulations made under the *Native Labour Regulations Act*, No. 15 of 1911, section 23 (1), paragraphs (*i*), (*j*) and (*k*), First Schedule (7).

Finally, in master and servant cases, special justices of the peace are given without restriction the full jurisdiction of a magistrate. This does not increase the punishment which a special justice of the peace may impose, except in the single case of forging a false certificate of character. There are many provisions in the *Master and Servant Acts* as to matters other than the imposition of fine and imprisonment, e.g. the making of orders for the payment of wages (section 3).

Besides this increase in master and servant jurisdiction, the plan adopted has resulted in an incidental increase in some other matters. For example, in the Transvaal special justices of the peace have jurisdiction over all contraventions of Act No. 23 of 1907 (Registration and Control of Dogs), except contraventions of section 7 (3) of that Act, which deals with forgery of dog badges and provides a penalty of two years' imprisonment. The language employed in the Act covers the whole of this statute, including section 7 (3) of that Act. This extension is, however, more apparent than real, since by the proviso to section 3 (1) of the Act a special justice of the peace cannot inflict a greater punishment than a fine of £10 or one month's imprisonment. Any risk that a serious offender might escape with an inadequate punishment by being prosecuted before a special justice of the peace for a serious offence is obviated by section 5 of the Act, which empowers the special justice of the peace, if he discovers the offence to be beyond his jurisdiction, or, though within his jurisdiction, of such a nature as not to be suitable for trial by him, to transmit the proceedings to the magistrate to be dealt with according to law, i.e. to be commenced afresh under the *Criminal Procedure Act*.

By section 3 (2) of the Act, special justices of the peace have been given the same jurisdiction as has been given to magistrates to sentence to whipping male offenders under sixteen years of age.

The Act gives a special justice of the peace jurisdiction to make an order for costs against an offender or complainant, in addition to the fine or imprisonment imposed in the case of an offender (see also s. 23 of the *Criminal Procedure and Evidence Act*, 1917, as to private prosecutions). The Act also authorizes a special justice of the peace to order an offender to make compensation and restitution (see also Ch. XIX of *Criminal Procedure and Evidence Act*, 1917).

Section 3 (1) of the Act is so drawn as to prevent any special jurisdiction being exercised under existing laws in the case of special justice of the peace courts.

As regards the appointment of special justices of the peace and therefore the circumstances which give rise to the constitution of such courts, the Act (s. 1) sets the limit at twenty miles from the seat of magistracy of a district or sub-district.

Magistrates' courts possess either appellate or review jurisdiction in respect of the criminal proceedings held before courts of special justice of the peace. Under the new *Special Justice of the Peace Act*, records of all criminal proceedings before a special justice of the peace will be transmitted to the local magistrate for review. He will possess on such review like powers to those possessed by a provincial division of the Supreme Court in the review of a decision of a magistrates' court. The Act also provides for an appeal to the magistrate's court against a conviction or sentence by a special justice of the peace, with a further appeal to the provincial or local division of the Supreme Court having jurisdiction.

3. **Courts of Native Commissioners and Sub-Commissioners.**—The courts of native commissioners and sub-commissioners exist only in the Transvaal. They were constituted by Ordinance No. 3 of 1902, immediately after the termination of the South African war. No limitation is placed upon the number of such officials who may be appointed, but in practice, where the appointment of a native commissioner is considered advisable in any district, the magistrate acts as such, while sub-commissioners are officers of the Department of Native Affairs, and only exist in districts where it is deemed advisable for the magistrate to act as native commissioner.

The jurisdiction of a native commissioner and of a sub-commissioner is as follows :—

(i) The jurisdiction conferred by Law No. 4 of 1885 in connexion with civil disputes in which white persons are involved with tribal natives (Ordinance No. 3 of 1902, s. 2). Further reference is made to this under the heading "Civil Jurisdiction"—§ 3 (3) of this Chapter.

(ii) The summary jurisdiction (but in respect only of offences committed by natives within the commissioner's area of jurisdiction) which a magistrate's court possesses in respect of any offence under the Magistrates' Courts Law and the convictions and sentences of a court of native commissioner or sub-commissioner are subject to the same law as to review and appeal as the law governing reviews of and appeals from a decision of a magistrate's court in a criminal case.

(iii) As indicated above, the native commissioner and sub-commissioner is *ex officio* a resident justice of the peace within the district for which he is appointed, exclusive of an area of twenty miles from the seat of magistracy. As such, therefore, he has the criminal jurisdiction of a resident justice of the peace.

§ 2. Criminal Jurisdiction—Superior Courts.

1. **Divisions of the Supreme Court.**—Part VI of the *South Africa Act* (s. 95 to s. 112) left the superior courts of the Union in precisely the same position as regards criminal jurisdiction as before the establishment of the Union. All that was changed was the nomenclature. A Supreme Court of South Africa was constituted in name, and an Appellate Division thereof was created (s. 96); but to that division appeal lies on criminal matters from a judgment of a provincial or local division only after special leave to appeal to it has been given by the Appellate Division (s. 103 and s. 105). The three Supreme Courts of the Cape of Good Hope, Natal, and the Transvaal became provincial divisions of the new Supreme Court of South Africa; the High Court of the Orange River Colony became the Provincial Division of the Orange Free State; the Eastern Districts Court of the Cape became the Eastern Districts Local Division; the High Court of Griqualand became the Griqualand West Local Division; and the Witwatersrand High Court became the Witwatersrand Local Division. Circuit Courts in every Province also became local divisions of the Union Supreme Court.

2. **Jurisdiction.**—(i) *Provincial and Local Divisions.*—The several Supreme Courts, High Courts, and Circuit Courts have continued after the establishment of the Union to possess as provincial or local divisions (as the case may be) the same criminal jurisdiction which they had previously possessed. In other words, presided over by a judge, and with a jury to determine questions of fact, such a superior court had before the establishment of the Union, and has now, practically unlimited criminal jurisdiction within the area for which it was constituted. This jurisdiction, except in very special cases, comes into operation on presentation to the court of an indictment by the Attorney-General of the Province, or in the case of the Eastern Districts Court, an indictment by the Solicitor-General; and such indictment is presented after the accused has been committed for trial by a magistrate holding in a semi-judicial and semi-administrative capacity an inquiry called a preparatory examination.

The existing jurisdiction of these superior courts has been indirectly confirmed by the Union Parliament in section 4 of the *Criminal Procedure and Evidence Act*, 1917, which lays down that the jurisdiction of the several superior courts in respect of the trial of persons accused of any offence, is prescribed in the laws severally relating to the constitution and jurisdiction of those courts. The same Act recognizes two other classes of superior court for the trial of criminal cases, (*a*) the Native High Court of Natal as a permanent court, and (*b*) a special criminal court constituted by the Government *ad hoc* on the request of the Attorney-General for the trial of certain classes of cases where there is ground to believe that the ends of justice may be defeated by a trial before a jury.

The statutes conferring criminal jurisdiction on the provincial and local divisions described above are as follows:—*Cape:* The Charter of Justice, sections 30 and 39. Ordinance No. 40 of 1828, sections 1, 2, and 3. Act No. 35 of 1896, section 13 as to the Eastern Districts. Act No. 39 of 1877, section 10 as to the Griqualand Local Division. *Natal:* Act No. 39 of 1896, sections 6, 7, and 8. *Transvaal:* Ordinance No. 10 of 1903, sections 1 and 6. *Orange Free State:* Ordinance No. 4 of 1902, sections 3 and 21.

(ii) *Native High Court, Natal.*—The Native High Court of Natal, as at present constituted, derives its jurisdiction from Act No. 49 of 1898 of Natal (s. 29 to s. 31), as amended by Act No. 47 of 1901 (s. 5 and s. 6), and as further amended by Act No. 30 of 1910 (Natal, s. 1 to s. 2). The court consists of a judge-president and three other judges, and tries serious criminal cases where the accused are natives. By the amending legislation its jurisdiction in such cases was extended so as to exclude that of other courts, and to include jurisdiction in capital cases also against natives.

(iii) *Circuit Courts.*—These Courts were established by various pre-Union laws and in the Cape, Transvaal, and Orange Free State are held at such places and on such days as the Governor-General may approve on the recommendation of the Judge-Presidents and Judges of the Provincial Divisions of the Supreme Court concerned. One or more Magisterial Districts may form a Circuit District, and the grouping of Magisterial Districts into Circuit Districts is subject to alteration from time to time. Descriptions of Circuit Districts and the places and days for holding of Circuit Courts are published in the *Government Gazette* from time to time.

The *Cape Province* is divided into two Circuits (those for the Western and Eastern Districts). Each is held twice annually, commencing in March and September.

The *Transvaal* is divided into two Circuits (those for the Western and Eastern Districts). Each is held twice annually. The Western Circuits usually commence in May and October and the Eastern Circuits in March and August.

Two Circuits are held annually for the various Districts in the *Orange Free State.* These Circuits usually commence in March and September. In *Natal* the law provides for the holding of Circuits when necessary at centres prescribed by the Supreme Court. Circuit Court is held regularly at Durban, but no Circuits have been held elsewhere since 1914.

Full Court and single Judge Circuits for the trial of all classes of cases against natives are held at regular intervals by the *Native High Court* during each year at towns and on days prescribed by Rules of Court.

(iv) *Special Criminal Courts.*—The special criminal court originated in a provision of Act No. 27 of 1914, whereby in the circumstances above described charges of treason, sedition, public violence, and certain offences arising out of industrial disputes, might be dealt with by two or three judges without the aid of a jury. That provision was utilized in 1915 for the trial of numerous charges of treason and sedition arising out of the rebellion of 1914, as well as several charges of public violence arising out of the anti-German riots. In re-enacting the provision in Chapter XII of the *Criminal Procedure and Evidence Act*, 1917, the legislature added to these classes of offences contraventions of laws for the prevention of illicit dealing in and possession of precious metals, precious stones, and of the supply of intoxicating liquor to natives or coloured persons. This special court was again utilized in 1922 and 1923 for the trial of numerous cases of treason and sedition arising out of the disturbances on the Witwatersrand in March of 1922. Further, when the Attorney-General of the Transvaal certified that acts alleged to constitute the offence of murder, assault with intent to commit murder, assault with intent to do grievous bodily harm, arson, or of malicious injury to property were committed in connexion with those disturbances or in connexion with the industrial dispute from which the disturbances arose, and in a district then placed under martial law, this special court was, by Act No. 6 of 1922, (s. 4) given jurisdiction to try the charges of any such offence.

3. **Jurisdiction under Act No. 31 of 1917.**—Under the *Criminal Procedure and Evidence Act*, No. 31 of 1917, the superior courts continue the practice of trying indictments presented by the Attorney-General, or (in the Eastern Districts of the Cape) by the Solicitor-General. A superior court also tries an indictment presented—but presented only rarely—by one of that limited class of persons who are empowered to institute private prosecutions after the Attorney-General (or Solicitor-General) has certified that he declines to prosecute. The indictments are presented after consideration of preparatory examinations and the committal of the accused for trial by a magistrate. Except in the case of the Native High Court and the Special Criminal Court in the circumstances above described—and with one further exception (see below)—the trial is conducted before a jury of nine men, of whom seven at least must be unanimous as to the verdict returned. This limitation on absolute unanimity is a modification of the law in the Cape and the Orange Free State. After a verdict, the court is limited as to the punishment by the provisions of the common law as to the offence, or in case of a statutory offence, by the terms of the statute creating the offence. But subject to the common law or the statute, the court *must* impose the death sentence on convictions for murder except where the accused is a woman convicted of the murder of her newly-born child or is a person under sixteen years of age, and it *may* impose the death sentence on a conviction for treason or for rape. In other cases the court may, subject to the common law or the particular statute concerned, impose fine or imprisonment or whipping or all such punishments, and may also impose those special classes of detention and punishment which are described above in connexion with magistrates' courts. On a third conviction for certain scheduled offences, a superior court may declare the offender to be an habitual criminal, and impose upon him an indeterminate sentence.

The other exception to trial before a superior court without a jury is contained in section 216 of the *Criminal Procedure and Evidence Act*, whereby a judge must on notice and application by the accused try him without a jury, and may in his discretion call to his assistance as assessors on fact two persons being magistrates, native commissioners or sub-commissioners, or justices of the peace. Under this section, the Judge-President of the Eastern Districts in 1921 tried without a jury at Queenstown the charge of public violence preferred against certain natives ("Israelite" sect) in connection with the well-known Bulhoek affair

4. **Appellate Jurisdiction.**—The decisions of superior courts in the trial of criminal cases are, under section 368 of the *Criminal Procedure and Evidence Act*, 1917, subject to the appellate jurisdiction of the Appellate Division of the Supreme Court constituted under section 96 of the *South Africa Act.* In the case of the Natal Native High Court, this jurisdiction may be on both fact and law, though on points of law the provincial division of Natal exercises an intermediate jurisdiction on questions specially reserved. In the

cases of the provincial and local divisions, the jurisdiction of the Appellate Division in criminal cases is limited in practice to decisions on points of law. Such jurisdiction may be exercised on application for (*a*) arrest of judgment on the ground that the indictment discloses no offence; or (*b*) on the consideration of a special entry on the record made on the application of the accused or his counsel, in which an allegation of irregularity or illegality in the proceedings is made, the nature of which is indicated; or (*c*) on questions of law reserved at the trial for the consideration of the Appellate Division by the presiding judge either on his own motion or at the request of the prosecution or of the defence. The Appellate Court may either confirm the judgment of the trial court, or set it aside, or remit the case to the court below for judgment to be given, if it has not already been given, or itself give such judgment as ought to have been given, or make such other order as justice may require (s. 374).

As regards the decisions of magistrates' and other inferior courts in criminal cases, appeals against which are heard and determined, as described below, by the provincial and local divisions, the Appellate Division only exercises jurisdiction when special leave to appeal has been given by it from the judgment on appeal of the provincial or local division (*South Africa Act*, s. 105). One exception must be made to this statement. Under section 5 of Act No. 1 of 1911 the Appellate Division, if both the prosecutor and accused agree in writing, has jurisdiction to hear and determine a criminal appeal without any intermediate appeal being heard by a provincial division.

As above indicated, every decision involving a conviction in a criminal case by a magistrate's court, whether on law or fact and whether against the conviction or against the sentence passed, is subject to an appeal by the convicted person to the provincial division within the area of jurisdiction covering the magistrate's court, or if the court sat within the area of jurisdiction of the Griqualand West Local Division, is subject to appeal to that division, or, if it sat within the area of jurisdiction of the Eastern Districts Local Division, is subject to appeal to that division. The court to which such an appeal lies may affirm, alter, or reverse the conviction, or may affirm, reduce, or vary the sentence imposed, or may set aside or correct the proceedings of the magistrate's court, or remit the case to that court with such instructions relative to the taking of further evidence and generally as to any further proceedings to be taken as the Appellate Court may think fit to give. [S. 100 as read with section 95 (2) of Act No. 32 of 1917.]

In addition to the appeal jurisdiction of the provincial and local divisions, Chapter XIV of Act No. 32 of 1917 confers upon them a special jurisdiction to review the proceedings of any magistrate's court whenever a sentence of (*a*) imprisonment or other form of detention exceeding three months is imposed, or (*b*) a fine exceeding £25 is inflicted, or (*c*) whipping is ordered as a punishment except in the case of boys under sixteen years. The records are sent by the magistrate to the registrar of the provincial or local division concerned and submitted by the latter for consideration of a judge in chambers, who, if satisfied that the proceedings are in accordance with real and substantial justice, gives his certificate to that effect. Otherwise the case is dealt with in open court, which possesses the same powers as it possesses on appeal, and may direct the case to be argued. (S. 93 to s. 95 of Act No. 32 of 1917.) It was not till Act No. 13 of 1921 was passed (see s. 4) that this review jurisdiction was possessed in respect of *native cases* by the provincial division of Natal.

The only appeal by the Crown in any criminal case in a magistrate's court is when a criminal summons or charge is dismissed on exception or on the ground that it is bad in law or that it discloses no offence. In such case the Attorney-General may appeal against such dismissal [s. 100 (2) of Act No. 32 of 1917]. The Attorney-General may also under section 106 of the same Act bring the decision of a magistrate's court in a criminal case in review before the provincial division. The provincial division's ruling on such review does not affect the decision in the particular case, but serves for future guidance of magistrates' courts.

As indicated in § 1 (3) above, the decisions in criminal cases of native commissioners and sub-commissioners in the Transvaal are subject to appeal to or review by the provincial division, just as those of a magistrate's court; and the provincial division may make like orders on any such appeal.

In addition, every provincial division under the statute under which it may have been constituted prior to the constitution of the Union, has jurisdiction to review the proceedings of any inferior court on the ground that such inferior court has exceeded its jurisdiction or has been guilty of gross irregularity or has admitted illegal or incompetent evidence or rejected legal and competent evidence or has shown malice or corruption.

5. **Advocates, Attorneys, etc.**—The subjoined table gives the number of advocates, attorneys, notaries, and conveyancers admitted into the several divisions of the Supreme Court during 1924, and the total number on the roll at the 31st December of that year.

Under Act No. 7 of 1923, women are entitled to practise and be enrolled as advocates, attorneys, etc., in any Province of the Union on the same terms and conditions as apply to men.

ADMISSIONS OF ADVOCATES, ATTORNEYS, ETC., INTO DIVISIONS OF SUPREME COURT, 1924.

* Including Advocates and Attorneys practising in dual capacity; in previous years these were included under both Advocates and Attorneys.

§ 3. Civil Jurisdiction—Lower Courts.

1. **Magistrates' Courts.**—Up to the 1st January, 1918, the civil jurisdiction of magistrates' courts rested upon and was determined by the provisions of that considerable number of statutes to which reference has been made in describing the criminal jurisdiction of these courts. On the 1st January, 1918, the new consolidating and amending *Magistrates' Courts Act* (No. 32 of 1917) came into operation, and imposed uniformity in the jurisdiction of these courts throughout the Union.

The Act confers upon a magistrate's court jurisdiction (s. 29)—

(*a*) in actions in which is claimed the delivery or transfer of any property movable or immovable not exceeding £200 in value;
(*b*) in actions of ejectment against the occupier of land or premises within the district if the right of occupation does not exceed £200 in clear value to the occupier;
(*c*) in other actions (except those specifically excluded) where the claim or value of the matter in dispute does not exceed £200.

The following classes of actions, however, are specifically excluded from the jurisdiction of the magistrate's court, however little may be the amount at stake, viz., actions for or concerning—

(*a*) divorce and judicial separation;
(*b*) the validity and interpretation of wills and testamentary documents;
(*c*) status of persons in respect of mental capacity;
(*d*) specific performance or acts without alternative of damages, except as to rendering of accounts or delivery of property not exceeding £200;
(*e*) decree of perpetual silence;
(*f*) provisional sentence.

Except as to these specially excluded actions, a magistrate's court may acquire jurisdiction by the written consent of both parties, whatever may be the amount or value in dispute.

Incidental to all this jurisdiction in civil matters a magistrate's court may issue orders of personal arrest of persons suspected of absconding, attachment of property, interdicts prohibiting the removal of furniture which is subject to the landlord's hypothec for rent, and may enforce its payments not only by execution against movables primarily and afterwards against immovable property which is not subject to prior charges, but also by civil imprisonment, garnisheeing or attachment of debts due from third persons, and by order for payment in instalments.

Appeals lie to the provincial division of the Supreme Court from final judgments, or orders having the effect of finality, and from decisions over-ruling exceptions; the

Griqualand West and the Eastern Districts Local Divisions having concurrent jurisdiction with the Cape Provincial Division in respect of decisions of courts within the respective areas of jurisdiction. The parties, may, however, agree in writing before the hearing that there shall be no appeal, and that the judgment of the magistrate's court shall be final. Formerly appeal lay from a magistrate's court to a circuit court, except in the Transvaal. This is no longer possible under the present Act.

The *Magistrates' Courts Act*, 1917, has been applied to the mandated territory of South-West Africa.

2. **Courts of Special Justice of the Peace.**—These courts have possessed no civil jurisdiction in any Province under their respective laws. The *Special Justices of the Peace Act*, No. 2 of 1918, gives these courts, when sitting more than twenty-five miles from any place where a magistrate's court is held (whether as a periodical court or at the seat of magistracy), jurisdiction to try a civil action in which is claimed a liquidated sum not exceeding £25; but if the sum claimed exceeds £5 the defendant can insist on having the action removed to the magistrate's court. Appeals in civil matters from a court of special justice of the peace lie as in criminal matters to the magistrate's court, with a further appeal to the provincial division of the Supreme Court.

3. **Courts of Native Commissioners.**—The courts of Native Commissioners or Sub-Commissioners in the Transvaal have certain civil jurisdiction (though not exclusive jurisdiction) by virtue of Ordinance No. 3 of 1902 and Law No. 4 of 1885 (s. 4), to decide civil disputes between native and native belonging to tribes in the neighbourhood or at the suit of a European against a native of such a tribe. An appeal lies to the Transvaal Provincial Division against the decision of the native commissioner or sub-commissioner as if it were a decision of a magistrate's court.

4. **Record of Civil Cases, Inferior Courts.**—The collection of statistics under this head was suspended for financial reasons on the 31st December, 1921. The data for their preparation were received for 1921, but tabulation was not proceeded with. Full particulars for 1920 will be found in the fourth issue of this *Year Book*.

§ 4. Civil Jurisdiction—Superior Courts.

1. **Provincial and Local Divisions.**—The manner in which the several superior courts, viz., the Appellate Division, the Provincial Divisions, and the Local Divisions (including circuit courts) came into being at the establishment of the Union, by virtue of Part VI of the *South Africa Act*, is described above (§ 2). A provincial and a local division (otherwise known as a superior court) has, in addition to any original jurisdiction exercised by the corresponding court of the Colonies at the date of the establishment of Union, jurisdiction in all matters in which the Government of the Union or a person suing or being sued on behalf of such Government is a party or in which the validity of any provincial ordinance comes into question [*South Africa Act*, 1909, section 98 (31)]. Generally it may be said that a provincial division in each Province has unlimited jurisdiction throughout the Province in respect of all causes or matters arising within that area; while each local division has jurisdiction (slightly restricted in some respects) in regard to causes arising and persons residing within its defined area. For example, the Witwatersrand Local Division, while it has concurrent jurisdiction with the provincial division so long as the cause or matter arises within its defined limits, is expressly excluded from exercising any appellate jurisdiction or from reviewing the proceedings of inferior courts (Proclamation No. 14 of 1902, s. 27), and in regard to insolvency and certain other matters its jurisdiction is that of a circuit court only. The Eastern Districts Local Division has certain appellate and review jurisdiction (see § 2 above), but in regard to insolvency, registration of title, administration of estates, and certain other matters, its jurisdiction is limited to that of a circuit court only (Act No. 35 of 1896, s. 25). The limitations placed upon the Griqualand West Local Division are the same as those placed on the Eastern Districts Local Division (Act No. 39 of 1877, s. 10, and Act No. 35 of 1896, s. 18).

Special jurisdiction is given to any provincial division in which a parliamentary or provincial council election is held (but not to a local division), to try election petitions, i.e. petitions complaining of an undue return or undue election of a member, by reason of want of qualification, disqualification, corrupt or illegal practice, irregularity, or any other cause whatever. (See Chapter V of Act No. 12 of 1918.) In the trial of election petitions by *any* provincial division under Chapter V of Act No. 12 of 1918, the quorum consists of not less than three judges, though one judge may adjudicate on an interlocutory application other than an application for the withdrawal of a petition [Section 111 (i)].

The provincial divisions sit at Cape Town, Pietermaritzburg, Pretoria, and Bloemfontein respectively, the Cape of Good Hope Division consisting of five judges, the Natal Division of four judges, the Transvaal Division of seven judges, and the Orange Free State of three judges. The Eastern Districts Local Division consists of three judges; the

Griqualand West Local Division of one judge; and one judge of the Provincial Division may preside over any sitting of the Witwatersrand Local Division.

In all the Cape divisions, the court may sit with one judge only as a divisional court, and under Act No. 10 of 1917 as many divisional courts as there are judges available to preside may sit at the same time for the dispatch of civil business. In the Transvaal Provincial Division (except in vacation time, when one judge constitutes a quorum) the quorum of the court is two, except in motions, applications, and trial cases where the defendant is in default, when one judge sitting in chambers constitutes the court. By Ordinance No. 31 of 1904 (s. 1), however, a divisional court of one judge may exercise the civil jurisdiction of the court in any trial action if both parties consent, or if the action is remitted to such a divisional court for trial by order of the full court. A like provision exists as regards the Natal Provincial Division [Act No. 39 of 1896 (Natal), s. 9], and as regards the Orange Free State Provincial Division by Act No. 11 of 1921. In Natal also, one judge sitting in chambers, or the like, may exercise all the powers of the full court except in arguments on exceptions to pleadings, applications for new trials, objections to accounts in insolvency, and in the administration of estates, rehabilitations in insolvency, and in trials not falling within section 9 of the Act. In those cases the full court is necessary.

In the Orange Free State Provincial Division the quorum in civil proceedings is as in the Transvaal, both as to term, time, and vacation (Ordinance No. 13 of 1904, s. 4 and s. 5, and Act No. 11 of 1921).

Further provisions as to jurisdiction, transfers of suits, etc., are as follows:—

(*a*) By section 112 of the *South Africa Act*, the judgment or order of any one division of the Supreme Court may be enforced outside the area of jurisdiction of such division, by lodging with the registrar of the provincial division having jurisdiction in the place where it is desired to enforce the judgment, an authenticated copy of the judgment or order. The registrar, on proof that the judgment or order is still unsatisfied, will issue process for the execution thereof, and such process will be executed as if it had been issued originally from that division.

(*b*) Any provincial or local division may, under section 113 of the *South Africa Act*, transfer a civil suit to another division when it is satisfied that it can be more conveniently or fitly heard or determined in that other division, and that this division will proceed with the suit as if it had originally been commenced therein.

(*c*) By section 3 of Act No. 27 of 1912, a civil process for commencing civil proceedings may, subject to compliance with certain forms, be served throughout the Union upon any defendant who resides or is for the time being in the Union, and is subject also to the jurisdiction of the Court.

(*d*) When a defendant resides in the Union, it is provided by section 5 of Act No. 27 of 1912 that no attachment of his person or property to found jurisdiction is to be ordered, and if service of a summons can be effected in any other way, no service of a civil summons on a defendant by way of edictal citation is to be authorized.

(*e*) A writ of arrest of the person, issued out of any superior court in connection with civil proceedings, may be executed thoughout the Union by transmitting the writ to the proper officer at the place where the person to be arrested resides or is for the time being.

2. **Appellate Division.**—In addition to the provincial and local divisions, there exists as indicated above, in § 2 (4), the Appellate Division of the Supreme Court. This division was created by section 96 of the *South Africa Act*, and now, since the passing of Act No. 12 of 1920, consists of the Chief Justice of South Africa and four judges of appeal. Its work as a court of criminal appeal is described in § 2 (4). It is, however, chiefly occupied in the final determination of civil causes and matters. It may here be mentioned that it succeeded to the jurisdiction of the old Cape Supreme Court as a court of appeal from the High Court of Southern Rhodesia. Further jurisdiction was conferred upon it by section 4 of Act No. 12 of 1920, to hear and determine appeals from orders or judgments of the newly constituted High Court of South-West Africa. As regards civil appeals from courts of the Union, appeals which before the establishment of the Union lay to the Supreme or High Courts of the late Colony go direct to the Appellate Division, except in the case of appeals against interlocutory orders of a single judge, orders on application, motions or petitions, judgments on summonses for provisional sentence, and judgments as to costs only. Those excepted matters are still subject to appeal, first to the provincial division, unless, under section 5 of Act No. 1 of 1911, the parties have agreed to go direct to the Appellate Division and dispense with an intermediate appeal. Where before the establishment of the Union an appeal lay to the Privy Council the appeal now only lies to the Appellate Division, whose decision is final, unless the Privy Council itself grants special leave to appeal to it from

the Appellate Division's decision (s. 104 and s. 105 of the *South Africa Act*). The Judicial Committee of the Privy Council has intimated that it will, as a general rule, only grant such leave in civil cases when the matter in issue is of some constitutional importance.

While before the establishment of the Union there must have been a certain amount at stake to enable any person to appeal as of right to the Privy Council, the substituted right of appeal to the Appellate Division is not limited by reason of the amount or value in dispute. Appeals to provincial or local divisions on judgments of inferior courts cannot be taken further to the Appellate Division unless the latter gives special leave. A special appellate jurisdiction in the matter of decisions of a provincial division at the trial of an election petition is conferred on the Appellate Division by Act No. 12 of 1918 (s. 132); but the leave of the Appellate Division must first be obtained.

The quorum of the Appellate Division is five when the appeal is from a court of two or more judges, and three when the appeal is from the decision of one judge (*South Africa Act*, s. 110). In vacation time one judge of the Appellate Division may hear and determine applications for special leave to appeal or for leave to proceed *in forma pauperis*, or for any interlocutory order (Act No. 1 of 1911, s. 6).

The process of the Appellate Division runs throughout the Union. As all its judgments have full effect in every Province, it naturally follows that they must be executed as if they were original judgments or orders of a provincial division (*South Africa Act*, s. 111).

The Chief Justice and judges of the Appellate Division, as judges of the Supreme Court of South Africa, collaborate with the judges of the other divisions in framing rules of court for the conduct of the proceedings in any provincial or local division.

§ 5. Source, Development, and Nature of the Law of South Africa.

Apart from statute, the law of South Africa as it exists to-day is essentially the *Roman-Dutch* system. The exposition and development of that system, influenced by English law and local usage, has resulted in a symmetrical and lucid body of law, on the one hand, by virtue of its reverence for local usage, largely freed of those provisions which the general consensus of a more enlightened age has disapproved, and on the other hand showing a singular absence of those subtleties which not uncommonly accrue in the course of their development to systems of more recent origin. The gradual decadence of *Roman-Dutch Law* in other settlements into which it was introduced, which in 1916 led in British Guiana to legislation almost completely displacing it, has found no counterpart in South Africa where, under the impetus given by the creation of one Appeal Court for the whole Union, as well as for Southern Rhodesia and South-West Africa, it may confidently be expected to continue to provide a system pre-eminently suited to the conditions of the country.

An account of the historical development of the law of South Africa will be found in the sixth and earlier issues of this *Year Book*.

§ 6. Union Department of Justice.

1. **Constitution of Department.**—A Ministry of Justice was created at the establishment of the Union, in substitution for the practice previously in force in each of the Colonies under which the Attorney-General had been a member of the Ministry, and had also assumed ministerial responsibility for the Law Department of the Colony. The system in force in the Union is that set out in section 139 of the *South Africa Act*, which is as follows:—

> The administration of justice throughout the Union shall be under the control of the Minister of State, in whom shall be vested all powers, authorities, and functions, which shall at the establishment of the Union be vested in the Attorney-General of the Colonies, save and except all powers, authorities, and functions relating to the prosecution of crimes and offences, which shall in each Province be vested in an officer to be appointed by the Governor-General-in-Council, and styled the Attorney-General of the province, who shall also discharge such other duties as may be assigned to him by the Governor-General-in-Council: Provided that in the province of the Cape of Good Hope the Solicitor-General for the Eastern Districts and the Crown Prosecutor for Griqualand West shall respectively continue to exercise the powers and duties by law vested in them at the time of the establishment of the Union.

The office of Crown Prosecutor for Griqualand West was abolished by section 13 of Act No. 27 of 1912, and his powers, authorities, jurisdiction, and duties conferred and imposed on the Attorney-General of the Cape of Good Hope.

Section 139 of the *South Africa Act* was for this reason amended by section 2 of Act No. 14 of 1914, so as to substitute Attorney-General for Minister as *curator ad litem* of lunatics, a portion of which was confirmed by the *Mental Disorders Act* (No. 38 of 1916),

section 14, when section 2 of Act No. 14 of 1914 was repealed. By the later Act, the Solicitor-General of the Eastern Districts is, in the area in which he exercises his functions, *curator ad litem* of persons detained as mentally disordered under a magistrate's or judge's order.

The powers, duties, and functions of the Attorney-General in relation to criminal prosecutions are fully dealt with in Act No. 31 of 1917 (see particularly Chapter II thereof).

Particulars as to the functions of the Union Department of Justice are given in Chapter II, and particulars as to the cost of the administration are given in Chapter XXII.

The permanent head of the Department is the Secretary for Justice.

2. **Judges and Staff of the Supreme Court.**—The names of the Judges and Registrars of the several divisions of the Supreme Court of the Union are given below :—

SUPERIOR COURTS AND JUDICIARY OF THE UNION.

Supreme Court of South Africa, Appellate Division :—

Chief Justice	The Rt. Hon. Sir J. Rose-Innes, P.C., K.C.M.G.
Judges of Appeal	Sir W. H. Solomon, K.C.S.I., K.C.M.G.; Hon. J. de Villiers; Sir J. G. Kotzé, Kt.; and Sir J. W. Wessels, Kt.

Provincial and Local Divisions :—

Judge-President	(Cape of Good Hope)	Sir M. W. Searle, Kt.*
,,	(Transvaal)	Hon. J. S. Curlewis.
,,	(Natal)	Sir J. C. Dove Wilson, Kt.
,,	(Orange Free State)	Sir J. E. R. de Villiers.
,,	(Eastern Districts)	Sir T. L. Graham, Kt.
Puisne Judge	(Cape of Good Hope)	Hon. F. G. Gardiner.
,,	,,	Hon. L. E. Benjamin.
,,	,,	Hon. H. S. van Zyl.
,,	,,	Hon. E. F. Watermeyer.
,,	,,	Hon. H. M. Louwrens.
,,	,,	Hon. P. S. T. Jones.
,,	(Griqualand West)	Hon. F. A. Hutton.
,,	(Eastern Districts)	Hon. W. Pittman.
,,	,,	Hon. F. J. W. van der Riet.
,,	(Transvaal)	Hon. D. de Waal.
,,	,,	Hon. J. Stratford.
,,	,,	Hon. B. A. Tindall.
,,	,,	Hon. F. E. T. Krause.
,,	,,	Hon. R. Feetham.
,,	,,	Hon. L. Greenberg.
,,	,,	Hon. J. H. F. E. R. C. Gey van Pittius.
,,	(Natal)	Hon. T. F. Carter.
,,	,,	Hon. E. L Matthews.
,,	,,	Hon. F. S. Tatham.
,,	(Orange Free State)	Hon. A. J. McGregor.
,,	,,	Hon. H. F. Blaine.

Native High Court, Natal :—

Judge-President	H. G. Boshoff.
Judge	A. W. Leslie.
,,	F. A. Farrer.
,,	C. F. Hignett.

REGISTRARS OF COURTS.

Appellate Court	M. C. Cloete.
Cape of Good Hope :—	
Cape Town	R. G. Russouw.
Grahamstown (Eastern Districts)	A. M. Black.
Kimberley (Griqualand West)	T. O'Hagan (Assistant Registrar).
Transvaal :—	
Pretoria	I. G. Horak.
Johannesburg (Local Division)	J. C. Hinsbeeck (Assistant Registrar).
Natal	K. W. McAlister.
Orange Free State	W. H. Fitchett.
Native High Court (Natal)	W. H. D. Goss.

* Killed in Salt River Railway Disaster, June, 1926; successor, Mr. Justice Gardiner.

3. **Sheriffs**—(i) *Appointment and Functions.*—In each of the Provinces of the Union there is a Sheriff, who is an officer of the Public Service, and whose duties are to execute, either by himself or by deputies appointed by him and duly authorized under his hand and seal, the sentences, decrees, judgments, writs, summonses, rules, orders, warrants, commands, and processes of any division of the Supreme Court within his Province. The Charter of Justice of the Colony of the Cape of Good Hope sets out in section 27 that "the Sheriff shall by himself or his sufficient deputies, to be by him appointed and duly authorized under his hand and seal, and for whom he shall be responsible during his continuance in such office, execute, and the said Sheriff, by himself and his said deputies, are hereby authorized to execute, all the sentences, decrees, judgments, writs, summonses, rules, orders, warrants, commands, and processes of the said Supreme Court of the Cape of Good Hope, or of the Circuit Courts of the said Colony hereafter mentioned, and shall make a return of the same, together with the manner of the execution thereof, to the Supreme Court of the Cape of Good Hope, or to the said Circuit Courts, as the case may be, and shall receive and detain in prison all such persons as shall be committed to the custody of such Sheriff by the Supreme Court of the Cape of Good Hope, or by the said Circuit Courts or by the Chief Justice, or by any other Judge of the said Courts."

This provision was closely followed in the other Provinces (see in Natal 66 of the *Supreme Court Act*, No. 39 of 1896, in the Transvaal 4 of Proclamation No. 17 of 1902, and in the Orange Free State 3 of Ordinance No. 9 of 1902).

(ii) *Laws Defining Powers and Duties.*—The powers and duties of the Sheriff are set out in the rules of the various divisions of the Supreme Court and in the Cape Province, in Ordinance No. 37 of 1828, in the Transvaal in Ordinance No. 9 of 1902, and the Orange Free State in Proclamation No. 17 of 1902. In criminal matters the powers of the Sheriffs throughout the Union are also dealt with in the *Criminal Procedure and Evidence Act*, No. 31 of 1917.

(iii) *Special Powers and Duties in Criminal Matters.*—Section 341 of the Criminal Procedure and Evidence Act, No. 31 of 1917, enacts that as soon as it is practicable after a sentence of death is passed, the Judge who passed the sentence or any other Judge of the Court shall issue his warrant to the Sheriff or his deputy for the execution of the sentence, but that the warrant shall not be executed until the Minister of Justice has, in writing signed by himself, given notice to the Sheriff or his deputy that the Governor-General has decided not to exercise in the case the Royal prerogative of mercy. As soon after the receipt of such notice by the Sheriff or his deputy as fitting arrangements for the execution of the sentence can be made, the warrant must be executed by the Sheriff or his deputy.

The process of the Court for summoning an accused person to answer any indictment or to subpoena witnesses is by writ or warrant directed to the Sheriff or his deputy in the prescribed form (see paragraph 3 of the Fifth Schedule and form 16 of the Fifth Schedule to Act No. 31, 1917).

The Sheriff receives the jury lists in criminal cases and keeps the jurors' book. He, or his deputy, in manner provided in section 186 of Act No. 31 of 1917, draws the names of the jurors to be summoned for the criminal sessions, and summonses the persons whose names are so drawn (see Chapter XI of Act No. 31 of 1917).

§ 7. Statistics of Crime.

1. **General.**—The new system of collecting criminal statistics which was inaugurated on 1st January, 1921, has proved a complete success, and statistics relating to persons brought to trial in the Union and South-West Africa are furnished by the Statistics Office to the Commissioner of Police for administrative purposes within fifteen days of the close of each month, and a consolidated annual return is available within one month of the close of the year. The figures are also included in the publications of the Statistics Office.

The system involves the completion of a form setting forth the race, sex, age, nationality, birthplace, occupation, offence and result of trial of every person arrested, summoned or warned.

Owing to financial stringency the Government decided to discontinue the collection of Penological Statistics. Figures relating to crime as affected by environment, antecedents, drink, etc., are, therefore, not available; but from other sources it has been found possible to differentiate between serious crime committed in industrial and rural areas. For the same reason the collection of data respecting civil actions has also been suspended, as stated in § 3, paragraph 4 above.

It will be observed from the table below that no full particulars of crime are available before 1913, when the *Police Act* (Act No. 14 of 1912) came into operation. Prior to this date the Union was policed by a number of forces under separate control, and it was found impracticable to consolidate the figures of the different systems then in use. In 1913 the system of collecting criminal statistics then in use in the Transvaal Province was adopted throughout the Union.

The following tables (i) and (iii) show the total number of prosecutions, convictions, etc., for all offences during a series of years. Particulars of serious crimes in the Union are given in the following paragraph. Throughout this section, in the figures for persons charged in respect of the year 1921 and subsequent years, *no account is taken of persons awaiting trial.*

(i) NUMBER OF PERSONS CHARGED BEFORE COURTS, 1912* TO 1924.

Year.	Cape of Good Hope.	Natal.	Transvaal.	Orange Free State.	Union.	Per 1,000 of Population.
1912	†	†	†	†	280,115	46
1913	82,140	59,748	113,402	23,984	279,274	45
1914	84,438	57,817	106,824	21,918	270,997	42
1915	83,254	55,267	121,712	23,287	283,520	44
1916	85,866	60,833	131,767	26,328	304,794	47

2. **Serious Crime.**—A large proportion of the persons brought before the courts of the Union each year are charged with petty offences, chiefly contravention of statutes, common assault and common theft. For the most part the option of a fine is given in such cases. On the other hand, an appreciable percentage of the total charges before the courts relates to what may be properly designated as serious crime. Statistics of such cases are contained in the tables hereunder, which show the results of serious criminal charges during a period of years, details of such charges for two years, and particulars of murder cases, stock thefts and offences under the liquor laws during a period of years.

It will be observed that the totals for the years 1923 and 1924 are considerably smaller than those for the two preceding years. This is not because of a decrease in the incidence of serious crime in the Union, but because certain items, not included in the category of serious crime prior to 1923, were added in that year and in 1924, and because certain others previously taken account of were excluded. The offences added were bigamy, contraventions of the diamond laws, buying, selling, and possession of gold, offences against the immorality laws, Europeans selling liquor to natives, public violence, and receiving stolen property. Prior to the year 1923 all cases of common theft were statistically included under serious crime. In that year it was decided that henceforth common theft cases were only regarded as serious crime where the value of the goods stolen was estimated to be in excess of £50.

3. **Analysis of Statistics of Crime, 1924.**—(i) *Persons Arrested, Summoned or Warned.*—The number of persons arrested, summoned or warned during 1923 and 1924 was as follows :—

1923..... 390,086 ; percentage of population..... 5·44
1924..... 420,170 ; percentage of population..... 5·76.

The *race and sex* of the persons concerned in 1924 were as follows :—

Race.	Male.	Female.	Total.	Per 1,000 of Population.	
				Male.	Female.
European.....	53,816	2,718	56,534	65·37	3·45
Other.....	320,253	43,383	363,636	110·55	15·57

The *predominant offences* in the Union in 1924 were as follows : Municipal offences 47,575 ; Native Pass Law, 46,100 ; Hut and Poll Tax, 32,598 ; common assault, 26,664 ; common theft, 20,990 ; Masters and Servants Act, 19,327 : drunkenness, 26,358 ; possession of kaffir beer, 23,719 ; diseases of stock, 14,145.

Amongst Europeans the predominant offences were : Municipal offences, 12,075 ; drunkenness, 4,849 ; Motor Ordinances, 6,530 ; common assault, 3,692 ; poll tax, 2,852 ; stock diseases, 2,336 ; Police offences, 1,626 ; common theft, 1,644.

(ii) *Serious Crime.*—Serious offences were alleged against 31,203 persons representing 7·43 per cent. of the persons brought before the Courts. Of these 3,609 were Europeans, 22,328 natives, 618 Asiatics, and 4,648 other non-European persons. The number of Europeans tried for serious offences was equivalent to 6·38 per cent. of all persons of that race brought before the courts. The corresponding percentages in the case of the other races were : Natives, 7·20 ; Asiatics, 5·94 ; and other non-European persons, 10·76.

(iii) *Disposal of Cases.*—The percentage of convictions, acquittals, etc., to the total number of persons brought before the Courts in 1924 was :—

Heading.	Convicted or Bail Estreated.	Discharged.	Escaped.	Insane.	Died.	Case Withdrawn.
	%	%	%	%	%	%
All cases.....	87·95	7·61	0·01	0·05	0·02	4·36
Serious crime....	74·37	19·73	0·05	0·22	0·10	5·53

(iv) *Convictions for Serious Crime.*—The following table shows the convictions for various classes of serious offences during 1923 and 1924, according to race of the persons convicted :—

(v) *Stock Thefts.*—The convictions for stock theft amounted to 25 per cent. of the total convictions for serious crime. The thefts of small stock (sheep, goats, pigs, poultry, and domesticated game) accounted for 86 per cent. of the total convictions for this class of offence. Of the persons convicted for stock theft, 3 per cent. were Europeans.

(vi) *Liquor Law.*—The convictions for offences under this head (53,860) amounted to 14 per cent. of the total convictions. The various offences under liquor laws were distributed in the following percentage proportions of the total convictions under that head :—

Offence.	European.	Non-European
	%	%
Drunkenness	8·79	39·39
Possession of kaffir beer	—	41·68
Possession of other liquor	—	6·36
Europeans selling to natives	1·18	—
Coloured selling to coloured	—	1·42
Other offences (Liquor Laws)	0·34	0·84

(vii) *Immorality Laws.*—The convictions for offences under these laws (405) represented 0·11 per cent. of the total. The convictions were under the following heads :—

Offence.	European.	Non-European.
Keeping a brothel	11	27
Living on proceeds	4	7
Procuring	—	4
Soliciting	60	236
Other offences	15	41

(viii) *Nationality and Birthplaces of Europeans Charged.*—90 per cent. of Europeans charged with various offences in 1924 were British born, 4 per cent. were naturalized British subjects, 3 per cent. were Russians, and 0·3 per cent. Germans. Of the total number of Europeans charged, 32 per cent. were born in the Cape, 8 per cent. in Natal, 25 per cent. in Transvaal, 8 per cent. in the Orange Free State, 15 per cent. in the British Isles, and 6 per cent. in Russia.

(ix) *Occupations of Offenders (Europeans).*—The occupations of offenders in 1924 are shown hereunder :—

Occupation—	Per cent.
Professional	4·7
Domestic	4·5
Commercial	23·0
Transport and communication	8·9
Industry	12·6
Primary producers, agriculture	22·3
Primary producers, mining	7·1
Independent	0·3
Dependent	—
Unspecified	16·6

(x) *Juvenile Crime.*—European juveniles, aged 16 years and under, were prosecuted for 76 different kinds of offence during the year, to the number of 1,376. The following were the predominant offences involved :—

Nature of Offence—	Per cent.
Municipal offences	23·0
Theft (common)	22·4
Assault (common)	5·9
Housebreaking by night	4·5
Housebreaking by day	5·7
Police offences	5·2
Railway and Harbours Act	3·1
Malicious injury to property	4·6
Motor Ordinances	2·2
Theft, bicycle	1·7
Cruelty to animals	1·5

Small numbers were charged with serious offences, as follows :—Murder, 1 ; indecent assault, 1 ; bestiality, 1 ; forgery, 4 ; bicycle theft, 23 ; theft by conversion, 3 ; theft by fraud, 6 ; stock theft, 12 ; selling liquor, 5.

The percentage of juveniles convicted (including bail estreated cases) was 77, and discharged 13. 10 per cent. of the cases were withdrawn. The sentences imposed are shown by the following percentages of the total convictions :—Imprisonment with option of a fine, 9 ; cautioned or reprimanded and discharged, 26 ; corporal punishment, 21 ; sent to reformatory or industrial school, 4; fined only, 12 ; other order of court, 3 ; suspended sentences, 2.

(xi) *Suspended Sentences (European).*—The number of suspended sentences imposed during the year 1924 was as follows :—

Up to and including 6 months.....	1,369
Over 6 months and up to and including 12 months.....	11
Over 12 months.....	1

§ 8. Prisons.

1. **Prison System.**—The guiding principles of the Union penal system are to rescue the child from criminal environment and prevent it from becoming a criminal ; to build up and supplement in the criminal the elements necessary to prevent a recurrence of crime ; and, if all else fails, by means of the indeterminate sentence to remove the habitual criminal from society and prevent his remaining a menace to it ; but even then to allow him an opportunity of self-redemption. It seeks to attain these objects through the instrumentality of Government industrial schools for waif and stray children, of reformatories for children who have committed crime, and of various penal institutions for adults and by classification and division within such institutions. The factors making for reformation operating in the prison are religious and moral influences, schooling, drill and discipline, the training of the hand and the eye, and sound literature. A simple system of marks records the progress or retrogression of the prisoner. The Prison Visitors' Boards, on which the judicial, the medical, and the prison administrations are represented in addition to the body of citizens, determine the period when the prisoner may with safety be allowed back into the ranks of society by keeping in constant touch with him personally and by following his conduct reports. They commend him when he improves and exhort him when he lapses. The South African Prisoners' Aid Association [see Chapter VIII] also keeps in touch particularly with the European prisoner, preserves the bond with his family, prepares the way for his return to society and stands by him in the difficult days after his discharge from prison when after long restraint he regains his liberty. To make the release not too sudden the Prison Farm has been introduced, where gradually the prisoner gets back to the conditions of outside life. Among preventive influences there is the suspended sentence, and there is also the Probation Officer, who stands by the sentenced man and helps him to redeem the promises made by him to the Courts. Again as regards the native the Road Camp has been created, so that for venal offences against the Pass Law, the Tax Law, or the Masters and Servants Law he goes direct from Court to camp and never actually enters a gaol. Gradually the features and methods of penal systems of the past are being abandoned. Single cells are coming more and more to the fore. The detention of Europeans and natives in the same wards is now forbidden. The guarding of European prisoners by coloured warders has been discontinued. The indiscriminate locking up of witnesses for months in gaol lest they might disappear is no longer resorted to. The practice of restraining lunatics in prison has been resolutely discountenanced, and under Section 14 of the *Prisons Act* lunatics now go to proper hospitals, while the pauper sick are dealt with similarly. The treadmills and stocks of the old system have become a thing of the past. Night schools for adults, popular science books in place of unedifying literature, and an occasional lecture on an elevating subject have now found a permanent place in the prison system.

2. **Prison Labour.**—Profitless labour such as oakum picking is now unknown, and its place has been taken by creative arts and trades. At the prisons excellent mats are now made from the discarded sheath leaf of the mealiecob, replacing the coir mats imported from India. Manilla rope of sisal fibre grown on the prison farms has been turned out by the thousand yards. Prison building on a large scale is undertaken. Blankets are woven from South African wool. Buttons are turned by machinery out of discarded bone and the remnants ground into bone dust fertilizer by the prisoners. Baskets and basket chairs are made from prison-grown osier and rush. Uniforms and boots are made in large quantities, and all brushes and brooms required by Government departments in the Union are produced by the prisoners, including the carpet broom made from broom corn grown on the prison farms. Prison labour also is responsible for furniture of South African hardwood for Government offices, and for polished desks for the reformatory schools.

3. **Penal Legislation.**—These measures have been made possible by the *Prisons Act*, No. 13 of 1911, which incorporated the chief features of the Transvaal laws and especially of Act No. 38 of 1909, which was the first legislation to break ground on modern penological lines. With the *Prisons Act* must be read the *Indeterminate Sentence Law*—Act No. 9 of 1911, the Act to keep people out of the gaol, Law No. 40 of 1914, and the *Children's Protection Act*, No. 25 of 1913 (the administration of which has now been passed to the Union Education Department). Act No. 46 of 1920 gives Government recognition and assistance to certified hostels for the reception of lads who would otherwise be committed to penal institutions.

Prominent provisions of the Act designed to keep people out of gaol are that no one may be sentenced to less than four days' imprisonment, and no witness may be detained in gaol except on the express application of the Attorney-General. For a trifling offence the accused can deposit the maximum fine with the police, from which, if he is found guilty, his fine is deducted, any balance of his deposit being refunded. In a serious matter the Court may, if it finds him guilty, reprimand him or postpone the passing of sentence, suspend the operation of the sentence, obtain the fine out of the offender's wages, allow him to pay by instalments, or permit him to give sureties.

4. **Training and Instruction.**—In prison life the position of a warder is an important one, and a warders' training school has been established at the Central Prison at which the main principles of the proper treatment of prisoners are taught.

Instruction is given in matters of drill and discipline, and there is a thorough grounding in prison practice and regulations. The Prison Medical Officer deals with self-aid in accidents and with thrift, and an advocate of the Supreme Court teaches the elementary doctrines of criminal and penal law.

5. **The Indeterminate Sentence: Nature and Working.**—The *Transvaal Criminal Law Amendment Act* No. 38 of 1909, which came into force on the 1st of October of that year, first empowered Superior Courts to declare as *habitual criminals* all those who might be three times convicted of certain scheduled offences. Such convicted persons were to be detained at hard labour during the Governor's pleasure and were not to be released until the Board of Visitors, whose creation was also provided for in the Act, should have reported to the Governor: (*a*) that there was a reasonable probability that the habitual criminal would in future abstain from crime and lead a useful and industrious life; or (*b*) that he was no longer capable of engaging in crime; or (*c*) that for any other reason it was desirable to release him. Upon receipt of such a report the Governor was empowered to order the release of the habitual criminal unconditionally or on probation on such conditions as to supervision or otherwise as might be determined. A person who failed to observe any condition of release could be re-arrested and re-committed to prison and detained there as though he had not been released. If the person released on probation completed the period without breaking any condition of his release he would no longer be deemed to be an habitual criminal; but there was nothing to prevent his being again declared an habitual criminal if he appeared before a Superior Court for a further crime.

The provisions of this law were extended to the Union by Act No. 9 of 1911, in force from 28th April, 1911, and by the *Prisons Act*, No. 13 of 1911, in force from 1st October, 1911. The provisions of Act No. 9 of 1911 were re-enacted by Section 344 of the *Criminal Procedure and Evidence Act*, No. 31 of 1917.

The scheduled offences whereof a third conviction renders the offender liable to be declared an habitual criminal, include the following:—(i) Rape or any statutory offence of a sexual nature against a girl of or under a prescribed age; (ii) robbery; (iii) assault with intent to commit murder, rape or robbery, or to do grievous bodily harm or indecent assault; (iv) arson; (v) fraud; (vi) forgery or uttering; (vii) offences relating to the coinage; (viii) breaking into or entering premises with intent to commit an offence; (ix) theft; (x) receiving stolen property; (xi) extortion or threats by letter or otherwise with intent to extort; (xii) offences described in any law for the suppression of brothels and the punishment of immorality; (xiii) illicit dealing in or possession of precious metals or precious stones; (xiv) illicit liquor supplying to natives or coloured persons; (xv) any conspiracy, incitement or attempt to commit any of the above-mentioned offences.

Each habitual criminal has a personal interview with the Board once a year when he has an opportunity of making any representations he wishes and the Board is enabled to question him and observe his demeanour. Each habitual criminal is also seen once a year by the Director of Prisons. On a consideration of the various factors the Board can decide whether the time is ripe for recommending that the convict be given a chance to prove whether he can be safely trusted again amongst his fellowmen. The Board ascertains in what locality the convict is most likely to make good and on release he is transported to that locality and reports to the local Probation Officer who renders such assistance as may be necessary in placing him in steady employment. Before release is actually effected the convict has been tried for a period in prison under conditions approximating to freedom. It is found that some men break down even under this relaxation and prove their unfitness for final release.

The first indeterminate sentences were passed in 1910, when 2 European males and 27 native males were declared habitual criminals. In 1920 the record number of such sentences was passed, 20 Europeans, 154 native males and 1 native female being declared habitual criminals.

The number of indeterminate sentences passed up to the end of 1924 was: European males, 127; native and coloured males, 1,338; native and coloured females, 14; Asiatic males, 16; a total of 1,495. Up to the end of that year no European or Asiatic females had received the indeterminate sentence. As no European male sentenced later than 1922 had been released up to the end of 1924, it is necessary, in order to see what results have been achieved, to deduct from the total the number sentenced during that period. One hundred and one European males were declared habitual criminals between 1910 and 1922, of whom 4 died and 3 were removed to a mental hospital, leaving 94 cases to be considered. Of these, 46 have been released on probation and 1 was unconditionally released on medical grounds. Five of the 46 relapsed and were returned to prison during the probationary period, and 1 released in 1915 was redeclared an habitual criminal in 1919. The failures, therefore, were 6 out of 46, or say 13 per cent. Three men released were deported and it is possible that some others have left the country. One man sentenced in 1910 and released in 1913 on two years' probation relapsed after seven months of liberty. After serving a further seven years, he was given another chance, being released in 1922 on four years' probation. After nine months he had to be returned to prison for a breach of his probationary conditions. This is the only European who has been twice released.

No native or coloured female sentenced later than 1919 has been released. Of the 5 sentenced between 1911 and 1919, 1 died and 3 were released on probation, 1 in 1916, 1 in 1921, and 1 in 1924. None of these has relapsed.

The results in regard to Asiatic males have been most disappointing. Of the 16 sentenced during 1911 to 1924, 1 died, 9 were released, viz., 7 on probation and 2 for deportation, and 3 were removed to a mental hospital. The seven who were released on probation in 1918 all relapsed; two within 7 months, and the other five in 7½, 14, 18, 18, and 20 months respectively. Four of these were released again in 1922 and deported. The two who were unconditionally released for deportation in 1922 and 1923 respectively had been sentenced in 1916 and 1919.

No native or coloured male sentenced since 1919 had been released up to the end of December, 1924. Of the 684 sentenced from 1910 to 1919, 84 died in custody, 31 were transferred to mental hospitals, 1 was removed to a leper institution, and 2 were removed from the class, leaving 566 cases for consideration. Of these 566 cases, 269, or 47 per cent., have been released on probation, 71 have relapsed during their probationary periods, and 19 have been redeclared habitual criminals after safely passing through their probation. The failures, therefore, amount to 90 out of 269 cases, or 33 per cent.

Two men sentenced in 1910 and released in 1914, after nearly four years relapsed and returned to prison. After over seven years' further detention, these two men were released again in 1921, and one of them relapsed again after nine months' freedom. The second man is still at liberty.

6. **Statistics.**—The subjoined tables give statistics in regard to penal establishments in the Union, sentenced offenders, juvenile offenders, paupers, mental defectives, and debtors admitted to prisons or held in custody for a period of years, and an analysis of convictions obtained in 1924. Particulars for earlier years and for intermediate years, where averages only are given, will be found in the sixth and previous issues of this *Year Book*. The concluding table shows the average number of hard labour units employed daily during the year 1924:—

(i) PENAL ESTABLISHMENTS, FROM 1921.

Year.	Convict Prisons.	Gaols.	Reformatories.	Road Camps.	Farm Colonies and Inebriate Reformatories.	Labour Out-stations.	Prison Farms.	Total.
1921.....	9	183	7	3	2	8	2	214
1922.....	9	184	8	3	2	4	1	211
1923.....	11	177	7	3	2	6	2	208
1924.....	10*	177	7	3	3	5	2	207

* Including one hospital prison in the Cape.

(ii) SENTENCED OFFENDERS ADMITTED TO PRISONS,* FROM 1912.

YEAR.	European.		Other.		All Sentenced Prisoners.

(xi) AVERAGE NUMBER OF PRISONS HARD LABOUR UNITS EMPLOYED DAILY, 1924.

Heading.	Daily Average.	Heading.	Daily Average.
	No.		No.
Employed for Prisons Department	4,779	Employed for others—	
Employed for Government Departments—		Gratis.....	537
Gratis.....	1,547	For remuneration.....	3,035
For remuneration.....	1,788	*Not employed (ineffective).....	4,282

* Owing to sickness, rain, Sundays, Public Holidays, etc.

NOTE.—The amount earned by prisons hard labour units during the year was £126,172.

7. **Administration of Prisons.**—The administration of the prisons of the Union is placed under the Director of Prisons in the Department of Justice. Particulars as to the cost of administration are contained in Chapter XXII.

§ 9. Miscellaneous.

1. **Trial of Children and Juveniles.**—A child under sixteen charged with an offence cannot without the authority of the Minister of Education be detained in any prison, gaol, or lock-up while awaiting trial unless there is no other accommodation available; such child, if its detention is necessary, must be kept in a place specially approved and detained by a temporary custodian approved by a magistrate. A policeman above the rank of sergeant may, unless the offence charged is a serious one, release the child from custody on bail. These provisions also apply to convicted children awaiting admission to reformatories and certified hostels and awaiting apprenticeship.

When any person who is apparently under twenty-one years of age is charged with an offence, any judge or magistrate on application to him *in camera* may order such person while awaiting trial, verdict, or sentence to be detained in a certified hostel instead of in prison.

Section 5 of the *Magistrates' Courts Act* (No. 32 of 1917) enacts that the trial of any child who is, in the opinion of the court, less than sixteen years of age, may be held *in camera* in some place other than an ordinary court room. In such cases the parent or guardian of the child has the right to be present, but no person (other than the members and officers of the court and other persons directly concerned) may be present except by leave of the court.

In some of the larger urban centres the same magistrate deals with all cases against children.

The *Childrens' Protection Act* (No. 25 of 1913) provides that in addition and without prejudice to the court's power to hear proceedings *in camera*, the court may, if a child is called as a *witness* in any criminal case or in proceedings under that Act, direct that all or any persons, except those directly concerned in the case be excluded from the court during the taking of the evidence of the child.

2. **Punishments for Juvenile Crime.**—(i) *General.*—A child of an age when in law it can commit a criminal offence can be sentenced to imprisonment or detention in a reformatory or certified hostel, or fine, or whipping. In view, however, of the provision which has been made for the detention of children in reformatories and certified hostels, it is rarely necessary to sentence a child to detention in a prison. In the case of a child convicted of murder a Superior Court may refuse to pass sentence of death and pass some other sentence.

(ii) *Reformatories.*—The Government is authorized to establish reformatories (which include training ships) for the custody of juvenile offenders and juvenile adults. A *juvenile* is generally speaking a person under sixteen years of age and, if the Minister approves, a person under eighteen years who has been sentenced to imprisonment. A *juvenile-adult* is a person who is between the ages of sixteen and twenty-one and may include a person between twenty-one and twenty-five. The head of a reformatory is called a warden. He possesses the powers of a parent for disciplinary purposes.

Any superior or magistrate's court may order the detention in a reformatory of a juvenile or juvenile-adult in lieu of detention in prison.

Juveniles may be detained for not less than two and not more than five years. The period of such juvenile's detention must, however, expire when he reaches the age of eighteen years. The court is further empowered to order that at the expiry of the sentence of detention in a reformatory the juvenile be apprenticed until he attains the age of eighteen, and the magistrate of any district in which a reformatory is situated may apprentice a juvenile detained in that reformatory until he reaches the age of eighteen. Apprentices who abscond or misbehave may be returned to a reformatory.

Juvenile-adults may be detained in a juvenile-adult reformatory for a period of not less than two and not more than five years.

The Minister of Justice may order the removal to a juvenile reformatory of any child of sixteen who is undergoing imprisonment in a gaol or may order such child to be apprenticed until he is eighteen or until his sentence expires. Juveniles may be punished for offences committed whilst detained in a reformatory.

(iii) *Certified Hostels.*—In addition to prisons and reformatories, there is another class of institution, viz., the certified hostel for the detention of juveniles. These are semi-private institutions licensed by the Minister of Justice as places to which young persons under twenty-one years of age convicted of any offence except murder, may be committed for not less than two or more than five years. A court may pass sentence of *imprisonment*, but order the operation of the sentence to be suspended for not less than two or more than five years on condition that the offender lives in a certified hostel and is of good conduct. The management of a certified hostel may refuse to accept persons committed to it. Juveniles or juvenile-adults may be discharged from a reformatory on condition that they reside in a certified hostel and are of good conduct. Children may, under certain circumstances, be transferred from industrial schools to certified hostels. Persons considered unsuitable for detention in a certified hostel may be removed to a reformatory.

A court may order the parent, step-parent, or guardian of a child committed to a hostel to contribute towards such child's maintenance therein.

(iv) *Whipping.*—Male children under sixteen years of age may be sentenced to whipping. Such sentence must, however, be a substitute for any other punishment. It must be inflicted in private and must not exceed fifteen cuts, which are inflicted in such place and with such instrument as the court appoints. The parent or guardian has the right to be present. Male children over sixteen years of age may be sentenced to receive not more than fifteen cuts in addition to, or in substitution for, any punishment to which the offender is otherwise liable. The whipping of females is prohibited.

3. **Suspended Sentences.**—(i) *Minor Offences.*—If any person is convicted of :—

(*a*) contravening a statutory by-law made by a local authority or a statute or statutory regulation; or

(*b*) any other offence in respect of which the court would not have imposed a fine exceeding £5, or in default of payment, sentenced the offender to imprisonment for a period exceeding one month—

the court may, subject to such conditions as it may impose :—

(*a*) postpone for a period not exceeding one month the passing of sentence and release the offender under recognizances to appear at the end of that period;

(*b*) pass sentence, but order the operation thereof to be suspended for a period not exceeding one month on conditions;

(*c*) order payment of the fine, but suspend the enforcement thereof if the offender enters into recognizances to pay within one month either in one sum or in instalments.

If the conditions of any order made or recognizances entered into are not fulfilled, the offender may be arrested without warrant and committed to prison to serve any alternative sentence of imprisonment.

(ii) *Serious Offences.*—If any person is convicted of :—

Any offence (except public violence, murder, culpable homicide, rape, assault with intent, indecent assault, robbery, forgery and uttering, fraudulent insolvency, offences relating to coinage, any offence in respect of which a minimum punishment is by law imposed and any conspiracy, incitement or attempt to commit any of the above offences) and no previous conviction for any offence whatever—other than the contravention of a statutory by-law made by a local authority or a statute or statutory regulation, in respect of which the maximum fine is £5 or in default of payment of the fine, imprisonment—is alleged or proved against the offender—

the court may, subject to such conditions as it may impose :—

(*a*) postpone for a period not exceeding six months the passing of sentence and release the offender on recognizances to appear at the expiration of that period ;

(*b*) pass sentence, but order the operation thereof to be suspended for a period not exceeding three years ;

(*c*) pass sentence, of a fine or in default of payment, imprisonment, but suspend the issue of a warrant of committal in default of payment for not more than twelve months in order to give the offender an opportunity of paying the fine either in one sum or in instalments.

If at the end of period for which sentence has been postponed under (*a*) the offender has complied with the conditions the Court may discharge him without passing sentence.

If during the period of suspension the offender has observed the conditions under (*b*) the sentence is not enforced.

If the conditions of suspension or postponement are not fulfilled the offender may be arrested and made to undergo the sentence which has been or may be imposed.

4. **Probation Officers.**—Whenever a court considers that the care or supervision of a probation officer may benefit an offender (or his dependents) whose sentence has been postponed or suspended, the Court may entrust the offender to the care of such probation officer during the period the sentence is postponed or suspended.

An offender placed under the care of a probation officer must observe the conditions imposed, which usually include, *inter alia*, periodical reports to probation officer ; residence within certain fixed limits ; notification of change of address ; not entering bars, etc., and abstaining from liquor ; not associating with persons of bad character ; good conduct and honest work ; submission to advice and guidance of probation officer.

On report of the probation officer the court may relax or vary any conditions imposed.

Probation officers are under the instructions of the Minister of Justice and the court of the area for which they are appointed. *Inter alia*, their duties are :—

(*a*) To visit, watch over and act as the best friend of the persons entrusted to their care and to see that such persons comply with the conditions imposed by the Court ;

(*b*) to investigate breaches of conditions and to furnish reports thereon to the courts etc., concerned ;

(*c*) where an order to that effect has been made, or where the offender has agreed thereto, to receive the latter's wages and utilize the same for the benefit of the offender or his family.

Full-time probation officers have been appointed in Johannesburg, Cape Town, and Pretoria and a part-time officer at Durban. The Minister may appoint officers of the Prisoner's Aid Association or Children's Aid Society as probation officers. At centres where no such officers have been appointed the services of members of the Police Force or officials of the Native Affairs Department may be utilized as probation officers.

CHAPTER X.

POLICE AND PROTECTION.

§ 1. Development of the Union Police Organization.

1. **Organization of the Police Force before 1910.**—Earlier issues of this *Year Book* contained an historical account of the development of the South African Police Forces up to the date of the constitution of the Union, and also statistics showing the strength of the various units at that date. These have not been repeated owing to exigencies of space.

2. **Organization of the Police Force after 1910.**—On the amalgamation of the Police Forces of the Union and the formation of the Permanent Force (South African Mounted Rifles) on 1st April, 1913, the latter force was made responsible for the policing of the Northern Transvaal, the Natal Province (with the exception of the Durban Water Police patrol area), the districts in the Orange Free State on the Basutoland border, the Transkeian native territories with the districts of King William's Town, Komgha, Aliwal North, Barkly East, and Herschel, and the north-western portion of the Cape Province; the remainder of the Union being administered by the South African Police. When War broke out in August, 1914, the South African Mounted Rifles were mobilized for active service, and the policing of the areas assigned to that force devolved on the South African Police, by whom it was continued until peace was proclaimed. The South African Mounted Rifles then took over their normal work and districts, with the exception of those in the Northern Transvaal, Orange Free State, and the Transkei, including King William's Town, Komgha, Aliwal North, Barkly East, and Herschel, which remained under South African Police administration. The fact that during peace time the work performed by both Forces is identical, led the Government to determine that from the point of view of both economy and efficiency, it would be better to convert the two Forces into one Police Force and thus do away with dual administration. This, it was considered, would result in more uniform organization. Accordingly, on 1st April, 1920, the Permanent Force (South African Mounted Rifles) was absorbed and attached to the South African Police, who again assumed responsibility for the policing of the whole of the Union. In order that adequate police protection should be afforded to the areas formerly patrolled by the South African Mounted Rifles, as many members of that Force as possible were accepted for service in the South African Police, and twenty-six officers, 196 non-commissioned officers, 1,022 constables, and 2,287 native police have been so absorbed.

3. **Number of Police in Provinces and Divisions.**—The allocation of police to the various Provinces is indicated in the subjoined table (i), and in table (ii) is given an analysis of the European section of the South African Police Force on the 31st December, 1924; Table (iii) shows the strength of the South African Police Force on the 31st December in each year after 1911:—

(i) **SOUTH AFRICAN POLICE—STRENGTH ON 31st DECEMBER, 1924.**

Province.	European.	Non-European.	Total.
Cape of Good Hope	2,710	977	3,687

GRAND TOTAL	156	92	781	4,806	580	6,415

(iii) SOUTH AFRICAN POLICE—TOTAL STRENGTH ON 31st DECEMBER, 1911 TO 1924.

Year.	European.	Native, Coloured, and Indian.	Total.	Year.	European.	Native, Coloured, and Indian.	Total.
1911	5,507	2,871	8,378	1918	5,284	2,298	7,582
1912	5,617	2,807	8,424	1919	5,112	2,417	7,529
1913*	4,473	1,465	5,938	1920	6,352	3,678	10,030†
1914	4,776	1,329	6,105	1921	6,338	3,791	10,129†
1915	4,998	1,573	6,571	1922	6,201	3,743	9,944
1916	5,328	2,244	7,572	1923	6,220	3,845	10,065
1917	5,543	2,359	7,902	1924	6,415	3,879	10,294

* A portion of the Union was allotted to the South African Mounted Riflemen for policing as from 1st March, 1913.
† Including South African Mounted Riflemen.

4. **Duties of the Police.**—In addition to the duties ordinarily appertaining to a police force, the South African Police are constantly required to undertake inquiries on behalf of various Government Departments, including inquiries in respect of missing persons, the naturalization of aliens, and prohibited immigration. Its members undertake criminal prosecutions (as public prosecutors) in almost all of the rural areas of the Union. They act as messengers of the court, excise officers, immigration officers, gaolers and lock-up keepers, revenue officers, polling officers, assist in the compilation of voters' rolls, the registration of births and deaths, serve as lay (health) inspectors, inspectors of vehicles, inspectors of licences, assizers of weights and measures, post agents, pass issuers, hut and other tax collectors, health officers, compilers of jury lists, escorts for lunatics, lepers, etc., meteorological observers, enumerators of statistics, and perform various other duties which are extraneous to police duty proper.

The following table, showing numerically for a series of years the cases in which the intervention of the police was called for, indicates to some extent the variety of the work performed by the Force :—

Description of Circumstances Calling for Police Intervention.	Number of Cases.			
	1921.	1922.	1923.	1924.
Cases reported to the police	367,477	378,860	428,403	459,585
Persons arrested	335,301	346,268	390,086	420,170
Persons convicted	249,260	300,129	340,572	369,535
Persons deported to other countries	80	78	32	67
Persons extradited from other countries	14	7	19	20
Miscellaneous inquiries made, not involving the arrest of persons	121,186	118,630	138,663	138,592
Persons reported missing	2,727	1,453	2,602	2,821
Persons found by the police	1,754	1,007	1,422	2,124
Deaths in which police inquiries were made	3,786	3,384	3,732	3,471
Suicides	293	263	350	366
Fires at which police rendered assistance	647	688	790	625
Persons found on arrest, by fingerprints, etc., to be old offenders	24,836	20,069	26,857	26,447
Escapes from police custody	721	507	743	731
Street accidents in which persons were injured	3,267	3,018	2,590	3,037
Persons taken to hospital by police	1,792	1,515	2,074	2,062
Doors and windows found open by police	4,206	3,848	4,945	5,015

5. **Recruiting and Losses.**—The subjoined table gives particulars as to recruiting for the police force and as to losses from the force :—

RECRUITING AND LOSSES OF POLICE FORCE FROM 1913-14 (EUROPEANS).

Financial Year.	Recruiting.	Losses.	Financial Year.	Recruiting.	Losses.
1913-14	801	461	1919-20	421	386
1914-15	650	504	1920-21	604	473
1915-16	834	796*	1921-22	289	500
1916-17	640	360	1922-23	563	522
1917-18	492	397	1923-24	645	469
1918-19	353	576	TOTAL	6,292	5,444

* The larger number during this year was due to members taking their discharge either by purchase or as time-expired in order to proceed on active service : 183 officers, non-commissioned officers, and men actually left in this manner.

6. **Scales of Pay.**—The following table gives details of the scales of pay and allowances in operation in the South African Police Forces :—

SCALES OF PAY AND ALLOWANCES—SOUTH AFRICAN POLICE FORCE.

Rank.	Pay and Allowances.*	Rank.	Pay and Allowances.*
Commissioned Officers.			
Commissioner	£1,500–£1,700	Constables, 2nd Class	£140–£210
Deputy-Commissioner (hdqrs.)	£900–£1,100	Recruits on Enrolment †	£120
Deputy-Commissioners	£800–£950		
Divisional and Senior Inspectors*	£650–£750	*Detective Branch.*	
Inspectors*	£500–£600	Detective Head Constable	£380–£440
Sub-Inspectors*	£420–£480	Detective Sergeant, 1st Class	£340–£390
		Detective Sergeant, 2nd Class	£280–£340
Other Ranks.		Detective Constables	£170–£302
Head Constables	£340–£400		
1st Class Sergeants	£300–£350	*Indian, Coloured and Natives.*	
2nd Class Sergeants	£260–£305	Sergeants	£95–£105
Constables, 1st Class	£150–£282	Corporals	£78– £90
		Constables‡	£48– £66

* Long service increments are payable after a certain number of years' service : Inspectors, £50 per annum ; sub-inspectors, £30 per annum.

† Free quarters, but without allowances whilst undergoing training at a police depot.

‡ Indian, coloured, and native constable labourers at rates not exceeding those for Indian, coloured and native constables.

§ 2. Defence System of the Union.

1. **General.**—Since its inception the Union Government has been undertaking gradually the duties connected with the defence of the Union, and on 1st December, 1921, the Imperial Military Command in South Africa was abolished and the responsibility for the coast fortress defences of the Cape Peninsula formally taken over by a Union Commander. The Imperial Government has endowed the Union with a free gift of all its land and buildings in the Union actually required for defence purposes; the conservation of this endowment is provided for in the *Defence Endowment Property and Accounts Act* (No. 33 of 1922).

The Defence system is laid down in the *Defence Act* (No. 13 of 1912, as amended by Act No. 22 of 1922). Under this Act every citizen of European descent is liable between his seventeenth and his sixtieth year (both included) to render in time of war personal service in defence of the country in any part of South Africa within or without the Union. Further, every citizen of sound physique between his seventeenth and his twenty-fifth year (both included) is liable to undergo a course of peace training for four years. All employers are bound by law to afford their employees facilities for training without in any way prejudicing their employment. A minimum of 50 per cent. of those liable for peace training is required annually; others being required in their twenty-first year to enrol as members of rifle associations for the same period of four consecutive years. As an alternative, citizens may enter for service in the South African Division of the Royal Naval Volunteer Reserve. Every other citizen liable to render war service is also allowed to engage as a member of a rifle association if he elects to do so. The liability of non-Europeans to service may be determined by Parliament.

2. **Administration.**—A Council of Defence, a headquarters staff, and instructional and administrative staffs for the fifteen military districts of the Union have been constituted.

The personnel of the Council of Defence (as constituted in July, 1925) is as follows:—

*Major-General Sir H. T. Lukin, K.C.B., C.M.G., D.S.O.
F. A. Conroy, M.L.A.
Brigadier-General J. S. Wylie, D.S.O., M.V.O., V.D.
Captain W. Wilkens.

3. **Military Districts.**—The Union is divided into fifteen military districts, with headquarters of the district staff officers at the places named.

No. 1	Military District,	Cape Town.	No. 9	Military District,	Pretoria.
No. 2	,,	Port Elizabeth.	No. 10	,,	Bloemfontein.
No. 3	,,	East London.	No. 11	,,	
No. 4	,,	Pietermaritzburg.	No. 12	,,	Kimberley.
No. 5	,,		No. 13	,,	
No. 6	,,	Standerton.	No. 14	,,	Worcester.
No. 7	,,	Potchefstroom.	No. 15	,,	Graaff-Reinet.
No. 8	,,	Johannesburg.			

4. **The South African Permanent Force.**—This Force consists of:—

I. The South African Staff Corps.
II. The South African Instructional Corps.
III. The South African Naval Service.
IV. The South African Field Artillery.
V. The 1st Regiment, South African Mounted Riflemen.
VI. The South African Permanent Garrison Artillery.
VII. The South African Engineer Corps.
VIII. The South African Air Force.
IX. The South African Service Corps.
X. The South African Medical Corps.
XI. The South African Ordnance Corps.
XII. The South African Veterinary Corps.
XIII. The South African Administrative, Pay, and Clerical Corps.

5. **The South African Military College.**—This college was organized in 1912 for the training and instruction of officers and other ranks of the Permanent Force, Citizen Force, and Cadets. It was originally stationed at Tempe, but was transferred in recent years to Roberts Heights.

The college consists of three branches—the General Branch, Musketry and Signalling Branches.

6. **The Coast Garrison Force.**—This force consists of the South African Garrison Artillery and Coast Defence Corps. Divisions of the Garrison Artillery are established at

* Died 16th December, 1925; successor, Major R. Ballantine, V.D.

Cape Town and Durban, and men below the age of thirty are eligible for enrolment, and receive liberal payment for attending drills. Citizens liable for peace training may serve their time in this force. During the year ended 30th June, 1925, the First Division of the South African Garrison Artillery—No. 1 Military District—(Cape Garrison Artillery) was accepted for peace training. The Coast Defence Corps consists of men specially trained in harbour work, engineering, signalling, and telegraphy.

7. **The Citizen Force.**—This force consists of all persons liable to render personal service in time of war (other than members of the other forces mentioned) and comprises three divisions, viz., the Active Citizen Force, the Citizen Force Reserve, and the National Reserve.

8. **Registration.**—All citizens of the Union are required to register themselves under the Defence Act during January of the year in which they will reach the age of seventeen. Any person who becomes a citizen between his seventeenth year and his twenty-first year must register himself within ninety days of his becoming a citizen.

Failure to register, constitutes an offence punishable by law.

The position at the 31st March, 1925, in regard to the 1925 registration of citizens, is reflected hereunder.

REGISTRATION, 1925—POSITION AT 31st MARCH, 1925.

Military District No.	Number liable for Registration.	Total Number Registered.	Total Voluntary Entries.		Total Non-Voluntary Registrations.
			Mounted.	Infantry and Dismounted.	
1	1,389	834	7	788	39
2	1,712	941	38	798	105
3	1,045	866	89	721	56
4	554	463	252	173	38

11	1,127	817	186	566	65
12	634	258	76	169	13
13	687	392	77	303	12
14	1,258	692	32	620	40
15	1,103	574	78	465	31
TOTAL	18,429	11,591	1,914	8,804	873

9. **The Active Citizen Force.**—This force consists of registered citizens between the ages of seventeen and twenty-five who are undergoing peace training, and citizens with previous military training who have been specially enrolled.

During the training year 1925–26, the following units were accepted for peace training :—

Unit.	Military District No.	Unit.	Military District No.
Cape Garrison Artillery	1	5th Mounted Rifles (I.L.H.)	–
2nd Infantry (D.E.O.R.)	–	8th Infantry (T.S.)	–
6th " (D.C. & S.O.C.H.)	–	10th " (Wit. Rifles)	–

(Railway and Harbours Brigade)

10. **South African Naval Service.**—The South African Naval Service consists of the following units:—

(i) South African Division, R.N.V.R., which embraces citizens liable for peace training who elect to perform naval service. Companies are established as follows:—A and B Companies based at Cape Town (headquarters, The Castle); C Company at Durban (headquarters, Esplanade, Durban); D Company at Port Elizabeth; E Company at East London.

(ii) two mine-sweeping trawlers, "Foyle" and "Eden" (renamed "Sonneblom" and "Immortelle" respectively).

(iii) one surveying sloop, "Crozier" (renamed "Protea").

These units are administered under the orders of the Commander-in-Chief, Africa Station, by the Commander, S.A. Division, whose headquarters are at Simonstown.

11. **Naval Dockyards (Simonstown).**—The headquarters of the African Naval Station are established at Simonstown, where extensive dockyards (including a large graving dock) have been formed for Admiralty purposes. The buildings belonging to the station provide a full equipment of naval offices, stores, and workshops, and a hospital. The tidal basin has an area of 28¼ acres. The graving dock—known as the Selborne Dock—is 780 feet long, 94 feet wide, and has a depth over sill of 34 feet 5 inches (high water ordinary neap tides).

The dock and dockyard are available, on application to the Captain-in-Charge, Simonstown, for the docking and repairs of merchant ships, provided that the facilities desired are not available at the time elsewhere in Union waters, and that men-of-war have priority.

12. **South African Air Force.**—The South African Air Force is part of the Union Defence Forces, and is administered by the Air Services Section of Defence Headquarters. The Director of Air Services is also the executive commander of the Air Force.

The organization of the force is—

(1) headquarters;

(2) aircraft depot, including stores section, workshops, and reserve aeroplane park;

(3) flying training school, capable of training fifteen to twenty pupils at the same time;

(4) service squadrons, of which one squadron is at present fully established;

(5) special reserve of pilot officers on a numerical establishment of twenty-four special reserve officers to each active aeroplane flight;

(6) general reserve of officers.

The whole of the Permanent Air Force is concentrated at Pretoria, where accommodation has been provided in the shape of steel hangars for approximately eighty aeroplanes. Nearly one hundred landing grounds have been prepared throughout South Africa, and any point in the Union can be reached by air from Pretoria within one day.

13. **The Citizen Force Reserve.**—This force is divided into two classes. Class A consists of men who have undergone peace training in the Active Citizen Force and are not over forty-five years of age. Class B consists of members or past members of Defence Rifle Associations.

14. **The Coast Garrison Force Reserve.**—The Coast Garrison Force Reserve consists of all members of the Coast Garrison Force who have completed a prescribed period of training and service in that force and who have not passed their forty-fifth year.

15. **The National Reserve.**—This embraces all citizens between the ages of seventeen and sixty years who are not serving in any other portion of the Defence Forces. After the whole of the Active Citizen Force and the Citizen Force Reserve have been mobilized in time of war, the National Reserve may be called out in three classes according to age.

16. **Rifle Associations.**—All citizens who are required to register themselves but who do not undergo peace training are required to serve for four years in a rifle association. Every such citizen will be enrolled as a member of a rifle association on the 1st July, in his twenty-first year. Any other citizen liable to render personal service in time of war, not being a member of the Permanent Force, the Coast Garrison Force, or the Active Citizen Force, may become a member of a rifle association on prescribed conditions; also boys between the ages of thirteen and seventeen residing in areas where no facilities for cadet training exist. Rifles are provided for members of these associations free of charge on a percentage basis, or members may purchase Government rifles at cost price. A free issue of ammunition is made to all members annually.

NUMBER AND MEMBERSHIP OF DEFENCE ASSOCIATIONS, BY PROVINCES, 1923–24.

Province.	Number of Associations.	Membership.		
		Officers.	Other Ranks.	Total.
Cape of Good Hope	447	867	46,836	47,703
Natal	60	67	3,430	3,497
Transvaal	373	1,194	57,387	58,581
Orange Free State	250	510	26,725	27,235
UNION, at 30th June, 1924	1,130	2,638	134,378	137,016
At 30th June, 1923	1,087	2,527	133,872	136,399

17. **Cadets.**—In addition to the various forces enumerated, boys between the ages of thirteen and seventeen in all parts of the Union where facilities for proper training can be arranged are required, unless their parents or guardians object, to become cadets. A cadet who has served efficiently for three years is entitled to a certificate which has the effect of securing a diminution of the subsequent training in the Citizen Force. All arms and equipment for cadet training are issued, and the cost of training is provided, at the public expense.

The following statement shows the number of officers and cadets in each of the four Provinces at 30th June, 1913, 1923, and at 20th March, 1924 :—

Provinces.	1913.		1923.		1924.	
	Officers.	Cadets.	Officers.	Cadets.	Officers.	Cadets.
Cape	177	3,943	472	17,671	455	17,131
Transvaal	135	3,173	418	14,491	463	15,824
Natal	32	3,858	70	4,055	55	4,043
Orange Free State	—	—	76	2,903	91	3,599
TOTAL	344	10,974	1,036	39,120	1,064	40,597

18. **Commission of Inquiry.**—Early in 1925, a Commission of Inquiry, appointed by the Governor-General, consisting of Major-General Sir H. T. Lukin, K.C.B., C.M.G., D.S.O.; Lieutenant-Colonel D. Hugo, M.L.A., and G. B. Steer, Esq., M.P.C., to inquire into complaints of alleged discrimination on other than grounds of military efficiency and suitability in promotion and acceptance of cadets, and other matters alleged to be discordant with good order and discipline and the welfare of the South African Permanent Force, issued its report (U.G. 20—'25).

§ 3. Miscellaneous.

1. **South Africa and the European War.**—A brief account of the activities of the Union in connexion with the European War (1914–19) was given in the fifth issue of this *Year Book*, reference being made to military operations undertaken by the Union Government, the dispatch of the overseas expeditionary forces, the numbers on active service, and the casualties sustained in different theatres of war, the steps taken towards demobilization and the special war legislation passed during the period.

2. **Custodian of Enemy Property.**—The Custodian of enemy property was appointed under the *Trading with the Enemy Act* (Act No. 39 of 1916), which came into force on the 22nd June, 1916. The principal functions of the Custodian were the following :—

(*a*) To collect moneys, to liquidate businesses, and to control firms and businesses belonging to enemies or of enemy association.

(*b*) To examine and prepare statistics required by the courts in connexion with applications for vesting or of sale of property.

(*c*) To enforce the prohibitions with regard to trading with enemies.

(*d*) To administer the estates and property vested and to register claims by British subjects in the Union against enemy persons, firms, or companies.

(*e*) To control sums of money sent overseas for the maintenance of certain persons in enemy territory.

The value of the assets in the Union controlled by the Custodian at 31st December, 1924, amounted to approximately £15,549,282. The disposition of enemy assets is now dealt with under Proclamation No. 101 of 1924, issued in execution of the Treaties of Peace, as amended by Proclamation No. 308 of 1924.

Under the *Financial Adjustments Act*, 1925, provision was made for the Union Treasury to take over the liabilities and assets of the Custodian, and it was anticipated that the work of the Custodian would be completed and the office abolished in the course of the year 1925.

CHAPTER XI.

LAND SURVEY, TENURE, AND OCCUPATION.

§ 1. Land Survey.

1. **Legislation.**—There is as yet no general law governing the admission of land surveyors to practise as such in the Union. In the Transvaal the law at present in force is Ordinance No. 55 of 1903, as amended by Ordinance No. 8 of 1904. In the Orange Free State, Ordinance No. 16 of 1903 applies. Neither in the Cape Province nor in Natal is there any specific law on the subject. The necessary qualifications are laid down in Government proclamations in accordance with long established usage or practice. Although the laws or proclamations differ slightly in detail, the essentials are the same.

A candidate for admission to practise as a land surveyor in any one of the Provinces of the Union to-day must have—

(*a*) attained the age of twenty-one years;
(*b*) passed the examination in the Theory of Land Surveying;
(*c*) served for at least two years in the field with a duly admitted surveyor; and
(*d*) performed to the satisfaction of the Surveyors-General a trial survey in which his practical knowledge of the methods of surveying, use and adjustment of instruments, framing of plans and diagrams, and of the land laws of the country, will be tested.

The following persons are entitled to be admitted as candidates for the examination in the Theory of Land Surveying:—

(i) Any graduate by examination of a university recognized by the Joint Committee.

(ii) Any person who has passed the Matriculation Examination of the University of the Cape of Good Hope.

(iii) Any person who has passed the Senior Certificate Examination of the University of the Cape of Good Hope, including as subjects mathematics and French or German.

(iv) Any person who, not less than one academic year previously, has obtained the matriculation certificate issued by the Joint Matriculation Board, or has received exemption from the Matriculation Examination, provided he has qualified in mathematics at matriculation or other equivalent examination.

The examination is conducted in two parts, but the Joint Committee for Professional Examination may exempt from examination in any subject in Part I a candidate who has passed an examination deemed of equivalent standard, and provided, further, that candidates who have passed in Part I of the old regulations will be exempted from examination in the corresponding subjects in Part I of the amended regulations. No person may be admitted to Part II until the expiration of one academic year after passing the examination in Part I, or such other examination as the Committee may recognize in lieu of Part I.

A surveyor admitted to practise as such in any one of the Provinces of the Union may, on application to the Secretary for Lands, in terms of the *Land Surveyors' Recognition Act*, No. 25 of 1917, obtain a certificate entitling him to practise in any one of the other Provinces.

The adoption of a general survey law for the whole Union is anticipated, consolidating the various laws, regulations, tariffs, fees of office, etc., presently in force in the four Provinces.

A note on the principles underlying survey practice in the Union will be found in the sixth and previous issues of this *Year Book*.

2. **Triangulation.**—Owing partly to the fact that there is little forest in the Union, and partly to the country being generally of a hilly or mountainous nature, land surveying in the Union is carried out almost entirely by means of triangulation, the chain or measuring

tape being used only for the determination of the lengths of base lines or of comparatively short distances for the fixation of points not easily accessible by triangulation.

In addition to the ordinary property surveys which, though sufficient for the purpose of title or transfer, are of little practical value in the compilation of comprehensive and accurate maps of South Africa, some important triangulation surveys have been carried out. The most notable are those made of selected portions of the Cape Province by Sir Thomas Maclear, Her Majesty's Astronomer, between 1841 and 1848, and by Captain W. Bailey, R.E., between 1859 and 1863; but by far the most extensive and important survey operations which have been carried out in the country are the primary triangulation which was performed between the years 1882 and 1893 by Lieutenant-Colonel Morris, R.E., under the direction of Sir David Gill, Her Majesty's Astronomer, and which intersects the Cape Province and Natal by a series of chains of triangles, and the subsequent extension of this triangulation through Natal, the Orange Free State and the Transvaal to Rhodesia.

Since the completion of the primary chains of triangulation, the filling up of the large spaces enclosed by them had up to the end of 1922 not been attempted, but a commencement with this important work was made in the early part of 1923 under the direction of Mr. W. C. van der Sterr, Director of Trigonometrical Survey for the Union.

Reconnaissances for primary triangulation covering (*a*) the divisions of Murraysburg, Graaff-Reinet, Aberdeen, and parts of Beaufort West, Victoria West, Richmond, Middelburg, Somerset East, Cradock, Willowmore, and Prince Albert in the Cape Province; (*b*) the divisions of Albert, Aliwal North, Wodehouse, Molteno, Glen Grey, Queenstown, Tarka, and parts of Philipstown, Colesberg, Steynsburg, Cradock, Cathcart in the Cape Province, and a part of the southern portion of the Orange Free State, have been completed. The erection of beacons has been proceeded with and the work of observations was well advanced by the end of 1923. A reconnaissance for primary triangulation to fill the large open space enclosed by the primary chain between parallels 25° 30″ S., and 27° 30″ S., and longitudes 28° and 30° E., partly in the Transvaal and Orange Free State Provinces is in progress. An important reconnaissance for the purpose of ascertaining the feasibility of incorporating the results of the topographical triangulation performed by the Geographical Section of the General Staff in the Orange Free State during the years 1905–11, and an examination of the stations and centre marks has been completed and concrete beacons with quadripod signals have already been erected at many of the stations preparatory to the work of observing. The primary triangulation and its extensions will form the framework upon which the general survey of the Union is gradually being made.

As contributions to the general survey, several triangulations of a secondary order, based on the primary triangulation, were carried out in the Cape Province under the direction of the late Mr. J. J. Bosman, and in Natal under the direction of Mr. A. Hammar. On the retirement of the former in 1919, Mr. W. C. van der Sterr was appointed Director of Trigonometrical Survey of the Union, and the work of the secondary triangulation has been continued in these Provinces, as well as in the Transvaal. A continuous belt of secondary triangulation, embracing the coastal districts and extending inland from the coast to a depth ranging from fifty miles to 140 miles, from the division of Clanwilliam on the west to Zululand in Natal, has been completed, as well as secondary triangulation covering large portions of the Victoria West and Richmond districts, and a chain of triangulation embracing the Orange River from Herbert to the vicinity of Upington, and thence on to join the primary triangulation in the division of Kenhardt, besides a small chain from Carnarvon to Williston, and a small portion of Van Rhynsdorp. Two important extensions of the gold fields triangulation have also been completed. Secondary triangulation is proceeding in the Vryheid and Zululand districts of Natal, as well as a coast triangulation between Durban and the Bashee River for the purpose of hydrographic survey by the South African Naval Service, the divisions of Somerset East, Bedford, Cradock, Middelburg, Herschel, Barkly East, Elliot, Calvinia, Clanwilliam, Hanover, Britstown, Hopetown, in the Cape Province; the districts of Pretoria, Heidelberg, Witwatersrand, Potchefstroom, Middelburg, and Lydenburg in the Transvaal, including a further important extension of the gold fields triangulation; and the districts of Heilbron and Kroonstad in the Orange Free State.

3. **Government Supervision of Survey.**—In each Province is a Surveyor-General who controls the survey of all Government land, and employs duly admitted surveyors for this work at a tariff fixed by law or regulation. After land is once alienated from the Crown, the Surveyor-General has no further concern with its subsequent subdivisions beyond the examination of the diagrams necessary for effecting transfer of the portions, which as above mentioned must bear his certificate of approval before being accepted for registration in a Deeds Office.

The subdivision of private property may only be performed by surveyors admitted to practise in that Province in which the property is situate. The cost of these surveys is a matter of arrangement between the owner and the surveyor, though the Institutes of Land Surveyors in each Province have fixed tariffs at which most surveys of private property are made.

During the year 1924, 18,491 sets of diagrams were examined in the several Provinces, as follows :—

Cape Province	6,952 sets.
Natal	5,080 ,,
Transvaal	4,869 ,,
Orange Free State	1,590 ,,

4. **Scale of Fees.**—The following are the more important items in a scale of fees chargeable in the offices of the Surveyors-General, as from the 1st April, 1922 :—

SCALE OF FEES CHARGED IN THE OFFICES OF THE SURVEYORS-GENERAL.

	£	s.	d
Examination Fee—			
The examination of a diagram of any piece of land, excluding diagrams of Crown land :—			
For any number of sides up to six inclusive	0	10	0
For each additional side over six	0	1	0
The examination of general plans of townships, framed in terms of the Proclamation of Townships (Transvaal) Ordinance, 1905, and Townships (Transvaal) Act, 1907, per figure	0	1	0
Deduction Fee—			
For deduction of each figure which is represented on a diagram or the laying-off of a servitude (e.g. composite diagram made up of three separate figures—fee 15s —for deductions)	0	5	0
Copies of Diagrams and Tracings, Including Certification—			
Certified copy of each diagram of land not exceeding 10 morgen in extent	0	9	0
Certified copy of each diagram of land exceeding 10 morgen :—			
For a figure of not more than six sides	1	0	0
For each additional side	0	1	0
For each deduction shown on the copy of the diagram	0	1	6
For each copy of a general plan (including plans of townships) : For the time taken on the preparation of the plan	0	5	0 per hour.
Miscellaneous Certified Copies—			
For every certified copy of any document not specified above :—			
For the first 100 words	0	2	6
For every additional 100 words or fraction thereof	0	1	0
For checking and certifying additional copies of a diagram	0	3	6
Certificate—			
For each certificate endorsed on a diagram, tracing, or other document	0	1	0
Searches—			
For every search made in the Offices of the Surveyors-General :—			
For the first hour or portion thereof	0	3	0
For each subsequent half hour or portion thereof	0	1	0
Land Surveyors' Registration Fee—			
Fee for registration as land surveyors upon admission to practise in each Province	5	5	0

§ 2. Tenure and Occupation of Crown Lands.

1. **Land Laws of the Union.**—Prior to the establishment of the Union each Province administered its Crown lands under certain statutory provisions which are referred to in this Chapter under the heading of the respective Provinces. The *Land Settlement Act*, promulgated in October, 1912, was the first land law of the Union Parliament to bring about uniformity of practice in the four Provinces in relation to the acquirement, exchange, and disposal of Crown lands. The Act, which is additional to and not in substitution for any prior law, has proved generally satisfactory in its operation, and has shown that a public need has been met. During the period which has elapsed since the Act was passed the further requirements of lessees and the requirements of new applicants have been gauged. In the light of the experience gained and with a view to meeting these wants and improving the terms and conditions provided by the original Act, amending Acts—No. 23 of 1917, No. 28 of 1920, No. 21 of 1922, No. 38 of 1924, and No. 26 of 1925—have been passed. These six Acts together embody the provisions under which active land settlement in the Union is at present conducted.

2. **Land Settlement Acts.**—The main provisions of these Acts empower the Minister of Lands, *inter alia*—

(*a*) to acquire private land by purchase or exchange for land settlement purposes, and, after division into suitable holdings and advertisement in the *Government Gazette* and local newspapers (giving full details as to terms, price, and the like), to dispose of such land or any other Crown lands similarly treated to approved applicants, on lease for five years with an option to purchase extended over forty years;

(*b*) to acquire and allot particular land selected by an applicant who is prepared to contribute in cash at least one-tenth of the total cost thereof;

(*c*) to make advances not exceeding £500 in amount to lessees under the Act for the purpose of developing their holdings;

(*d*) to cause boring operations to be effected or improvements of a substantial nature to be erected or constructed, and to add the cost thereof to the purchase price of holdings;

(*e*) to grant temporary occupation of certain Crown land to probationary lessees and allot holdings on closer settlements to probationary lessees upon satisfactory completion of a course of training.

The procedure in regard to the allocation of Crown lands is as follows:—

(i) *Land Boards.*—The Minister is assisted by five Land Boards, each of five members, and to these bodies all matters under the Act are referred for consideration, advice, report, or recommendation.

(ii) *Qualifications.*—For land under 2 (*a*) and (*b*) the applicant must (*a*) be at least eighteen years of age; (*b*) possess qualifications sufficient for utilizing the land; (*c*) intend to occupy, develop, and work the holding; (*d*) be of good character.

(iii) *Terms.*—For land under 2 (*a*)—leased farms—the principal terms are that—

(*a*) The lease shall be for five years.

(*b*) The rentals charged on the purchase prices shall be (1) for the first year, nil; (2) for the second and third years, 2 per cent. per annum; (3) for the fourth and fifth years, 3½ per cent. per annum, payable half-yearly in advance.

(*c*) The lease may, with the Minister's consent, be extended for a further period not exceeding five years at a rental of not less than 4 per cent. per annum on the purchase price.

(*d*) The option to purchase a holding by paying the purchase price over a period of forty years can be exercised at any time with the Minister's consent, subject to the lease conditions being fulfilled and improvements to the value of 10 per cent. of the purchase price being constructed on the holding.

(*e*) Instalment payments on every £100 of purchase price amount to £5. 0s. 8d. (i.e. 5·03 per cent.) per annum, which includes interest at 4 per cent., and the residue is apportioned to capital, the interest payment diminishing and the capital payment increasing after each instalment (which remains the same throughout) is paid. The payments must be made half-yearly in advance.

For land under 2 (*b*)—farms specially purchased for applicants—the principal terms are that—

(*a*) There must be a lease on which the option to purchase is exercised from the date of transfer of the land to the Government.

(*b*) For the first two years the payments are nil; for the subsequent thirty-eight years the purchase price, plus interest at 4 per cent., is paid in half-yearly instalments in advance.

(*c*) On every £100 of purchase price appearing in the lease, the yearly payment would amount to £5. 2s. 10d., i.e. 5·14 per cent., which includes interest at 4 per cent., and the residue is apportioned to capital, the interest payment diminishing and the capital payment increasing after each instalment (which remains the same throughout) is paid. The payments must be made half-yearly in advance.

(*d*) One-tenth of the total price at which the land was sold must be paid by the lessee before allotment.

(*e*) The purchase price of the holding payable as in (*b*) above, is made up of (1) the purchase price paid by the Minister; (2) the cost of transfer and the survey fees; (3) other expenditure by the Minister in connection with the purchase, transfer, and allotment of the land; (4) interest for a period of two years at the rate of 4 per cent. per annum on the aggregate of the amounts mentioned in (1), (2), and (3), but the contribution made towards the purchase price by the lessee is excluded from that aggregate.

The one-tenth contribution is excluded from the above amount in arriving at the purchase price payable over thirty-eight years by a lessee.

(iv) *Conditions.*—For land under 2 (*a*) and (*b*) the conditions provide for—

(*a*) personal occupation;
(*b*) care of improvements and trees;
(*c*) no sub-letting, mortgaging, or transfer without authority;
(*d*) the holding to be utilized for agricultural and pastoral purposes;
(*e*) the reservation of all minerals, except in the case of land under 2 (*b*), when on issue of Crown Grant the mineral rights, withheld during the lease period, are granted;
(*f*) the liability of the lease to cancellation should its terms or the provisions of the Act not be complied with;
(*g*) the land to be improved, when no improvements exist at the date of allotment, within the first five years by improvements to the extent of 10 per cent. of the value of the holding;
(*h*) no compensation for improvements on cancellation of the lease, but if on re-allotment of the land an incoming tenant pays for the improvements, the outgoing lessee will be paid such amount, less debts owing to the Government;
(*i*) capital instalments of the purchase price being repaid on cancellation, less debts and in the case of land under (2) (*b*) that the Minister may repay the one-tenth contribution made.

(v) *General Provisions.*—There are certain general provisions in the Act dealing with (*a*) the addition to the purchase price of the cost of improvements which may be made by the Minister for boring and the like, and the consequent increase of the annual payments; (*b*) the cancellation of the interests of joint holders in land, if all the lessees do not comply with the terms of the lease; (*c*) the transfer of a lessee's interests to another qualified person; (*d*) the allotment of land to persons oversea, who must apply through the High Commissioner in London; (*e*) allotment of holdings on condition of payment of part purchase price thereof; (*f*) issue of Crown Grants to lessees on hypothecation of holding for amount of indebtedness to the Government; (*g*) the capitalization of arrears due till 30th June, 1925, and the consolidation of advances made in terms of section 44 of the Act; as well as other provisions governing particular circumstances.

3. **Advances to Lessees.**—The Act provides for advances being made to lessees up to an amount of £500 for the purchase of stock, implements, seeds, and other things necessary for the development of the holding. The Minister may also effect certain improvements on any holding out of public moneys and add the cost thereof to the purchase price of the land, or treat the amount as an advance. The advances are repayable over five years from the date on which they are made, and interest is at the rate of 4 per cent. per annum. In special circumstances the Minister may extend the time of repayment for periods not to exceed five years.

4. **Advances to Lessees of Town Lands and Commonages.**—An amendment to the Act now admits of advances being made for the purchase of cattle to assist persons who have leases of lots within any area or settlement laid out for farming or agricultural purposes by any local authority on town lands or commonages, provided that the Land Board within whose area the land is situate recommends the application.

Conditions.—The stock is the property of the Government and must be branded. On the termination of the lease held by the debtor the moneys due to the Government for the advance become repayable.

5. **Statistics: Results of Working of the Land Settlement Act.**—The operations under sections 16–20 of the Act, in terms of which sections the land is leased for five years with an option of purchase over twenty years, are as follows:—

ALLOTMENTS MADE UNDER SECTIONS 16–20 OF THE LAND SETTLEMENT ACT 1912,* TO 31st MARCH, 1924.

Province.	1st April, 1923, to 31st March, 1924.				1912 to 31st March, 1924.		
	Number of Holdings.	Number of Settlers.	Area.	Valuation.	Number of Settlers.	Area.	Valuation.

* Passing of Act at end of 1912. † 1 Morgen is equal to 2·1165 acres.

(i) *Section 11 of the Act.*—This Section, which provides for land being purchased specially for applicants who are prepared to contribute one-tenth of the purchase price, was suspended, owing to the outbreak of the War, and no transactions were effected thereunder subsequent to August, 1914. During the session of Parliament in 1917, however, further funds were voted to enable purchases of land to be made in terms of Section 11. A table showing particulars of the operations under this section from the passing of the Act at the end of 1912 is given hereunder :—

Natal.....	19,879	134,031	64	82
Transvaal.....	358,121	1,273,087	913	1,159
Orange Free State.....	33,007	132,269	72	84
TOTAL.....	474,885	1,783,962	1,220	1,525

* Passing of Act at end of 1912. † 1 Morgen is equal to 2·1165 acres.

Contributions by the Government in respect of the purchase price, including interest, transfer costs, and other incidental expenditure, amounted to £1,400,502, and contributions by the persons assisted to £383,460, representing a total of £1,783,962.

(ii) *Section 10 of the Act.*—This section provides for the purchase of land for subdivision into suitable farms for allotment to the public. The total amount expended from the year 1912 in acquiring land under this section amounted to £1,289,215, the area purchased being 291,490 morgen.

6. **Other Laws of the Union.**—The other land laws which have been introduced since the establishment of the Union affect lessees and their land in a particular Province, and are dealt with later in this summary. The main Acts are the *Transvaal and Orange Free State Land Settlements Amendment Act*, 1912 (Act No. 15 of 1912) and the *Transvaal and Orange Free State Land Settlements Act Further Amendment Act*, 1916 (Act No. 16 of 1916). These Acts deal with settlers placed on Crown lands in the Transvaal and the Orange Free State by the Crown Colony Governments between the years 1902 and 1907, and enable those settlers to secure freehold of their holdings on passing a mortgage bond in favour of the Government for the amount of the purchase price of the land, plus the amount owing for advances. In the Transvaal the total sum due is repayable over thirty years, with interest at 4 per cent. by equal half-yearly instalments payable in advance ; in the Orange Free State it is repayable before the expiration of thirty years, during which period interest at 4 per cent. is repayable half-yearly in advance.

7. **Cape of Good Hope Province.**—The disposal of Crown lands in the Cape Province was regulated prior to the establishment of the Union by various Land Acts, dating more particularly from 1887 to 1908, and was on the basis of parliamentary control.

(i) *Act No. 15 of 1887.*—The principal Act in the Cape dealing with the disposal of Crown lands is Act No. 15 of 1887, and in a sense all other Acts in force with regard to the alienation of such land may be said only to establish exceptions to this Act. The land is offered at public auction at an upset price. In cases where the purchase price exceeds £25, twelve calendar months are allowed for the payment of one-fifth thereof, while a mortgage in favour of the Government for the remaining four-fifths may be passed bearing interest at 5 per cent. per annum.

The Act further provides for the granting of land for special public purposes, for carrying on trade in native locations, for grants to municipalities, for the disposal of small pieces of Crown land between farms (uitval grond), and for leases of irrigable lands, fishing stations, seaside resorts, and the like.

(ii) *Act No.* 37 *of* 1882.—This Act authorizes the disposal of land from four to two hundred and fifty morgen in extent on a five years' licence entitling the holder to receive a grant at the end of the term, subject to a perpetual annual quitrent. The licence fee and the annual quitrent payments are the same and amount to one-twentieth of the valuation at allotment. The quitrent can at any time be redeemed by the payment of a total sum equal to twenty times the annual instalment.

(iii) *Act No.* 40 *of* 1895.—This Act is an elaboration of the principle established by Act No. 37 of 1882, and provides a scheme for land settlement for use in large areas on non-arable or slightly arable land. The purchase price is payable in twenty equal annual instalments. A successful applicant obtains a licence to occupy a farm for five years, during each of which he pays one-twentieth part of the purchase price. After five years, if the licence conditions have been complied with, or after two years if improvements at least equal to the value of the purchase price have been effected and the licence conditions have been fulfilled, title to the land is granted, on a mortgage bond in favour of the Government being passed to secure payment of the remaining instalments.

(iv) *Act No.* 42 *of* 1908.—Act No. 40 of 1895 was amended to some extent by this Act, which also provides for the issue of water prospecting licences over dry areas of unsurveyed Crown lands. If water was found the successful licence holder would be entitled to receive a licence over about 21,000 acres for five years with subsequent conversion to title on the lines governed by Act No. 40 of 1895. The operation of the Act has been suspended.

(v) *Act No.* 26 *of* 1891.—This Act deals with the sale of certain lands bought or improved by Government, and provides also for leasing land for five years without the option of purchase.

(vi) *Act No.* 23 *of* 1893.—This Act permitted the Government to dispose of land acquired by the Rhodesian Railways in Bechuanaland from the Bechuanaland Government, in which the Cape Government held an interest.

(vii) *The Land Settlement Act*, 1912, is, of course, operative in the Cape Province, and Crown land for disposal is also dealt with under that Act.

(viii) *Act No.* 8 *of* 1922.—This Act amended the provisions of Act No. 15 of 1887 to the extent that the Government was empowered to sell or lease any Crown land within the Cape Province or to exchange any such land for privately owned land.

8. **Natal Province.**—Prior to the passing of the *Land Settlement Act*, 1912, the only Act which dealt with land settlement in Natal was Act No. 44 of 1904, which was intended to aid and encourage the agricultural development of Natal. The Act, though amended, was found to be defective and unworkable, and operations thereunder have been suspended. The disposal of Crown lands, when not dealt with under the *Land Settlement Act*, 1912, is governed by rules and regulations promulgated by the Governor-General under the powers conferred upon him by Section 122 of the *South Africa Act*.

(i) *Proclamations, etc.*—The main Proclamations issued are :—

(*a*) *No.* 121 *of* 1924, dealing with the disposal of Crown lands in Natal (including Zululand) other than sugar-cane lands, Crown reserves, special reserves, and township lands.

(*b*) *No.* 103 *of* 1911, providing for the disposal of lands in the divisions of Ixopo Bergville, Impendhle, New Hanover, Ipolela, Dundee, and Lions River. These lands were acquired by the Government of the Colony of Natal for closer settlement.

(*c*) *No.* 219 *of* 1911, providing for the disposal of Crown lands in Natal (including Zululand) set apart for the cultivation of sugar-cane.

(*d*) *No.* 170 *of* 1923, dealing with the disposal of Crown lands in Government townships and urban areas in Natal.

All applications for land are considered by the Land Board, which advises the Minister with whom the final selection rests. No applications are considered from persons under eighteen years of age or who possess more than one hundred acres of land ; and personal occupation for nine months is required. The purchase price of ordinary Crown lands is payable in twenty equal instalments of capital and interest, the first of which is payable at the termination of the third year from the date of allotment. The sale price of acquired lands, the disposal of which is governed by Proclamation No. 103 of 1911, is payable in eighteen instalments, including interest at 5 per cent., the first instalment falling due at the end of the third year from the date of allotment.

(ii) *Sugar-Cane Lands.*—In the case of sugar-cane lands dealt with under Proclamation No. 219 of 1911 the terms and conditions are briefly as set out hereunder :—

(*a*) *Lease.*—For a period of ninety-nine years.

(*b*) *Rental.*—For the first and second years, nil. For the next succeeding twenty years an annual rental representing one-twentieth of the valuation of the land is charged ; thereafter an annual rental of one shilling per annum in respect of the remaining period of the lease.

(c) *Conditions.*—The reason for the issue of a ninety-nine years' lease is that before sugar lands are allotted, it is customary for the Government to arrange with a third party for the erection and working of a central mill to deal with cane grown by Crown allottees. There is no Government liability towards the mill-owners or the planters, but the former obtain from Government a lease of a suitable mill site, together with the sole crushing rights up to a stated limit of cane grown within a certain area by Crown allottees. These allottees are, under the terms of their leases, bound to enter into agreements for the crushing of cane at the central mill. The Government settles the terms of such agreements beforehand and safeguards as far as possible the allottees' interests.

(d) *Cultivation.*—The allottee is required to cultivate sugar-cane on at least 15 per cent. of his land during the first three years of his tenure, and thenceforward to maintain such area under cultivation.

(iii) *General.*—In Natal (including Zululand) grazing lands, being unalienated Crown lands not suitable for European settlement, are offered for tender under Proclamation No. 221 of 1914. Tenders are also invited from time to time for the disposal of erven in townships in terms of Proclamation No. 170 of 1923.

9. **Transvaal Province.**—(i) *Crown Land Disposal Ordinance*, 1903.—This Ordinance (No. 57 of 1903), as amended by the *Crown Land Disposal Amendment Ordinance*, 1906, may be termed the basis of land administration in the Transvaal. The *Transvaal Settlers Ordinance* of 1902 (No. 45 of 1902), which was later amended by the *Land Settlement Act*, 1907 (No. 37 of 1907), was the first Ordinance under Crown Colony Government to deal with what is usually termed land settlement. The funds from which settlers were assisted, and with which land was acquired, were furnished from the Guaranteed Loan, 1903, out of which £1,300,000 was set aside for general land settlement purposes.

(ii) *Crown Land Disposal Ordinance*, 1903 (*as amended*).—This Ordinance allows the Government generally to dispose of unalienated Crown lands by grant, sale, lease, or otherwise, and to exchange, donate, or reserve such land. Provision is also made for the establishment of a Land Board.

The powers of the Ordinance are wide, but the leases in force have been framed on the following basis :—

(a) *Leases with Option of Purchase :—*

(1) *Terms.*—Five years' lease. Renewal for further five years with the Minister's consent. The option to purchase is included in the terms.

(2) *Rental.*—for first and second years, 1½ per cent.. } on the purchase price.
for following three years, 2½ per cent... }
if lease extended, 4 per cent..... }

(3) *Option.*—If the option to purchase is exercised the purchase price is payable half-yearly in advance by equal instalments over twenty years, with interest at 5 per cent. The yearly amount on every £100 of the purchase price totals £7. 19s. 4d. (about 8 per cent.), of which 5 per cent. of the instalments is devoted to interest; the amount credited to interest decreases on each payment and the sum credited to capital increases.

(4) *Conditions.*—The essential conditions imposed embrace (a) personal occupation; (b) erection of a suitable residence within two years; (c) no sub-letting, assignment, or transfer without consent; (d) minerals reserved to the Crown; (e) no payment for improvements on cancellation.

(5) *Crown Grants.*—These may be issued after ten years, provided that the full purchase price is paid during that period and that the conditions of the lease are fulfilled.

Particulars of all land are advertised, and the Land Board deals with all applications submitted and makes a recommendation to the Minister as to the particular applicant to whom the land should be allotted.

(b) *Leases without Option of Purchase.*—These are usually issued where some impediment to the sale of the land exists, due to the land being mineralized or having been proclaimed under the mining laws.

(1) *Terms.*—Twenty-one years' lease.

(2) *Rental.*—The rental is determined in each case and advertised, but is generally 2½ per cent. on the value of the holding.

(3) *Conditions.*—The principal conditions applying to a lease are similar to those under (ii) (a) above.

Farms which are not considered suitable for disposal under the *Land Settlement Act*, 1912, are disposed of under the *Crown Land Disposal Ordinance*, 1903 (Transvaal).

(4) *Statistics.*—The following particulars show at a glance the operations under the Ordinance :—

WORKING OF CROWN LAND DISPOSAL ORDINANCE, TRANSVAAL (1903).

Description.	1st April, 1923, to 31st March, 1924.	Total result from passing of Ordinance to 31st March, 1924.
Lessees.....No.	83	1,559
Area.....Morgen*	231,110	1,646,761
Approximate valuation.....£	67,399	707,475

* 1 Morgen is equal to 2·1165 acres.

(iii) *Settlers Ordinance*, 1902 (*Transvaal*) (*as amended*).—The settlers who have been allotted holdings under this Ordinance, and who have generally become known as the "Milner Settlers," were until the granting of Responsible Government in 1907 dealt with by the Lands Department. Under the Letters Patent granting Responsible Government, a Land Board was established for five years to take over the control and administration of the Ordinance, and the land subject thereto was transferred to the Board. At the expiration of the Board's terms of office, in 1912, the administrative control was resumed by the Department.

The Settlers Ordinance as amended during 1907 by the promulgation of the *Land Settlement Act*, 1907 (Transvaal) makes provision as under :—

(*a*) *Leases.*—For five years, conditionally renewable for two further periods of five years, thus providing for a lease for a total period of fifteen years. The lease contains an option of purchase.

(*b*) *Rentals.*—1¼ per cent. for the first and second years ; 2½ per cent. for the third to fifth years, and on the first five years' extension of lease ; not less than 4 per cent. is charged on the purchase price for any further extension of lease.

(*c*) *Licences.*—When the option of purchase is exercised, the lease is determined and a settler obtains a licence from the date of cancellation of the lease, under which licence the purchase price is payable by instalments over thirty years bearing interest at 4 per cent. per annum.

On every £100 of the purchase price the payments are £5. 15s. per annum (5¾ per cent., of which 4 per cent. is interest). After the first payment the amounts in respect of interest decrease and the amount devoted to the reduction of capital increases.

(*d*) *Conditions.*—Provisions relating to personal occupation, erection of a suitable residence within two years, restrictions against sub-letting, assignment, or transfer, and provisions for the reservation of minerals to the Crown, are embodied in both lease and licence issued under the Ordinance.

(*e*) *Advances.*—Most of the settlers received advances from time to time of an average of £300 ; in some cases as much as £1,000 was advanced. The money was furnished from the Transvaal Guaranteed Loan out of which £1,300,000 was set aside for land settlement, and was supplemented by about £16,000 derived as revenue from the late Land Settlement Board.

(*f*) *Concessions.*—Many of the settlers were further assisted by the Crown Colony and late Transvaal Governments by a writing-off of advances, rent, and interest, but beyond mentioning the circumstance there is no necessity to particularize the extent of the concessions granted by the Government from time to time.

(*g*) *Statistics.*—On the dissolution of the Board in April, 1912, 440 settlers established on 380 holdings were handed over to the Department, and at the 31st March, 1923, 57 settlers were in occupation of 47 holdings on licence or lease under the *Settlers Ordinance*. The difference in the numbers for the two periods is accounted for by the settlers having availed themselves of the privileges of Act No. 15 of 1912 and taking out Crown Grants of their holdings.

(iv) *Transvaal and Orange Free State Land Settlements Amendment Act*, 1912.—During the year 1912 an Act was passed authorizing the issue of Crown Grants of holdings allotted under the respective Settlers Ordinances in force in the Provinces of the Transvaal and the Orange Free State. (This Act was later amended by Act No. 16 of 1916.) The Act provides for the issue, on the recommendation of the Land Board, of a quitrent title to the settler, subject to the passing of a bond in favour of the Government, securing any balance due in respect of the purchase price, or advances outstanding.

(*a*) *Terms.*—Payments due under the bond are made over a period of thirty years by equal half-yearly instalments bearing interest at 4 per cent. per annum.

(*b*) *Conditions.*—If the settler-mortgager desires to sell his holding, he must give the Minister an option of purchase at the price at which he desires to sell privately, and this option must be exercised by the Minister within one month, should he desire to take over the property.

10. **Orange Free State Province.**—(i) *General.*—In the Orange Free State a sum of £1,250,000 was allocated to land settlement purposes, from the Guaranteed Loan of £35,000,000. The Crown Colony Government also inherited land to the value of about £312,000 from the late Republic. Under the Letters Patent, when Responsible Government was granted in 1907 a Land Board was established for a period of five years, and the Board administered the schemes of settlement in that Colony. The principal Act administered by the Board was the *Land Settlement Ordinance*, 1902 (O.F.S.). With one exception the settlers established thereunder have taken advantage of the terms of Act No. 15 of 1912.

(ii) *Transvaal and Orange Free State Land Settlements Amendment Act*, 1912.—Shortly before demitting office the Board made certain proposals to the Government which resulted in the passing of the *Transvaal and Orange Free State Land Settlements Amendment Act*, 1912, which Act was amended in certain details at a later date. This Act enabled a settler holding land under the Ordinance previously quoted to obtain a Crown Grant for his land, provided that simultaneously with the registration of the Grant a bond in favour of the Government was passed to secure both the purchase price of the farm and the outstanding amount of the advances owing to the Government.

(*a*) *Settlers.*—556 persons held land under the Ordinance when the Board relinquished office, and the Board recommended that the majority should receive the advantages conferred by Act No. 15 of 1912.

(*b*) *Conditions.*—Interest at the rate of 4 per cent. is payable half-yearly in advance on the amount of the bond; the bond is for thirty years, and the amount must be liquiadted before or immediately on the expiration of that term. If the settler-mortgager desires to sell his holding, he must give the Minister an option of purchase at the price at which he desires to sell privately, and the option must be exercised by the Minister within one month, should he desire to take over the property.

On the dissolution of the Board in 1912 the administration of the Ordinance devolved upon the Department.

(*c*) *Total Bonds.*—At the 31st March, 1924, mortgage bonds were in force in the Orange Free State in respect of a sum of £509,982 due to the Government by settlers.

(iii) *Other Laws in the Orange Free State.*—Prior to the passing of the *Land Settlement Act*, 1912, the laws governing the disposal of Crown lands, other than for settlement purposes, were the *Crown Lands Small Areas Disposal Ordinance*, 1905, and the *Crown Lands Disposal Ordinance*, 1908.

These laws provide for the sale of Crown lands which are not of sufficient extent to be occupied as separate holdings.

11. **Method of Application for Vacant Crown Lands (Unadvertised).**—Applications by letter, addressed to the Secretary for Lands, Pretoria, may at any time be made for any portion of unsurveyed vacant Crown lands, from areas sufficiently large to be utilized as cattle ranches to areas small enough to form market gardens. Such applications indicate to the Department the district in which the demand for the vacant Crown land exists, and, if such a course is considered advisable, reports on the land are obtained. If the reports are favourable the land is surveyed, divided into farms and valued, particulars are advertised in the *Government Gazette*, and the applicant is afforded an opportunity of obtaining the land he may desire, his application being of course considered together with those of other applicants. Evidence of a demand for land is established by inquiry made for such land; by new conditions, such as the desire to establish cattle ranching, or to

undertake cotton growing on a large scale, and by the advent of railway communication. Manifestations in this direction are met by the particulars of Crown land being publicly advertised and the land being offered for allotment.

The High Commissioner for the Union of South Africa in London (address: Trafalgar Square, W.C. 2) is prepared to give general information and advice to persons, who may desire to take up farming pursuits in the Union, as to local conditions and farming possibilities in various parts of the Union.

12. **Advertised Crown Lands open for Application.**—The *Government Gazette* and the local newspapers publish from time to time lists of farms available for allotment. These lists contain information of a particular and general nature regarding the land offered, show under which Land Acts, and on what terms, the farms can be leased or acquired, and indicate when, and the manner in which, applications should be made. A form of application for such land is obtainable from any Magistrate. Farms of the kind referred to may be either vacant Crown land which has been surveyed into farms or land procured by purchase by the Government or by exchange for land settlement purposes.

13. **Method of Purchase.**—Section 11 of the *Land Settlement Act*, 1912, as amended by the *Land Settlement Act Amendment Act*, 1917, and Act No. 26 of 1925, provides for the purchase for an applicant of any land suitable for settlement within the Union. The following essential conditions are imposed:—

(*a*) The farm must not cost more than a total of approximately £1,650, of which the Government contributes a sum not exceeding £1,500, i.e. nine-tenths of the price.

(*b*) The applicant must be prepared to pay and deposit in cash one-tenth of the total cost to the Government.

(*c*) An option to purchase the farm must be obtained in favour of the Minister of Lands for a period of approximately six weeks.

(*d*) Land with onerous servitudes will not be considered, nor, generally speaking, will undivided portions be purchased.

(*e*) A letter addressed to the Secretary for Lands, Pretoria, must be written by the applicant, giving a description of the land indicating the total price to be paid and the applicant's readiness to contribute, in cash, one-tenth of the purchase price, and enclosing the option of purchase.

(*f*) The applicant must (1) be at least eighteen years of age; (2) possess qualifications sufficient for utilizing the land; (3) intend to occupy, develop, and work the holding; and (4) be of good character.

If, after an inspection of the holding by the Land Board concerned, the Minister decides to purchase, the land will be allotted to the applicant on a lease from the date on which it is transferred to the Government, and from that date the lessee exercises his option to purchase the land from the Government by the payment, over a period of thirty-eight years of half-yearly instalments in advance, the first of such instalments falling due two years after the date of transfer to the Government. The payments to be made over a year are thus approximately at the rate of 5·14 per cent., of which 4 per cent. is devoted to interest. While the instalments payable throughout the thirty-eight years remain the same, the amount apportioned to interest becomes smaller after each payment, and the amount by which the capital is paid off becomes larger. The particular advantages to be gained by a successful applicant for the purchase of land in the manner described are that he has the selection of the land which he desires to purchase, and is not in competition with numerous other applicants for the same land, as would be the case if he applied for advertised Crown lands, which are allotted after a selection from all the applicants has been made.

14. **Advances.**—The Government will consider, on the merits of each case, applications from persons for whom land has been purchased, for advances not exceeding £500 to assist them to purchase stock, seeds, and other farming necessaries, and may further aid those persons by sinking boreholes or making permanent improvements on their farms and adding the cost to the purchase price of the holdings.

15. **Financial.**—At the 31st March, 1924, there were 11,213 debtors on the books of the Department, the capital sum due to the Government for land sold, for advances made to settlers, and the like, amounting to £3,878,722. The collections during the year were: for rent £55,832 and for interest £98,026; while the arrears still owing under these two heads were: for rent £88,842 and for interest £111,493.

16. **General Statistics.**—The following table summarizes the allotments of agricultural holdings made during the twelve months ended the 31st March, 1924, and during the period from the 31st May, 1910. under the several statutes governing the disposal of land for settlement purposes :—

ALLOTMENT OF AGRICULTURAL HOLDINGS.

Statutes Governing Allotment.	1st April, 1923, to 31st March, 1924.				31st May, 1910, to 31st March, 1924.

* Includes reallotment of surrendered holdings, cancellations, etc.

17. **Boreholes and Windmills.**—Boreholes are sunk for Crown lessees, and in the case of deep boring windmills are erected.

§ 3. Registration of Deeds.

1. **Deeds Registries in the Cape of Good Hope.**—There are in the Cape Province four Deeds Registry Offices, situated at Cape Town, King William's Town, Kimberley, and Vryburg respectively.

Each Registry is in charge of an officer styled the Registrar of Deeds, and effects registration in respect of that portion of the Province specially allotted to it, as under :—

King William's Town	The Divisions of King William's Town, East London, Komgha, Stutterheim, and portions of the Divisions of Cathcart and Victoria East.
Kimberley	The Divisions of Kimberley, Barkly West, Herbert, and Hay.
Vryburg	The Divisions of Vryburg, Mafeking, Gordonia, Kuruman, and Taung.
Cape Town	The remaining divisions and districts, one hundred and two in number.

It is essential for the purposes of registration that all transfer deeds and mortgage bonds shall have been drawn or prepared by persons duly authorized by law so to do and be executed in the presence of the Registrar concerned. In the Cape Province advocates of the Supreme Court and conveyancers are so authorized. Other deeds are only registered if they have been executed in the presence of a notary public and attested by his signature.

The principal functions of the several Registrars of Deeds are the following :—

(*a*) To register grants or leases, by the Crown, of land.
(*b*) To examine, attest, and register deeds of transfer or hypothecation of land.
(*c*) To register cessions of mortgage bonds, or renunciations, or waivers, by the legal holders.
(*d*) To effect the necessary registration in connection with the cancellation of mortgage bonds, or part-payments, or releases therefrom.
(*e*) To register antenuptial contracts, general or special notarial bonds, notarial deeds of servitude and of donation, and other notarial deeds registrable by law.
(*f*) To register leases and cessions of leases of rights to minerals as defined by Act No. 31 of 1898, namely, gold, silver, and platinum.
(*g*) To register usufructs of land.
(*h*) To register notarial deeds of lease of land for ten years and upwards.
(*i*) To issue and register such certificates of title to land as may be prescribed by law.
(*j*) When so required by law, to satisfy themselves in connection with the registration of any deed—
  (1) that the duties, taxes, fees, dues, and quitrent (if any) payable to the Government or Provincial Administration have been paid ;
  (2) that rates or charges payable in respect of land to a local authority have been paid.
(*k*) Generally to exercise all such powers and discharge all such duties as are by statute and common law imposed upon them.

(i) *Deeds Registry at Cape Town.*—The Deeds Registry at Cape Town came into being in the year 1828 as a result of the promulgation of Ordinance No. 39 of 1828. Particulars of this enactment and historical details of earlier provision for the registration of bonds and obligations (e.g. the Debt Register established by a *Placaat* of 1714) are given in previous issues of this *Year Book*. Ordinance No. 27 of 1846 made registration in the Debt Register compulsory, Act No. 21 of 1875 provided for the registration of antenuptial contracts, and Act No. 43 of 1895 for the registration of debentures.

Of other measures relating, either wholly or in part, to the transfer of land the following may be mentioned : the *Titles Registration and Derelict Lands Act*, 1881, which, *inter alia*, provides machinery for obtaining transfer when land has been acquired by prescription, or when owing to some cause transfer cannot be obtained in the ordinary course ; the *Glen Grey Lands and Local Affairs Act*, 1894, which, in addition to other matters, provides for a simple and inexpensive form of transfer in regard to native allotments situate in the district of Glen Grey and any other native areas to which the Act may be applied.

The *Deeds Registry Act*, 1891 (No. 19), amended materially the law relating to the registration of deeds, and by regulations framed thereunder from time to time the practice of the Office was defined and modified on various points. The *Deeds Registry Act* was further amended in 1905 by the *Deeds Registry Amendment Act* (No. 39). With the exception of one section of each, these Acts have been repealed and superseded by the *Deeds Registries Act*, 1918 (No. 13), whereby the laws in force in the Union relating to the registration of deeds were consolidated and amended, and the prior legislative enactments affecting the Office were repealed wholly or in part. This Act has in turn been amended in certain respects by Act No. 15 of 1922.

By section 59 of the *Deeds Registries Act*, 1918, provision was made for the appointment of a Deeds Registries Regulations Board with power, subject to the approval of the Governor-General, to make, alter or rescind regulations on the subjects mentioned in section 60. Regulations framed by this Board came into effect on the 1st January, 1919 ; but were superseded by new regulations published under Government Notice No. 1630 of the 6th October, 1922, with effect from the 1st January, 1923.

In addition to the above enactments which directly affected or regulated the Office there are various other Acts and Ordinances imposing special duties upon the Registrar, among which may be mentioned the following :—

The Transfer Duty Act, 1884, requires the production of a receipt for transfer duty in connection with every transfer not expressly exempted ; Acts Nos. 16 of 1890, 23 of 1892, 30 of 1893, and 3 of 1905 were passed to facilitate the transfer of land mortgaged to Government under the *Crown Lands Disposal Act*, 1887 ; Act No. 3 of 1873 vests land transferred to particular trustees and office-bearers of companies and associations in the successors in office of such trustees and office-bearers ; *the Cape Municipal Ordinance*, 1912, the *Divisional Councils and Roads Ordinance*, 1917, the *Provincial Immovable Property Tax Ordinance*, 1918, and extensions thereof ; the *Village Management Boards Ordinance*, 1921, and the *Local Boards Ordinance*, 1921, *inter alia*, prohibit the transfer of land without the production of proof that the rates and taxes, as the case may be, have been paid. The Registrar is also charged by the *Companies Act*, 1892, with the registration of joint-stock companies and of the returns prescribed thereby, and by the *Special Partnerships' Limited*

Liability Act, 1861, with the registration of limited partnerships. Other less important Acts and Ordinances affecting the Registry also exist, such as the *Friendly Societies Act* No. 7 of 1882, whereby friendly societies were required to be registered therein. Although this Act was repealed by Act No. 5 of 1892, it still remains in force in respect of the societies registered in terms thereof which were not re-registered under the repealing Act.

Of the laws passed since Union imposing additional responsibilities upon Deeds Registries, mention may be made as follows: the *Stamp Duties and Fees Act*, 1911, and subsequent amendments; the *Dipping Tanks (Advances) Act*, 1911, and subsequent amendments; the *Irrigation and Conservation of Water Act*, 1912; the *Fencing Act*, 1912, and subsequent amendments; the *Land Bank Act*, 1912, and subsequent amendments; the *Land Settlement Act*, 1912, and subsequent amendments; the *Administration of Estates Act*, 1913; the *Insolvency Act*, 1916; the *Housing Act*, 1920; the *Provisions of Homes (Municipal) Ordinance*, 1920; the *Death Duties Act*, 1922, and the *Defence Endowment Property and Account Act*, 1922. By the *South-West Africa Affairs Act*, 1922, the records of the Registry relating to land at Walvis Bay were transferred to the Deeds Registry at Windhoek. By the *Co-operative Societies Act*, 1922, provision was made for the transfer of co-operative companies registered under the *Companies Act*, 1892, to the office of the Registrar of Co-operative Societies.

The following tables (*a*), (*b*), and (*c*), give particulars regarding all registrations effected during a series of years, and of the value of land transferred and mortgage bonds passed and cancelled, the amount of the nominal capital of joint-stock companies registered, and the revenue derived by way of fees and duty during the same period :—

DEEDS REGISTRY AT CAPE TOWN, 1919 TO 1924.

* Decrease attributed to prolonged drought and cessation of diamond-mining operations during the year.

(iv) *Deeds Registry at Vryburg.*—The appointment of a Registrar of Deeds at Vryburg was provided for by *British Bechuanaland Proclamation* No. 66 of 1889, and the system of registration of the Deeds Registry there established was maintained by Section 19 of the *British Bechuanaland Annexation Act*, 1895, for a period of five years. It now, however, depends for its existence and present system of registration on the *Deeds Registries Act*, 1918.

The following table gives the value of landed property transferred at the Registry at Vryburg during a series of years :—

LANDED PROPERTY TRANSFERRED, DEEDS REGISTRY, VRYBURG, 1912 TO 1924.

Year.	Value.	Year.	Value.
	£		£

1916	168,841	1923	161,243
1917	181,544	1924	225,419
1918	239,754		

2. **Deeds Registry in Natal.**—*The Deeds Registry Office* in Natal was created by Ordinance No. 2 of 1846, power being given to the Governor of Natal to appoint a Registrar of Deeds. In 1846 an amending Ordinance, No. 33, was passed. The first-named Ordinance defines the duties of the Registrar of Deeds and declares that the practice of the Deeds Registry Office at Cape Town should be that to be followed in the Natal Office. By Law No. 16, 1875, further detailed instructions as to the examination of certain deeds were laid down. A further Law, No. 19 of 1884, to amend the Law and practice of registration was passed, which provides for the promulgation of rules and deals with the registration of leases. Though the practice was founded on that of the Cape of Good Hope it differs therefrom, in minor respects, owing to the difficulty in the early days of ascertaining definite information on the subject and by reason of local legislation and decisions of the Natal Court. The Registry is now governed by the *Deeds Registries Act*, 1918.

Transfer duty is chargeable in respect of freehold property under Laws Nos. 5, 1860, and 19, 1883 (Natal), and Act No. 11, 1913, and in respect of leases under Law No. 19, 1884 (Natal) and Act No. 11, 1913.

Since the constitution of the Union, considerable changes have taken place in the work performed by the Natal Office. In 1911 the collection of transfer duty was undertaken by the Receiver of Revenue, Pietermaritzburg, and the issue of joint stock companies' and conveyancers' licences was transferred to the same office. In 1918 the registration of wills was transferred to the office of the Master of the Supreme Court, Pietermaritzburg, in terms of Act No. 24, 1913, and all wills proved and sealed wills between 1869 and 1913 were transferred to that office. In 1917, the registration of designs, copyrights in books, and works of art and play rights was transferred to Pretoria, together with all registers and records. Under Act No. 28 of 1922 co-operative societies ceased to be registered under Law No. 10 of 1864 and all existing societies had to re-register with the Registrar of Co-operative Societies within six months from the 14th August, 1922.

The following tables give the number of transactions entered at the Natal Deeds Registry, and the value of transfers, etc., passed during a series of years.

(i) **DEEDS REGISTRY, NATAL—TRANSACTIONS ENTERED, 1920 TO 1924.**

* No record.

3. **Deeds Registry in Transvaal.**—A Deeds Office for the South African Republic was established in Pretoria by Ordinance No. 3 of 1866. Prior to that Ordinance coming into operation deeds of transfer, bonds, and documents of a similar nature were signed and registered by the landdrosts of the various districts, but there was no central registry. The Ordinance was amended by Law No. 8 of 1880. A further amending Law, No. 5 of 1882, was enacted. That Law and certain other laws and *Volksraad Resolutions*, having reference to the Deeds Office and deeds and documents registered therein, were repealed by Proclamation No. 10 of 1902, which made new provisions regulating the Deeds Office and amended the laws relating to the registration of deeds. The Proclamation of 1902 was amended and amplified by Ordinance No. 65 of 1903, whilst the registration of prospecting contracts was dealt with by Ordinance No. 11 of 1904. The establishment of townships and the registration of lots therein were provided for by Act No. 33 of 1907 and amended by Act No. 34 of 1908. Act No. 25 of 1909 consolidated and amended the law regulating the Deeds Office and Mining Titles Registration Office and relating to the registration of deeds and mining titles. The final consolidating measure was the Union Act No. 13 of 1918 which is applicable to all the Provinces.

While Proclamation No. 8 of 1902 (the *Transfer Duty Proclamation*) had provided for the registration in the Deeds Office of lots in leasehold townships, Proclamation No. 35 of 1902 (amended by Ordinance No. 6 of 1902) established at Johannesburg an office for the registration, *inter alia*, of leases of lots in townships within the Mining District of Johannesburg (see below). Thus the Deeds Office, which had not included the registration of mining rights and stands, was precluded from registering leasehold lots in townships within the prescribed area. By the *Townships Amendment Act* of 1908, the freehold of lots in townships within the Mining Districts of Johannesburg, Boksburg, Germiston, and Krugersdorp became registrable either in the Deeds Office or in the Office of the Rand Townships Registrar, who is one and the same person as the Registrar of Mining Rights (now Registrar of Mining Titles). The Deeds and Mining Titles Offices were directed by the law to inform each other of transactions within the prescribed area, and thus a system of dual registration was established. Johannesburg obtained the convenience of local registration whilst the value of the Deeds Office was not impaired. Mortgage bonds upon such property, passed before the Rand Townships Registrar, which contain a "General Clause," are specially re-registered in the Deeds Office. The Deeds Office therefore at present contains a complete record of the ownership of all land and of all hypothecations or other encumbrances of such land, but it contains no record of leases of lots in townships within the mining district of Johannesburg, nor of mining titles (other than mijnpachts) nor stand titles issued under the Gold Law anywhere in the Province. Act No. 13 of 1918 is the principal law regulating the Deeds Office of the Transvaal. New regulations relative to the registration of titles and other deeds in the several Deeds Registries of the Union have been framed and came into force on the 1st January, 1923.

Various Acts, such as the *Irrigation Act*, the *Administration of Estates Act*, the *Land Bank Act*, *Fencing and Dipping Tank Acts*, and the *Insolvency Act*, impose duties upon the Registrar of Deeds or govern certain practices of his office.

The Registrar of Deeds has also, since 1904, been Registrar of Deeds for Swaziland.

A statement is appended showing the number of deeds registered, value of properties transferred, bonds passed, transfer duty and stamp duty in connection therewith, and fees of office for a series of years. Some of the figures are approximate only, and, moreover, it must be remembered that the figures as to transfers and bonds include certain transfers and bonds passed and bonds cancelled by the Rand Townships Registrar.

DEEDS REGISTERED IN TRANSVAAL, 1919 TO 1924.

(3) Amount of fees, 1924..... £14,755

* Increase largely explained by the fact that bonds for £10,461,222 represent additional security, and rearrangement of existing bonds by companies to trustees for debenture holders.
† Including collateral and surety bonds.

Mining Titles and Rand Townships Registration Offices, Johannesburg.—These offices form a branch of the Mines and Industries Department, and were originally established in Johannesburg by Proclamation No. 35 of 1902 under the name of "The Registration of Mining Rights Office." The office was created for the purpose of regularizing, and centralizing in Johannesburg, the registration of mining rights and stands granted under the laws dealing with the exploitation of precious stones, precious and base metals, and minerals in the Transvaal, and the registration of such leasehold stands or lots as were situated in the Mining District of Johannesburg, and also for the registration of transfers, mortgage bonds, and other transactions affecting such rights and stands.

Prior to that Proclamation the registration of mining rights and stands had been effected in the office of the Mining Commissioner of the mining district in which they were situated, the Transvaal at that period being divided into the Mining Districts of Johannesburg,

Heidelberg, Krugersdorp, Boksburg, Pietersburg, Barberton, Pilgrims Rest, Ottoshoop, and Pretoria. By Proclamation No. 14 of 1923, the Mining Districts of Johannesburg, Boksburg, and Krugersdorp were amalgamated and became known as the Johannesburg Mining District as and from the 1st February, 1923.

By the *Mining Titles Registration Act*, No. 29 of 1908, the Proclamation and the amending Ordinances Nos. 6 of 1902 and 6 of 1903 were repealed, saving, however, that its provisions, as amended, and the regulations thereunder continue in force in so far as they relate to matters connected with or incidental to these stands or leasehold lots in townships for which freehold title may be obtained under the *Townships Amendment Act*, No. 34 of 1908, *until such title is so obtained*. One of the effects of Act No. 29 of 1908 and the *Townships Amendment Act*, No. 34 of 1908, was to divide the "Registration of Mining Rights Office," formerly under the control of an officer styled the "Registrar of Mining Rights," into "The Mining Titles Registration Office" and "The Rand Townships Registration Office" under the control respectively of a Registrar of Mining Titles and a Rand Townships Registrar. Both posts are occupied by one and the same person as the duties are more or less inseparable.

Under the *Townships Amendment Act*, No. 34 of 1908, as amended by Act No. 30 of 1909, the work in the townships section of the office was considerably increased, chiefly as the result of those provisions relating to the conversion into freehold of stands or lots in Government, semi-Government, and privately owned leasehold townships, and the establishment of a system of dual registration in the Rand Townships Office and the Pretoria Deeds Registry of freehold lots in townships situate within the Mining Districts of Johannesburg, Boksburg, and Krugersdorp.

Practically 98 per cent. of the entire examination and registration of transactions affecting freehold lots is carried to completion in the Rand Townships Office, and it is incumbent on the Registrar to notify the Pretoria Registry of all such transactions.

Act No. 29 of 1908 came into force on the 1st January, 1909, the date of the commencement of the *Precious and Base Metals Act*, No. 35 of 1908, but it endured only until the 1st of September of that year, when it was partially repealed by Act No. 25 of 1909.

The expressed purpose of the latter Act was to consolidate and amend the law regulating the Deeds Office and Mining Titles Registration Office and relating to the registration of deeds and mining titles, but this Act, in part, was repealed by the *Deeds Registries Act*, No. 13 of 1918, which now governs the registration of deeds in all the Deeds Registries within the Union, subject to the following exceptions:—

(*a*) Deeds relating to stands or lots (until their conversion into freehold) situated in Government, semi-Government, and privately owned leasehold townships in the Mining Districts of Johannesburg, Boksburg, and Krugersdorp (now the Johannesburg Mining District), the registration of which is effected solely by the Rand Townships Registrar.

(*b*) Deeds relating to all mining titles, as defined in Act No. 25 of 1909, and the various rights granted under the laws dealing with the exploitation in the Transvaal Province of precious and base metals and minerals, the registration whereof is done by the Registrar of Mining Titles (see definition of "Deeds Registry" in Act No. 13 of 1918).

A statement is appended showing the number of deeds registered, the value of properties transferred, bonds passed, etc., and stamp duty and fees of office collected in connexion therewith by the Mining Titles and Rand Townships Registration Offices, Johannesburg, during each of the calendar years 1919 to 1924.

4. **Deeds Registry in Orange Free State.**—The records of the Orange Free State Deeds Office extend back to the early part of the year 1849, the period of the Orange River Sovereignty. The office was established by the British Resident at the time, and was administered according to the law of the Colony of the Cape of Good Hope. The first legislative enactment establishing a Deeds Office for the Orange Free State was Ordinance No. 5 of 1856, which was passed shortly after the reinstitution of Republican Government. This Ordinance was partly amended by Ordinances Nos. 16 of 1877 and 1 of 1888, and was finally superseded, on the codification of the laws of the State, by Chapter LVII of the Orange Free State Law Book. This was again repealed by Ordinance No. 33 of 1902, which was modified and supplemented by Ordinances Nos. 11 and 20 of 1904. The registration of antenuptial contracts was provided for by Law No. 7 of 1892. These enactments were wholly repealed by the Union *Deeds Registries Act*, No. 13 of 1918, which, with the regulations made thereunder and published in Government Notice No. 1500 of 1918, is now in force

The registration of companies was placed under the supervision of the Registrar of Deeds by Ordinance No. 5 of 1878, which was supplemented by Ordinance No. 9 of 1883. These Ordinances were subsequently superseded by Chapter C of the Orange Free State Law Book, which, amended and amplified by Ordinance No. 24 of 1904, remains the law of the Province. The liquidation of companies is governed by Law No. 2 of 1892, and the registration of insurance companies, which was formerly governed by Chapter CIII of the Law Book, is now regulated by the provisions of the *Insurance Act*, No. 37 of 1923. The registration of agricultural and other co-operative societies is controlled by Act No. 28 of 1922, which superseded the Orange Free State *Co-operative Agricultural Societies Act*, No. 1 of 1910.

By Chapter CXII of the Law Book, provision was made for the registration of Letters Patent in the Deeds Office. This law was repealed by Act No. 9 of 1916, under the provisions of which the registration of Letters Patent was transferred to the Union Patent Office, Pretoria.

By Chapter CXIII of the Law Book the registration of trade marks was placed under the Registrar of Deeds. This law, as amended by Law No. 13 of 1893, was repealed by Act No. 9 of 1916, under the provisions of which the registration of trade marks was transferred to the Trade Marks Office, Pretoria, and the records of the office relating to patents and trade marks were handed over to that office.

The subjoined tables show the number of deeds and other matters registered, the value of property transferred, the amounts of bonds passed and cancelled, and also the total amounts collected in connection with deeds and other matters registered during a series of years.

NOTE.—(1) Total amount of transfer duty, 1910 to 1924..... £1,072,925
(2) Amount of stamp duty levied on deeds registered, 1910 to 1924 £238,314*
(3) Amount of fees levied, 1910 to 1924..... £88,286†

5. **Scale of Fees.**—During its Session of 1918 the Union Parliament passed an Act to consolidate and amend the laws in force in the Union, relating to the registration of deeds, No. 13 of 1918, termed the *Deeds Registries Act*, 1918, the provisions of which and the regulations thereunder, came into operation on the 1st January, 1919.

By this Act a number of previous enactments in the several Provinces were repealed wholly or in part, and under the regulations a uniform practice as far as possible was provided for in all Provinces, together with (A) a uniform tariff of fees of office as well as (B) a uniform tariff of fees and charges of conveyancers and notaries public. Those regulations have now been superseded by new and amended rules, which were published under Government Notice No. 1630 of 1922. A copy of the revised tariffs was given in the sixth issue of this *Year Book*, to which reference should be made for information on this subject.

§ 4. Valuation of Property.—Cape of Good Hope.

1. **First Quinquennial Valuation.**—The subjoined table gives the result of the first complete quinquennial valuation of immovable property in the Cape of Good Hope Province (inclusive of the Transkeian Territories), undertaken in terms of Ordinance No. 7 of 1914 and *interim* general valuations framed under Ordinance No. 5 of 1922, and shows, by divisions, the number of properties, the site values, the values of buildings and beneficial improvements, the total valuation, and the rateable values in each case. The figures are corrected up to April, 1924. A *division* is defined by the Ordinance as a rural or divisional council area, including any municipality or village management board area therein, and where there is no rural or divisional council area, a magisterial district or such magisterial districts as may be combined for the purposes of the Ordinance by the Administrator. *Site values* are determined, according to a prescribed procedure, by the ordinary price which a buyer will be willing to give and a seller to accept if the land to be valued were brought at the time of valuation to voluntary sale. The basis of the valuation of *buildings* is the estimated cost of erection at the time of valuation, allowance being made for structural and other depreciation. By *beneficial improvements* are meant those " which increase the value of the land for agricultural purposes, and include structural works, dipping and storage tanks, kraals, fences, irrigation works, dams, boreholes, stables, etc., but not residential buildings."

* An amount of £1,713, being company capital duty and annual dues of foreign companies, has not been included in this amount.
† An amount of £32, being fees levied on companies as office fees, has not been included in this amount.

VALUATION OF IMMOVABLE PROPERTY, CAPE OF GOOD HOPE PROVINCE (INCLUDING TRANSKEIAN TERRITORIES).

CHAPTER XII.

IRRIGATION AND WATER CONSERVATION.

§ 1. Irrigation.

1. **Legislation.**—In the Cape of Good Hope no attempt was made to control questions of water conservation and irrigation until 1906, when an *Irrigation Act* was passed. This law was, however, mostly concerned with questions of administration, and the law of irrigation and water-rights was in the main controlled by the common law based upon the Roman-Dutch law. This had so complicated matters and had created so many vested rights that any drastic departure from common law became impossible. The principle of water conservation was entirely ignored, whereas in a country with large arid and semi-arid tracts this formed the most essential factor of a water law. Except in the Oudtshoorn district of the Cape Province, irrigation, until a few years ago, was a trifling affair, but during recent years irrigation development has taken place on a large scale in parts of the Cape Province having problems of totally different characters, and the old pioneer irrigation districts, such as Oudtshoorn, Worcester, and Stellenbosch, are being rapidly overtaken by other irrigated districts of the Province.

In the Transvaal an *Irrigation Act* was passed in 1908, but irrigation in this Province had not yet greatly developed. The position is similar in the Orange Free State, which contains, especially in its southern portions, considerable possibilities in respect of irrigable areas. The total absence of a water law has, however, hitherto greatly hampered development. Natal, owing to topographical, physical, and climatic conditions, differs somewhat from the other Provinces as regards irrigation, but none the less stood in need of a proper law, as, apart from irrigation, domestic water supplies and the development of water power had necessarily to be controlled.

Subsequent to the constitution of the Union it was not found possible to frame a law approximating even remotely to an ideal water law for the Union, as regard had obviously to be paid to the very large vested interests which had accrued throughout the Union during previous generations. All that could be done was to make the most of the old common law principles, which had controlled the situation previously. Furthermore, it was found that no water law could be framed which would work with mechanical precision and provide a clear and ready solution for every case which might arise. Owing to the conditions of the country water-legislation must of necessity be elastic to a full degree and its practical value necessarily depends on the efficiency of the administrative machinery created by legislation. The Union *Irrigation and Conservation of Waters Act* was passed in 1912. This Act provides first for a national law regulating the use of water in public streams. Further, it provides special judicial machinery, for dealing with the definition of water-rights along public streams, the settlement of disputes, the granting of servitudes and permits and other matters. It also contains a variety of provisions designed to promote the development of irrigation in the Union. In principle the Act is an effort to realize the following main objects :—

(*a*) Preservation, to the fullest extent possible, of all vested rights so far as they are of practical value to riparian owners.

(*b*) Provision for a rational and practical method of effecting an equitable distribution of water flowing in defined channels of a permanent character.

(*c*) Provision of equitable and practical means for the conservation and use of that portion of the flow in South African streams which cannot be immediately and beneficially used and may run to waste.

(*d*) Provision of machinery for bringing these objects into effect.

The subject-matter of the Act is as follows, giving an indication of the scope of the law :—

Chapter I. General control, including provision for hydrographic surveys, preparation of schemes, engineering services, water-boring.
II. Use of public and private water.
III. Use of subterranean water.
IV. Constitution of *Water Courts* and their jurisdiction, powers, and authorities.
V. Constitution of *River Districts* and *Boards*.
VI. Constitution of *Irrigation Districts* and *Boards*.
VII. Expropriation of land and acquisition of servitudes.
VIII. Irrigation loans to private persons and to *Irrigation Boards*.
IX. General and miscellaneous matters relating to right of entry upon land for irrigation purposes, service of notices and documents, exemption of irrigated lands from rates, offences and penalties, etc.

UNION OF SOUTH AFRICA

Seven sections of regulations have been framed under the law dealing with various matters in detail.

In November, 1923, a Committee, consisting of Mr. Justice van Zijl (Chairman), Water Court Judges Jeppe and Louwrens, and Mr. A. D. Lewis (Director of Irrigation), was appointed by the Government to inquire into and report upon any amendments necessary to the Irrigation Act of 1912, and particularly to sections 15 and 16 thereof, dealing with the construction of works for the storage or diversion of surplus water of public streams and the protection of such works. The report of the Committee was published in April, 1924.

In October, 1924, a Commission known as the Irrigation Finance Commission, consisting of Mr. A. P. J. Fourie, Mr. M. Gadd, Mr. J. Collie, and Mr. R. J. van Reenen, was appointed by Government to report upon (*a*) the financial position of irrigation works financed by Government moneys, (*b*) the measures of relief which might be necessary to place schemes on a sound financial footing; (*c*) the desirability of appointing a Permanent Irrigation Commission to administer and co-ordinate activities in connexion with irrigation schemes.

The Commission issued its first report in March, 1925 (U.G. 29–'25), its second in October (U.G. 44–'25), and is at the present time proceeding with its further investigations.

The following table gives a conspectus of existing Union legislation and regulations relating to irrigation :—

IRRIGATION AND WATER CONSERVATION—LEGISLATION, 1910 TO 1924.

Act.	Regulations.	
	Subject.	Government Notice or Proclamation.
The Irrigation and Conservation of Waters Act, No. 8 of 1912, as amended by Act No. 26 of 1916, Act No. 32 of 1917 (section 112), and Act No. 38 of 1922 (section 6) Water Court Judge Act, No. 2 of 1924	Irrigation and River Boards—	
	General	G.N. No. 1692 of 1912. G.N. No. 870 of 1917. G.N. No. 1271 of 1917.
	Manner in which accounts shall be kept	G.N. No. 458 of 1914.
	Irrigation Loans—	
	General	G.N. No. 1122 of 1912. G.N. No. 998 of 1912. G.N. No. 714 of 1916. G.N. No. 1160 of 1916.
	Overdrafts and short-dated ...	G.N. No. 1387 of 1915.
	Registration of Servitudes—	
	General	G.N. No. 987 of 1913. G.N. No. 603 of 1917.
	Water Courts—	
	Guidance of members in defining or fixing the reasonable use of the normal flow of a public stream by a riparian proprietor	G.N. No. 982 of 1912.
	Procedure	G.N. No. 459 of 1917. G.N. No. 1267 of 1917. G.N. No. 210 of 1918.
Land Settlement Act, No. 12 of 1912, as amended by Act No. 23 of 1917, Act No. 28 of 1920, and Act No. 21 of 1922	—	—
Irrigation Works (Special Loans) Act, No. 18 of 1917	—	—
Hartebeestpoort Irrigation Scheme (Crocodile River) Act, No. 32 of 1914, as amended by Act No. 32 of 1917 and Act No. 23 of 1918	General	G.N. No. 262 of 1922.
Hartebeestpoort Irrigation Scheme (Acquisition of Land) Act, No. 23 of 1918	—	—
Oliphants River Irrigation Works Act, No. 28 of 1917	Allotting of water	G.N. No. 294 of 1923.
Oliphants River (Van Rhynsdorp Canal) Act, No. 5 of 1912	—	—
Mapochs Gronden Water and Commonage Act, No. 40 of 1916	General	G.N. No. 896 of 1919.
Riparian Land (Erven and Commonages) Act, No. 11 of 1919	—	—
Financial Adjustments Act, No. 38 of 1922	—	—
Financial Adjustments Act, No. 35 of 1923	—	—

2. **Administration.**—(i) *Irrigation Department.*—The administration of the *Irrigation Act* is vested in an Irrigation Department under a Director of Irrigation with a staff of engineers and other administrative officers. The principal activities of the department may be summarized as follows :—

(*a*) A special branch of the department is engaged in the systematic collection and compilation of hydrographic data throughout the Union, the chief practical

results being the determination of the absolute run-off of surface drainage from a number of clearly defined typical catchment areas; the relation of such run-off to the rainfall over the catchment; the determination of the maximum intensity of run-off during storms; the gauging of permanent springs, etc.

(*b*) Closely allied to the hydrographic survey as regards the character of its investigations is the meteorological service of the Union, as to which particulars will be found in Chapter I of this *Year Book*.

(*c*) Systematic reconnaissance surveys, together with hydrographic statistics indicate where and how irrigation development can take place, and the carrying out of these surveys is a function of the department hardly less in importance than the collection of hydrographic data. Arising out of these reconnaissance surveys irrigation projects are elaborated; these are either laid before the riparian owners interested with the object of inducing them to form an irrigation district under the Act for the purpose of undertaking the scheme as a co-operative work financed under an irrigation loan, or the project is taken up, if circumstances are favourable, as a Government work and may be constructed by departmental agency.

(*d*) Government irrigation settlements are maintained and to a large extent administered by the Irrigation Department.

(*e*) An elaborate system exists under which bona fide farmers, irrigation boards, and river boards may obtain professional assistance from the department. Such services are charged for at prescribed fees.

An important section of the department is the water-boring branch, the work of which falls into the following main sections :—

(i) Boring for farmers in certain areas of the Union on a scale of charges more or less approximating to the actual cost to the department;

(ii) boring for water on vacant and waterless Crown lands to make such lands fit for settlement; and

(iii) boring for water at school sites, hospitals, gaols, and other similar public institutions.

(*g*) The department acts as the adviser of Provincial Administrations on all matters relating to water supply, drainage, sewerage, or irrigation within the areas controlled by municipalities and public bodies; and it advises and more or less controls irrigation and river boards.

(ii) *Water Courts.*—The Water Court is an institution which was in existence in the Cape for many years, and a similar court was created under the Transvaal Irrigation Act, No. 27 of 1908. In the Union Act the Water Court occupies a stronger and more important position than under the Cape or Transvaal law. A Water Court is constituted by an itinerant Water Court judge as president and two assessors, one of them a competent hydraulic engineer attached to the Irrigation Department, and the other a person selected from a number nominated by the Governor-General for each proclaimed Water Court District. The Union has been divided into twenty-two Water Court Districts for that purpose.

3. **Government Expenditure on Irrigation.**—Particulars are given hereunder as to (i) expenditure on the Department of Irrigation and (ii) irrigation loans for a series of years :—

* Cape of Good Hope only.
† 1st January, 1912, to 31st March, 1913.
‡ Financial Years from 1913–14.

4. **Water-boring.**—The following table gives particulars of boring operations undertaken in the Union since the year 1903–04, when the first boring branch was established in the Transvaal. Prior to the date of the constitution of the Union no figures are available for the other three Provinces. The total number of holes drilled by the department from 1904 to the 31st March, 1925, was 9,884, principally in the Transvaal, the reason being that boring operations were not actively carried out in that Province before 1904, whereas in the other Provinces boring branches had been in existence for many years and a great deal of work had already been done at that date. It is to be noted that the costs of boring for the periods given are not comparable, owing to the varying conditions applying to the different groups of operations.

* Records for other Provinces not available.

5. **Irrigation Districts.**—At the 31st March, 1925, 93 Irrigation Districts, controlled by Irrigation Boards, had been constituted. These districts and boards are constituted in terms of Chapter VI of the Union Irrigation Act for the purpose of carrying out and controlling co-operative irrigation schemes. Any three riparian owners can petition the Minister for an Irrigation District to be formed, and if, on inquiry, it is found that the owners of not less than two-thirds of the total irrigable area under the projected scheme are in favour of the constitution of this district, it may be constituted by the Governor-General-in-Council by proclamation. All the irrigable area in the district then becomes liable to rating by the board, and these rates are a preferent charge on the land, ranking prior to all other mortgages. An irrigation board can obtain irrigation loans from the Government or other sources on the security of its rates.

Most of the irrigation development in the Union has been done through the medium of Irrigation Boards, especially in the Cape Province.

Of the 93 Irrigation Boards established at 31st March, 1925, 66 were in the Cape Province, 22 in the Transvaal, and 5 in the Orange Free State. Of the proposed schemes 69 were completed, 3 were under construction, 16 were under investigation, and 5 were boards dormant for the time being. The cost of the completed schemes was £3,578,844, the rateable area being 143,906 morgen. Approximate figures for works under construction are £732,000, and rateable area 27,439 morgen.

The following table gives particulars regarding Irrigation Districts established in the Union on the 31st March, 1925. With the exception of those against which a mark of reference has been placed, all irrigation works contained in the table have been completed.

IRRIGATION DISTRICTS ESTABLISHED AT 31st MARCH, 1925.

Name and District.	Source of Water Supply.	Area to be Rated.	No. of Voters 31st March, 1925.	Cost of Works.	Average Cost per Morgen Irrigated.

6. **Important Irrigation Schemes.**—(i) *General.*—Since 1916 great progress has been made with irrigation based upon conservation schemes, and the following table embodies some of the more important of these. Some further particulars of certain of these works will be found in the succeeding paragraphs:—

STORAGE WORKS CONSTRUCTED, UNDER CONSTRUCTION, OR AUTHORIZED.

Name of Scheme and District.	Storage Capacity, million cubic feet.	Actual or Estimated Cost of Scheme.
CAPE PROVINCE.		£
Bellair; Ladismith and Swellendam	425	45,300
Blyde River; Pearston	81	29,500
Brandvlei; Swellendam, Robertson, Worcester, and Tulbagh	1,600	116,000
Calitzdorp; Oudtshoorn	205	168,053
Grass Ridge (Great Fish River); Cradock	2,757	170,000
Kamanassie; Calitzdorp and Oudtshoorn	1,355	660,000
Lake Mentz (Sundays River); Uitenhage and Jansenville	4,122	560,000

Kopjes; Vredefort	313	94,000

(ii) *Hartebeestpoort* (*Crocodile River*).—The dam is situated in a poort in the Magaliesberg Mountains, about 25 miles west of Pretoria on the Rustenburg road. The works were commenced in August, 1916, and consist of a concrete dam of constant-angle arch type, 460 feet long, 161 feet high above the river bed, and 193 feet above lowest foundation level. The area of the reservoir at full supply is 6½ square miles. The capacity of the dam is 123,255 acre feet, and the land irrigable totals 40,000 acres.

(iii) *Lake Mentz* (*Sundays River*).—The dam is situated 42 miles below Jansenville. The works were commenced in July, 1918, and consist of a concrete gravity section dam, 1,260 feet long, 94 feet high above the river bed, and 114 feet above lowest foundation level. The area of the reservoir at full supply is 7½ square miles. The capacity of the dam, which can be increased, is 94,000 acre feet. The area of the land rated by the Sundays River Irrigation Board is 38,000 acres.

(iv) *Kamanassie* (*Kamanassie River*).—The site of the dam is about 12 miles from Oudtshoorn. The works were commenced in June, 1919, and consist of a concrete gravity section dam, 1,265 feet long, 115 feet high above the river bed, and 145 feet above lowest foundation level. The area of the reservoir at full supply is 1¼ square miles. The capacity of the dam is 31,110 acre feet, though this can be raised. The area of the land rated by the Kamanassie Irrigation Board is 27,000 acres.

(v) *Tarka* (*Tarka River, Tributary of the Great Fish River*).—The dam is situated on the farm Tekenfontein, 18 miles north of Cradock. The works were commenced during 1921, and consist of a concrete gravity section dam, 1,640 feet long, 107 feet high above the river bed, and 124 feet above assumed lowest foundation level. The area of the reservoir at full supply is 3¼ square miles. The capacity of the dam is 58,000 acre feet, but provision is made for later increase. The area of the land rated by the Great Fish River Board is 35,000 acres.

(vi) *Grass Ridge* (*Great Brak River*).—The dam is situated on the Great Brak River, 9 miles above Fish River Station. The works were commenced during 1921, and consist of an earthen dam with a concrete core wall. It is 1,530 feet long, 80 feet high above the river bed, and 96 feet high above assumed lowest foundation level. The area of the reservoir at full supply is 5 square miles. The capacity of the dam is 63,272 acre feet. The area of the land rated by the Great Fish River Board is 20,000 acres.

(vii) *Van Ryneveld's Pass* (*Sundays River*).—The dam is situated immediately above Graaff-Reinet. The works were commenced in July, 1920, and consist of a concrete dam, 1,160 feet long, 106 feet high above the river bed, and 141 feet above lowest foundation level. The area of the reservoir at full supply is 4 square miles. The capacity of the dam is 64,000 acre feet; this can be increased. The area of the land rated by the Irrigation Board totals 22,000 acres. The scheme is nearing completion.

(viii) *Tygerpoort (Kaffir River).*—The dam is situated about 22 miles south of Bloemfontein. The works were commenced during the first quarter of 1922, and consist of an earthen dam with a reinforced concrete core wall. It is 395 feet long, 65 feet high above the river bed, and 95 feet above lowest foundation level. The area of the reservoir at full supply level is 4 square miles. The capacity of the dam is 30,000 acre feet. The area of the land rated by the Irrigation Board totals 4,800 acres.

§ 2. Conservation of Water.

1. **Waterworks and Storage in Municipal Areas.**—The following table gives particulars of the cost of installation, storage capacity, and consumption of the principal Municipal Waterworks in the Union for the year 1923–24:—

URBAN WATERWORKS, 1923–24.

TOWN.	Cost of Installation.	Maximum Storage Capacity (in Thousands of Gallons).	Maximum Working Capacity per diem (in Thousands of Gallons).	CONSUMPTION.	
				Annual (in Thousands of Gallons).	Average Daily (in Thousands of Gallons.)

* Supplies Benoni, Boksburg, Brakpan, Germiston, Johannesburg, Krugersdorp, Roodepoort-Maraisburg, and Springs.
† Particulars not available.

2. **City of Cape Town Waterworks.**—(i) *Before Unification.*—The waterworks system of the Peninsula in existence at the promulgation of the *City of Cape Town Unification Ordinance*, 28th July, 1913, consisted of the following:—

Cape Town—

(1) 1849–52. Reservoir No. 1, below De Waal Park: capacity 2,500,000 gallons; cost about £2,700.
(2) 1856–60. Reservoir No. 2: capacity 12,000,000 gallons; cost approximately £8,100.
(3) 1877–86. Molteno Reservoir: capacity 43,000,000 gallons; cost £98,000.
(4) 1891–97. Woodhead Tunnel and Reservoir: capacity 210,000,000 gallons; cost £150,000.
(5) 1898–1904. Hely-Hutchinson Reservoir: capacity 200,000,000 gallons; cost approximately £200,000.
(6) 1907–08. Kloof Nek Reservoir: capacity 3,000,000 gallons; cost about £25,000

Southern Suburbs—

(1) Albion and Kommetje Springs.
(2) Newlands Reservoir: capacity 30,000,000 gallons; cost £130,000.

Kalk Bay—

1900. Reservoir: capacity 22,000,000 gallons.

(ii) *Steenbras Water Scheme.*—Various schemes for the augmentation of the water supply were under consideration before unification, but the question was left in abeyance until the Ordinance came into force. In September, 1915, a Board of Engineers was appointed to examine and report upon (1) the extent to which the present and other sources of water supply within the Cape Peninsula could be developed; and (2) certain sources of water supply outside the Peninsula. The Board came to the conclusion that it would be necessary for Cape Town to go outside the limits of the Peninsula for an adequate supply of water, and, after further investigations, recommended that the Steenbras Scheme should be carried out at the earliest available opportunity.

On the 3rd May, 1917, the Steenbras Water Scheme was adopted by the Council, and in July a loan of £850,000 was authorized for carrying out the scheme to supply 5,000,000 gallons of water per day from the Steenbras Valley. Contracts for the works were signed in December of that year, but in 1919 the contractors found they were unable to complete the work as expeditiously as required, and the Council decided to take over the contracts and finish the work departmentally.

The Steenbras Valley is situated in the division of Caledon, 40 miles from Cape Town. The whole of the catchment area, 23½ square miles, together with the land on either side of the river to the sea, is owned either by the Government or the Council. The works consist of: (1) a wall built above the entrance to the gorge, to impound the waters of the two rivers, Kogel Berg and Steenbras, which unite a few hundred yards above the site of the dam; (2) a tunnel, 2,700 feet in length, through the Hottentots Holland range of mountains; and (3) a cast-iron pipe-line to Cape Town. The present reservoir is designed to hold 600,000,000 gallons of water, sufficient to balance 5,000,000 gallons per day, but the Steenbras Valley is capable of providing up to a daily supply of 20,000,000 gallons of water when required. Water is conveyed to Cape Town through the tunnel and a cast-iron pipe-line 40 miles in length, and was turned into the Lower Reservoirs on the 20th January, 1921. The scheme was officially inaugurated by H.R.H. Prince Arthur of Connaught on the 9th March, 1921.

In 1923 the Council decided to proceed with the enlargement of the Steenbras scheme. A Board of Engineers was appointed to examine and report fully as to the additional works required. The Board recommended—

(1) the extension of the existing dam by widening and raising it 40 feet so as to impound 6,000,000,000 gallons. The maximum depth of the water will then be 90 feet, and when the reservoir is full, the surface area will be about 827 acres;
(2) the construction of a new outlet tower;
(3) the provision of a 33 inch cement-lined steel wrapped pipe line to Newlands Reservoir, having a capacity of 10,000,000 gallons per diem.

The estimated cost of the above works is £1,090,000. The report was finally adopted in November, 1923, and it is anticipated that the additional supply will be available for the summer season of 1927–28.

(iii) *Statistics of Steenbras Scheme.*—The following are the main statistics of the scheme:—

Total length of pipe-line	40 miles.
Length of dam	900 feet.
Maximum depth of water behind dam	50 feet.
Maximum height of wall	62 feet.
Lowest draw-off level, 30 feet below top water-level and 1,060 feet above sea-level.	
Area of reservoir at top water-level	220 acres.
Top water-level of reservoir, height above sea-level	1,090 feet.
Capacity of reservoir when full	600,000,000 gallons.
Elevation of catchment area, over 1,000 feet above sea-level.	
Height of tunnel above sea-level	1,055 feet.
Length of tunnel	2,700 feet.
Cost (approximate)—	
Reservoir, tunnel, land and water rights, etc	£303,000.
Pipe-line	£871,000.
Total cost (capital expenditure)	£1,173,686.
Annual charges (including interest, sinking fund, and maintenance)	£70,479.
Annual amount spent on maintenance	£1,267.

3. **Rand Water Board.**—(i) *Constitution and Organization.*—In 1901 the Transvaal Government appointed the Witwatersrand Water Supply Commission to inquire into the available sources of water supply, with the object of formulating a scheme for the adequate supply of water to the local authorities and mines on the Witwatersrand, and to consider the constitution of a public body to carry out that scheme. As the result of the investigations of that Commission, the Rand Water Board was constituted, under Ordinance No. 32 of 1903 (Transvaal), to supply water in bulk to the municipalities, and in bulk and in retail

to the South African Railways and the gold-producing mines situated within the Board's "limits of supply," which include the magisterial districts of Johannesburg, Boksburg, Germiston, Krugersdorp, Benoni, and Springs. Further statutory powers were conferred upon the Board by Ordinances Nos. 48 of 1904, 30 of 1905, 21 of 1906, and Act No. 22 of 1909 (Transvaal); also by Union Acts Nos. 18 of 1914, 10 of 1920, 10 of 1921, and 18 of 1923.

The Board consists of 26 members, including the chairman, who is appointed by the Union Government. Twelve members represent the Transvaal Chamber of Mines; five the Johannesburg Municipality; the remaining eight being the representatives respectively, of the municipalities of Benoni, Boksburg, Brakpan, Germiston, Krugersdorp, Roodepoort-Maraisburg, and Springs, and of the Railway Administration.

Under the Ordinance of 1904, the water undertakings of the Johannesburg Waterworks Estate and Exploration Company, Limited, the Vierfontein Syndicate, Limited, and the Braamfontein Company, Limited, were transferred to and vested in the Board on the 31st March, 1905.

The total water supply available to the Board from the above-mentioned undertakings, at the 31st March, 1905, was about 2½ million gallons a day, barely sufficient to supply the domestic requirements of the inhabitants of Johannesburg and Germiston, and of the mines on the Central Rand. Almost the whole of this supply was drawn from boreholes and shafts sunk on the farm Zuurbekom, situated about 17½ miles to the south of Johannesburg. This source of supply, together with the plant and mains, was acquired by the Board from the Johannesburg Waterworks Estate and Exploration Company, Limited.

(ii) *Later Developments.*—During the course of the next few years, the Board developed a further underground water supply in the Klip River Valley, by means of boreholes sunk on its farm Zwartkopjes and on some of the upstream farms for a distance of about 5 miles from Zwartkopjes. Concurrently, the Board extended its distribution system east and west along the Rand. The supply from Zwartkopjes was brought into service in 1908, and for a time the supply available from this source and from Zuurbekom was sufficient to meet all requirements. The Zwartkopjes scheme, and the extension of the distribution system to the east and west of Johannesburg, was carried out by Mr. Donald Leitch, M.Inst.C.E., the Board's Chief Engineer. Mr. Leitch retired from the Board's service in 1910, and the late Mr. W. Ingham, M.Inst.C.E., M.I.Mech.E., was then appointed Chief Engineer to the Board. Immediately on assuming office, Mr. Ingham undertook the further development of the Zuurbekom supply, which he increased from 2·5 million gallons a day to 7·3 million gallons a day. On his recommendation, also, electrically driven pumps were installed at Zuurbekom, the necessary electric power being generated at and transmitted from the Central Pumping Station of Zwartkopjes, about 17 miles distant.

(iii) *Vaal River Barrage.*—In 1911, the demands of the Board's consumers had increased to such an extent that the Board instructed its Chief Engineer to investigate and report to it regarding the question of obtaining a large permanent water supply from a catchment area. As the result of the Chief Engineer's investigations, and on his recommendation, the Board, in September, 1913, adopted a scheme involving the construction of a barrage across the Vaal River at a point about 25 miles downstream of Vereeniging, to impound a quantity of water in the river-bed sufficient to yield a constant supply at the rate of 20 million gallons daily, and the installation of plant and mains to deliver a first instalment of 10 million gallons a day to the Rand. The necessary powers in this regard were obtained from the Union Parliament in June, 1914, but the outbreak of war a few months later rendered a commencement of the work impossible for some years.

Early in 1916, the Board decided to proceed with the construction of the barrage across the Vaal River. This work was commenced in July, 1916, and completed in October, 1922.

The works necessary to bring a supply of 5 million gallons a day to the Rand from the Vaal River were commenced in 1920, the Board having adopted the smaller unit in preference to the first instalment of 10 million gallons a day included in the original scheme approved by the Board in 1913. This first unit of 5 million gallons a day was completed and water therefrom was brought into service at the end of July, 1923. The question of proceeding with a second unit of 5 million gallons a day is still under consideration by the Board.

The works comprised in the Vaal River scheme include the barrage across the Vaal River at a point near Lindeques Drift, about 25 miles downstream of Vereeniging, consisting of thirty-six steel sluice gates 25 feet high and 30 feet in width, placed between concrete piers. When the storage resevoir thus created is full, the water is backed up for a distance of about 40 miles from the barrage, the contents of the reservoir being about 13,633 million gallons. Of this quantity, 1,560 million gallons is impounded for the use of the owners of land riparian to the reservoir area, in terms of section 3 (2) of Act No. 18 of 1914; and, after allowing for evaporation and absorption, and the quantity lying in the river bed below the level of the suction pipes at the River "Intake" pumping station, a balance of 7,300 million gallons is available for the use of the Board, being the equivalent

of a supply of 20 million gallons a day. The point of abstraction of the water from the reservoir is situated at Vereeniging, where pumping and purification plants have been erected to deal with the first instalment of 5 million gallons a day. After being rendered potable, the water is pumped from Vereeniging against a head of 480 feet to the Board's existing pumping station at Zwartkopjes. The water is then allowed to mingle with the underground water supplies collected at the Zwartkopjes Central Station, and the total available quantity pumped to the Board's service reservoirs at Forest Hill, Johannesburg (head 1,100 feet), and at Boksburg (head 820 feet), and from thence gravitated to the various points of supply.

(iv) *Statistics.*—Summarized particulars of the Board's water supply undertaking were given in *Official Year Book* No. 6. The following tables contain statistics of water supplied by the Board and the financial position of the latter :—

(i) WATER SUPPLIED TO CONSUMERS DURING THE YEAR ENDED 31st MARCH, 1925.

(In Million Gallons.)

Consumer.	Total Consumption.
Municipalities	1,991
Gold Mining Industry	1,849
South African Railways	459
Other Consumers	148
TOTAL	4,447

(ii) FINANCIAL POSITION—RAND WATER BOARD.

(*a*) Loan Account.

	£
Klip River Valley Scheme and General Distribution System	3,400,000
Vaal River Scheme	1,537,350
TOTAL	£4,937,350

(*b*) Revenue, Etc.

For the year ended 31st March, 1925, the revenue of the Board amounted to £478,485, and the expenditure to £477,485, the difference of £1,000 being transferred to the credit of the Fixed Charges Account. At the 31st March, 1925, the Reserve Fund stood at £68,526, the Renewals Fund at £130,493, and the Stock Redemption Fund at £1,930,217.

CHAPTER XIII.

AGRICULTURAL AND PASTORAL PRODUCTION.

§ 1. General.

1. Statistics of Production.—(a) *Introduction.*—A brief history of the development of agriculture in South Africa will be found in the sixth and earlier issues of this *Year Book*. More detailed statistics about this industry will be found in the Annual "Report on the Agricultural and Pastoral Production of the Union of South Africa."

The work of enumeration in connexion with the census is performed by the police organization. Information is furnished under the Statistics Act, which provides penalties for non-compliance, for failing to answer questions put by authorized officers, for refusing to permit authorized officers to enter upon any land, etc., for hindering or obstructing authorized officers, for giving wrong information, and, on the part of officers employed in collecting and handling the information, for divulging any facts relating to the affairs of an individual farmer.

(b) *Period covered by the Census.*—The first agricultural census was taken for the period July, 1917 to June, 1918. The second covered the ten months from July, 1918, to April, 1919. The next three dealt with the twelve months ending on 30th April of each year. The sixth census covered the period of sixteen months from May, 1922, to August, 1923. The annual agricultural census is now definitely taken for the year ending on 31st August.

(c) *Classification.*—The conduct annually of a complete agricultural census, including live stock in towns, is impossible on the ground of cost. In arranging for an agricultural census the following factors must be borne in mind :—

A.—Production in *Urban* areas. *B.*—Production in *Rural* areas by :
(1) Europeans.
(2) Asiatics and coloured persons.
(3) Natives on farms occupied by Europeans, Asiatics, and Coloured persons.
(4) Natives in reserves, locations, mission stations, and native farms.

A.—As far as production in *urban areas* is concerned, it has been decided to include all agriculture on plots one morgen in extent and over, the produce of which is grown for sale, and this is now included in the annual agricultural census. Further, the total number of live stock in urban areas belonging to Europeans is taken at the quinquennial census, and all live stock in urban areas at the decennial census of the total population, taken in the first year of each decade.

B.—As far as production in *rural areas* is concerned, the population census of 1904 provided figures in regard to Class B (1), (2), and (3) above, but not for each of the sub-groups separately. The agricultural and population censuses of 1911, 1918, and 1921 provided figures for all the sub-groups, but not separate details for (1), (2), and (3). The agricultural censuses of 1919, 1920, and 1922, provided details for (1), (2), and (3) as one group, but since 1923 Group (3) is being shown separately, and this information is now being collected annually. The figures of Sub-group (4) have been collected annually since 1923, and it is proposed to continue with this. Separate figures for all native production are therefore available since 1923.

Groups B (1) and (2) therefore will represent the most important series of agricultural statistics [see Table (i) below], but by adding the figures in Groups A (3) and (4) for the years in which they are available [see Table (ii) below] a total for all agricultural production (excluding live stock in urban areas, and production in urban holdings of less than one morgen) will be obtained.

Complete figures including all urban production will be available only in the first year of every decade, but as the urban native figures are relatively small, the five-yearly figures may be regarded as roughly comparable. As the total urban figures are relatively unimportant, the two main tables [(i) and (ii) below] will give a sufficiently accurate picture of the state of the agricultural industry of South Africa.

(i) FARMS AND AGRICULTURAL HOLDINGS OCCUPIED BY EUROPEANS, ASIATIC AND COLOURED PERSONS (INCLUDES THE STOCK AND PRODUCTION OF NATIVES RESIDING ON THESE FARMS, BUT EXCLUDES THE STOCK AND PRODUCTION OF NATIVES IN RESERVES, LOCATIONS, MISSION STATIONS, AND ON NATIVE FARMS).

2. **Union Department of Agriculture: Organization.**—Under the *South Africa Act* Parliament has the power itself to administer agricultural affairs or to delegate the whole or any part of the work to the Provinces. When the Union was established the Government decided to exercise that power itself. Accordingly a Minister of Agriculture was appointed for the Union, with a fully equipped Department of Agriculture.

The Department is organized on similar lines to those which characterized the late Transvaal Department, the latter having been modelled largely upon the Department of Agriculture of the United States of America. At the head of the Department is the Minister, who is responsible to Parliament for the policy and acts of the Department, and next in authority is the Secretary, who is the permanent head of the Department and Accounting Officer, and is responsible to the Minister for the work of the Department. The Secretary is assisted by an Under-Secretary.

The activities of the Department are maintained by a number of Divisions and Offices presided over by scientific and technical officers. The Secretary, Under-Secretary, and the Chiefs of the various Divisions and Offices are stationed at Pretoria, with the exception of the Viticulturist and the Superintendent of the Guano Islands, the former being established at Elsenburg and the latter at Cape Town.

The Divisions are as follows:—

(1) Veterinary.
(2) Veterinary Education and Research.
(3) Field and Animal Husbandry.
(4) Botany.
(5) Entomology.
(6) Chemistry.
(7) Extension.
(8) Agricultural Economics and Markets (including Co-operation Sub-Division).

In January, 1925, a reorganization of the Department of Agriculture took place, under which the Director of Animal and Field Husbandry assumed complete control of matters concerning sheep, wool, dairying, poultry, tobacco, cotton, viticulture, horticulture, agricultural schools, Government guano islands, etc. A Division of Economics and Markets was instituted and the Veterinary Division took over all work connected with dipping tanks. Under the Division of Extension, district agents or local extension officers were appointed to further the work of the Division, and generally the heads of Divisions were delegated with a greater measure of administrative control.

3. **Revenue and Expenditure.**—The following is a statement of the revenue and expenditure of the Department for the financial year April, 1923, to March, 1924.

DEPARTMENT OF AGRICULTURE—REVENUE AND EXPENDITURE, APRIL, 1923, TO MARCH, 1924.

* Transferred to South African Railways and Harbours Administration from 1st April, 1923.

4. **Veterinary Education and Research.***—(i) *Laboratories.*—The first bacteriological laboratory for veterinary purposes was founded in 1891 at Grahamstown by the Cape Colony Government. Six years later a laboratory was established by the Government of Natal at Pietermaritzburg, chiefly for the preparation of rinderpest serum. About the same time, and as a result of the rinderpest invasion, a laboratory was established by the late Republican Government of the Transvaal. After the South African war, this laboratory was taken over by the Public Health Department, chiefly for the preparation of rinderpest serum and of calf vaccine lymph. With the establishment of a Department of Agriculture in 1902, the station was transferred to the control of that Department, and from that time dates the real study of South African stock diseases. In July, 1906, the Transvaal Crown Colony Government set aside funds for the founding of a new laboratory. The present site at Onderstepoort was purchased, and in the following year when Responsible Government came into existence, wholehearted support was given to the project; building was rapidly pushed forward, and by the 1st October, 1908, the buildings were ready for occupation. With the Act of Union, the laboratories at Grahamstown and Pietermaritzburg were incorporated in the newly-formed Union Department of Agriculture, and as the laboratories at Onderstepoort were the most recent and up-to-date, the headquarters of the new Division were established there under the charge of Dr. Theiler, C.M.G. From the date of Union good progress was made; the nature of most of the diseases was cleared up, and methods were devised for the treatment of stock diseases. In 1914, as a recognition of the services rendered by Dr. Theiler, he was presented with the order of K.C.M.G.

Apart from the three main laboratories referred to (Pretoria, Pietermaritzburg, and Grahamstown), a permanent station has been established at Armoedsvlakte, near Vryburg, where investigation work is confined particularly to "lamsiekte" in cattle and to the general question of mineral deficiency. At Ermelo and also at Bester's Put, Petrus, O.F.S., stations have been established principally for the investigation of sheep diseases, and from time to time temporary camps are erected for field investigation. A laboratory which had been established in Zululand for investigation into the question of "nagana" in cattle was closed down in May, 1924, the immediate object of the station having been accomplished, and it being possible to carry on further work at headquarters.

(ii) *Veterinary Education.*—At the end of 1919 the Government decided to establish a School of Veterinary Science, and an agreement was arrived at for the Veterinary College to be an integral part of the Transvaal University College, the Director of Veterinary Education combining his duties with those of Director of the Institute. The Veterinary course is one of five years' duration, of which the first two years can be taken at a university college and the last three at Onderstepoort. The teaching staff is selected from the research officers of the institute, who thus hold dual positions, and can bring for the benefit of the students the results of investigations undertaken by them in their capacity of research officers.

(iii) *Staff and Functions of Division of Veterinary Education and Research.*—The staff of the Division consists of the Director of Veterinary Education and Research, sub-directors, research officers (some of whom also hold appointments in the University), with an administrative, clerical, and lay staff.

In addition to the educational duties of the Division, investigations are undertaken into the diseases of live stock with a view to discovering methods of diagnosing and suppressing them, and affording protection against their ravages. The Division also prepares sera and vaccines for the prevention of communicable diseases of stock, examines and reports on blood-smears and pathological and chemical specimens submitted by Government veterinary officers, farmers, and others. When requested, advice is given in all matters appertaining to stock, this being not the least important function of the Division. Opportunities are offered to visiting scientists and post-graduate students for carrying out special investigations.

The laboratory products issued by the Division comprise: Horse-sickness serum, for the prevention of horse-sickness in horses and mules; anthrax vaccine, for the prevention of anthrax in all classes of stock; redwater and gall-sickness vaccine, for the preventive inoculation of cattle against redwater and anaplasmosis (gall-sickness); contagious abortion vaccine, for use on cows in herds infected with the disease; black-quarter vaccine, for the prevention of black-quarter (or quarter-evil) in cattle and sheep; blue-tongue vaccine, for the prevention of blue-tongue (malarial catarrhal fever) in sheep; and wire-worm remedy, for the treatment of sheep infected with wire-worms.

Articles on stock diseases are published through the medium of the *Journal of the Department of Agriculture* for the information of the farming population, and a scientific report is published from time to time containing the results of the latest investigations undertaken by the Division.

---

* For further details of the Division of Veterinary Education and Research, reference should be made to the sixth and previous issues of this *Year Book*.

5. **Field and Animal Husbandry.**—The officer holding the post of chief of the combined Divisions of Field and Animal Husbandry is charged with the co-ordination of work of the sheep and wool section, dairy section, poultry section, tobacco and cotton, horticulture, viticulture, agricultural schools, guano islands, all matters relating to cultivation and agronomy generally, improvement of stock, fencing, and brands. In addition to these duties, he also undertakes the administrative charge of Agricultural Education.

6. **Division of Botany.**—The primary function of this Division is to undertake research with regard to :

(i) the botanical problems ;

(ii) the plant disease problems ;

(iii) fruit export.

(a) *Botanical Problems.*—The botanical problems include, first and foremost, a study of the vegetation of the country. For this purpose a Botanical Survey of South Africa has been organized. Its objects are to record geographical distribution of plants in the Union ; to obtain and correlate exact measurements of climatic factors which limit the distribution of species and bring about distinct plant formations or vegetative types in the Union ; to protect, develop, improve, and maintain the indigenous vegetation and to promote the full use of its resources by preventing soil erosion and overstocking. The research activities of the survey are supervised by the Director of Botanical Survey and four regional botanists, who, together with the Chief Conservator of Forests, the Director of Veterinary Education and Research, and the Senior Botanist in charge of the National Herbarium, form the Botanical Survey Committee.

Other botanical matters to which the Division devotes special attention are : (1) systematic work in economic botany ; (2) economic botany and indigenous plants ; (3) poisonous plants ; (4) drug plants ; (5) tannin and dye plants ; (6) fibre and paper plants ; (7) oil producing plants ; (8) native grasses ; (9) foreign seed and plant introduction work ; (10) seed testing ; (11) illustrated descriptions of South African plants.

(b) *Plant Disease Problems.*—This aspect of the work is dealt with by the mycological and phytopathological section of the Division, whose activities may be summarized as follows : (1) world plant disease survey ; (2) Union plant disease survey ; (3) advisory work ; (4) inspection work ; (5) general laboratory investigations.

(c) *Fruit Export Investigations.*—These investigations include problems relating to : (1) storage and shipment of citrus ; (2) storage and shipment of deciduous fruit and low temperature research ; (3) railage of fruit to ports at low temperatures.

7. **Division of Entomology.***—(i) *Organization of Division.*—Except that town councils under local government legislation have in some instances secured by-laws in connection with the keeping of bees, the suppression of noxious insects, and the employment of hydrocyanic acid gas as an insecticide within their respective municipalities, the Union Department of Agriculture is the Government body on which devolves the administration of all regulations in respect of insects, the investigation of insect problems, and all public matters pertaining to the suppression of pest insects. The Department divides its insect work between the Division of Entomology and its several agricultural schools. The entomologist at each school, aside from his teaching duties, is expected to give attention to insect queries that arise in the area served by the school, and to conduct insect investigations which can most conveniently be dealt with at his particular centre. The Division of Entomology has broader functions. In addition to conducting studies on economically important insects and disseminating information on the control of pest species by correspondence, publications, experiments, and demonstrations, it gives effect to the Union Government legislation concerning insects. The latter feature comprises measures for the suppression of locusts, for preventing the introduction of pests with imported plants, fruit, and apiary products, and for checking the dissemination of pests with traffic in plants and fruit within the country.

(ii) *Headquarters of Officers.*—The public is privileged to seek information on any injurious insect at the agricultural school, or office of the Division of Entomology, with which it is most convenient to communicate. Any inquiry sent to a school should be addressed to the Principal. The schools are located, respectively, at Elsenburg (P.O. Mulders Vlei, Cape) ; Grootfontein (P.O. Middelburg, Cape) ; Glen (Orange Free State) ; Cedara (Natal) ; and Potchefstroom (Transvaal). The central office of the Division is in Pretoria (P.O. Box 513). The addresses of branches are : P.O. Box 3, Cape Town ; P.O. Box 597, Port Elizabeth ; P.O. Box 16, East London ; and Botanic Garden, Durban. In each case the officer in charge may be addressed as " Government Entomologist."

* A more detailed account of the functions and work of the Division will be found in the sixth and previous issues of this *Year Book*.

A post office regulation requires that postage be paid on any letter of inquiry and on any parcel of specimens that may be sent by one of the general public to a Government officer for report, if the object in view is to secure information for private advantage. Donations of specimens may, however, be sent without postage to the Division of Entomology (and to various other Government institutions) when labelled "O.H.M.S.," and described as "Natural History Specimens" on the wrapper; and it is accepted that letters and specimens may also be sent to Government Entomological officers "O.H.M.S." without postage when the object is purely for the public good, and not a private interest.

(iii) *Plant Import Regulations.*—The introduction of plants from oversea, and also from African territories other than Southern Rhodesia, is allowed only under special permission given at the discretion of the Department. Certain kinds of plants are absolutely prohibited, and, in general, only ten plants of any woody kind are admitted for any one person. The introduction of peach stones is prohibited, and the introduction of chestnuts and acorns, lucerne, cotton, maize, and barley seed is allowed only in small quantities and under conditions. The introduction of broom-corn and raw cotton seed is also drastically restricted. Plants on which any insect or disease is found are liable to exclusion, and all woody plants are fumigated with poisonous gas as a matter of routine. These various precautions are designed to minimize the risk of introducing new pests. Bulbs, and seeds other than the aforementioned kinds, are admitted at present without special permission. Any person who desires to introduce plants should, before he places his order, apply to the Division for a permit for their admission, giving their varietal names and the number of each kind, and stating who is to supply them, where they will be grown, and how they will come. Many nurserymen now refuse to consign plants to South Africa unless they are assured that a permit for them has been or will be issued.

(iv) *Fruit and Potato Import Regulations.*—Fruit is admitted without the formality of a special permit, but is subject to inspection and to treatment, or even to exclusion, should it be found diseased or infested with insects considered pestiferous. The introduction of peaches, plums, cherries, and other stone fruits is prohibited.

Prospective importers of potatoes are advised to obtain from the Division particulars of documents required from the country of origin, as consignments are not admitted until prescribed certificates are produced. The regulations concerning oversea fruit and potatoes apply also to the produce of African territories other than Southern Rhodesia.

(v) *Bee Import Regulations*—The right to introduce bees and used apiary appliances is strictly reserved to the Government, and none have been imported since the constitution of the Union. The introduction of honey is absolutely prohibited; while the introduction of foundation comb and of beeswax is allowed only under special permit. The Government has wide powers, not at present exercised, in respect of the keeping of bees and of measures for the eradication or suppression of bee diseases.

(vi) *Nursery Regulations.*—On the assumption that plants from nurseries are the most serious potential disseminators of certain classes of insect pests and plant diseases, the registration of plant nurseries is required, and such places are quarantined should the conditions appear to warrant this drastic action. Every nurseryman who sells fruit trees is compelled to have a cyanide fumigation chamber fulfilling specified requirements, and the fumigation of every fruit tree therein before it is allowed to leave the nursery is obligatory upon him. The registration of carnation nurseries, and of vine nurseries within, and confining their business to, the main viticultural area of the Cape Province, is not necessary, but any person who grows other kinds of perennial plants for sale is required to effect registration.

(vii) *Plant Removal Regulations.*—The requirements in connection with nursery stock are supplemented by requirements in respect of plants that are sent by rail or post by persons who are not nurserymen. The inclusion of any plant in a parcel must be divulged on the label or consignment note, and railway and postal officials are under instructions to see that consignments of plants with certain exceptions go to a plant inspector at the sender's expense for examination. The inspector may return diseased plants to the sender and fruit trees are fumigated whether apparently free of pests or not. A fumigation fee of 2s. 6d. or more is charged.

The removal of vines into the Graaff-Reinet district, and also into a large area comprising the main viticultural districts in the south-west of the Cape Province, is strictly prohibited. The removal of mango trees into Swaziland without the express permission of the Swaziland Government is also prohibited. Because of citrus canker, the removal of any citrus trees from a limited section of the Transvaal lying to the north and west of Pretoria, is forbidden; and the planting of any citrus tree, and even the growing of any citrus seedlings, within the same area, is illegal unless special authority is obtained from the Secretary for Agriculture. Owing to the danger of spreading *Pernicious* (San José) *Scale*, the special permission of the Department is also required for the removal of most kinds of plants from the Transvaal, Orange Free State, or Natal to the Cape.

(viii) *Orchard Insects.*—The important orchard pests of the Union are chiefly a limited number that are practically cosmopolitan in countries comparable in climate. On the whole the orchard pests in the Union are no worse than, if as severe as, they are in most other countries. Those of California, for instance, may safely be said to be much more numerous and more potentially dangerous; but California has a temporary advantage in that its closer settlement and far more advanced industrial conditions simplify the problem of combating pests by spraying and fumigation.

8. **Locust Administration.***—The law providing for the destruction of locusts was formerly administered by the Division of Entomology, but as that Division was unable without seriously neglecting its primary functions, to devote sufficient time to the eradication of the pest, a separate branch of the Department of Agriculture was formed and an officer, styled "Officer in Charge of Locust Administration" appointed. The Locust Law (Act No. 11 of 1911 as amended by Act No. 12 of 1922) makes it compulsory for persons to report any egg-laying that takes place on land occupied by them and to destroy any *voetgangers* that hatch out thereon. In the event of any person failing to do so, the Government carries out the work at his expense. Government assistance is granted in special cases in which persons, in spite of doing their utmost with the resources at their disposal, are unable to overcome the *voetgangers* before they reach the winged stage. The Government provides poison free of charge and issues pumps on loan. It is not possible to legislate effectively for the destruction of flying locusts, but every assistance is given and every effort made to encourage the farmers to co-operate with one another and destroy flying swarms at night-time. With a view to ensuring the adoption of a uniform policy throughout South Africa and consequent better control of the pest, arrangements were made with the Bechuanaland Protectorate and South-West Africa for the Union Locust Law to be applied in these two territories, and for the operations against the locusts therein to be controlled by the Union Officer in Charge of Locust Administration.

9. **Division of Chemistry.**—(i) *Organization of Division.*—The Division of Chemistry is charged with the performance of all the chemical work necessary for the purposes of the Union Government, whether routine or investigational in character, with the exception of that required by the Division of Veterinary Education and Research, which has its own chemical staff at Onderstepoort. In order to carry out this work, the Division of Chemistry has, under its full control and direct supervision, chemical laboratories at Cape Town, Johannesburg, and Pretoria. Chemical laboratories are also attached to the other schools of agriculture, and carry out whatever chemical work may be required by the respective schools in the course of their teaching and extension work. These laboratories are, for administrative purposes, under the schools which they serve, but their investigational and research work is co-ordinated and controlled by the Chief of the Division of Chemistry.

Of the eight laboratories, the only institution which undertakes chemical work of all kinds is that at Cape Town. The laboratory at Pretoria, and the five attached to the several schools of agriculture, confine their operations to purely agricultural chemical work; while the Johannesburg laboratory, with a single exception (that of wines and spirituous liquors), performs exclusively non-agricultural work.

(ii) *Food and Drugs Acts.*—Of the different kinds of work undertaken by the Division in its own laboratories, the most voluminous is that under the Cape *Food and Drugs Act* and the analogous laws of the other Provinces. The administration of these laws is under the control of the Department of Public Health, and the carrying out of this control is of a twofold character; at the various ports it is exercised, in regard to articles of food imported into the country, through the Customs officials; within the towns and districts of the Union it is performed by means of inspectors. In either case the samples are detained (by the Customs), purchased (by the inspectors), or seized (in cases where sale is refused) and submitted, for analysis, to the officers in charge of the laboratories at Johannesburg or Cape Town, as the case may be. The Cape Town laboratory is charged with the analysis of food and drug samples in the south-western part of the Union, the eastern and northern areas of the Union being assigned to the laboratory at Johannesburg. The Division of Chemistry has been charged with the analytical work under the Food and Drugs Laws only since 1st May, 1923, previous to which date the administration, as well as the technical operations, were carried out by the Public Health Department. The practice now is for the Division of Chemistry to report its findings to the Health Department, which thereupon institutes legal proceedings where necessary.

During the twelve months ended 31st December, 1924, this class of analyses performed numbered about 3,400, comprising over 1,800 in the Cape Town and over 1,500 in the Johannesburg laboratory.

* In order to further the investigations into the locust problem, an expedition, under the direction of the Under-Secretary for Agriculture (Col. G. N. Williams), was dispatched in July, 1924, through the Kalahari desert to South-West Africa to study the question *in loco*.

(iii) *Fertilizer Control.—The Fertilizers, Farm Foods, Seeds and Pest Remedies Act* is administered by the Department of Agriculture, and the analytical work in respect of fertilizers and farm foods is carried on almost entirely in the chemical laboratories at Cape Town and Cedara. The method of operation is very similar to that employed in respect of foods. A great portion of the fertilizers used by farmers comes from overseas,* and every consignment that arrives is sampled by the Customs officials at the respective ports, and a sample sent either to the Cape Town or to the Cedara laboratory. Furthermore, an inspector is employed for the purpose of travelling about the country and purchasing (or seizing) for analysis samples of fertilizers offered for sale at the various towns and villages throughout the country. A third method of control rests with the farmers themselves, but is unfortunately, scarcely ever made use of. Although analyses of fertilizers are principally carried out in the Cape Town and Cedara laboratories, chemists officially appointed to undertake work under the Fertilizers Act are also stationed at the divisional laboratory, Pretoria, and at the school laboratories at Elsenburg, Glen, Grootfontein, and Potchefstroom, and any farmer who is doubtful regarding the composition of any fertilizer delivered to him is at liberty to have such fertilizer analysed in the nearest laboratory if he complies with certain conditions.

Every one who sells a fertilizer must give or send the purchaser, *without any delay whatever*, an invoice stating the quantity sold, the name or brand of the fertilizer and its guaranteed composition. Farmers who do not receive such an invoice along with the fertilizer are invited to bring the facts to the notice of the Department. No fertilizer is allowed to be sold unless it has first been registered, and this registration must be renewed year by year. Registration does not take place until the completed form has been passed by the Division of Chemistry.

Apart from statutory work on fertilizers, all consignments of guano arriving from the Government Islands are regularly analyzed in the Cape Town laboratory, and at several of the laboratories plot experiments are being carried on in relation to the effect of phosphatic rock fertilizers on crops, and in others on the reversion of phosphatic fertilizers in certain types of soil.

(iv) *Wine, Spirits and Vinegar Act.*—The administration of this Act, like that of the Fertilizers Act, is under the control of the Department of Agriculture. The method of exercising that control, by means of the Customs at the ports and a travelling inspector within the Union, is also analogous. The chemical work under the Act is divided between the Cape Town and Johannesburg laboratories. During the twelve months ended 31st December, 1924, 638 samples were examined under the provisions of this Act (528 in Johannesburg and 110 in Cape Town); approximately 10 per cent. of these were found to have been adulterated.

(v) *The Adulterated Leather Act.*—This statute, which took effect from 30th June, 1924, prohibits the importation into or manufacture within the Union of leather containing barium or lead compounds or excessive quantities of glucose or mineral substances. The Act is operated very much upon the lines of the others referred to above, by means of the various Customs offices and local inspection, the administration in this case being vested in the Department of Mines and Industries. The operations of the Act, in so far as they concern imported leather, have to some extent been anticipated for several years past by a regular submission of samples of imported leathers to the laboratories at Cape Town and Johannesburg. During the twelve months ended 30th June, 1925, 422 such leathers were examined in order to ascertain to what extent they complied with the provisions of the Customs tariff.

(vi) *The Dairy Industry Act.*—Under this statute occasional analyses of milk, butter, and cheese are carried out, the Food and Drugs Adulteration Laws requiring a much larger share of the Division's services in respect of such articles. Considerably more time is, however, taken up in testing the accuracy of milk-and-cream test bottles, large numbers of which are imported and sold to co-operative societies and creameries.

(vii) *Customs and Excise Work.*—This branch of work, too, is divided between the Cape Town and Johannesburg laboratories, and may be grouped under two heads, viz., analytical control and tariff classification. The number of articles examined during the twelve months ended 30th June, 1925, exceeded 1,400 (inclusive of leathers). The Excise section of the work comprises usually the testing of a large variety of alcoholic fruit and other essences, and toilet and medicinal preparations, with a view to ascertaining the proportion of alcohol that they contain, and whether the composition of the article remains true to its registered formula. The Customs section consists of the examination of numerous articles of miscellaneous character for tariff classification purposes, such as paints, road materials, oils, carbide, metals, lubricants, etc.

* Before the war the annual import of superphosphates exceeded 40,000 tons.

(viii) *Toxicological and Forensic Work.*—This, as a rule, emanates from the Department of Justice, and embraces all poisoning cases, both fatal and otherwise, whether intentional or accidental, which come within that Department's cognizance. The work is confined to the laboratories at Cape Town and Johannesburg. In many cases the chemical investigation of some poisonous plant has been undertaken for the first time as a result of the prosecution of a Kaffir "medicine man" for culpable homicide, but there are also numerous cases every year in which the poison has been such a well-known substance as arsenic or strychnine. The forensic or chemico-legal work of the Division of Chemistry also includes analyses under the law relating to habit-forming drugs, as well as work connected with the operation of the liquor laws, and such other chemical investigations as the Department of Justice may need—for example, the analyses of counterfeit coin, and the detection of forged writings or problems relating to the illicit buying of gold.

(ix) *Municipal Work.*—A considerable amount of chemical work is carried out in the Cape Town and Johannesburg laboratories for local authorities. The municipalities of the two cities in which these laboratories are respectively situated naturally contribute the largest proportions, but many smaller local authorities add to the total, which for the period January, 1921, to April, 1923, amounted to 2,351 samples.

(x) *Analyses of Water.*—Numerous analyses of water are continually being carried out, in order to test its suitability (1) for drinking and cooking purposes, (2) for engine boilers, and (3) for agricultural or irrigation purposes. Services in this direction are performed for Provincial Administrations and the Administrations of Swaziland and Basutoland, for the Railway and Postal Departments, for local authorities, for medical practitioners, and in certain circumstances for private individuals. In addition, special water-supply investigations occasionally call for the attention of the Division.

(xi) *Soil Investigations.*—After many years the Agricultural Soil Survey of the Union has begun. The duty of organizing and directing it falls to the Senior Chemist in charge of the Pretoria laboratory, who formerly was stationed at Grootfontein. The staffs of all the laboratories (excepting that of the Johannesburg laboratory, where no agricultural work is done) are aiding in the survey, an arrangement which is calculated to ensure a maximum utilization of local knowledge. The work is one of many phases and not merely, as is often supposed, the taking and analysing of samples of soil: it involves a close study of agricultural practice and the correlation of this with soil and climatic conditions and the soil itself is investigated physically, chemically, and biologically. The Divisional laboratories proper, i.e. those at Pretoria and Cape Town, are not able to devote much time to the soil problems of individuals or to undertake analyses for farmers. Such work is done for them by the chemical staffs of the agricultural schools at Elsenburg, Potchefstroom, Cedara Grootfontein, and Glen.

Soil work at the various laboratories may be classed as (*a*) farmers' analyses, which are undertaken at the agricultural school laboratories, (*b*) soil survey work, and (*c*) soil investigations and research other than soil survey work, which are mainly carried on in the Cape Town and Pretoria laboratories. In some laboratories, such as that at Pretoria, numerous soil data have been accumulated over a number of years: these are in process of being worked up and published in the form of bulletins of the Division of Chemistry. In other laboratories (e.g. Cape Town and Potchefstroom) problems relating to inoculation of the soil with different varieties of bacteria are being experimented with. Some of the laboratories (Grootfontein and Pretoria, for instance) are studying new methods for the mechanical analyses of soil, and wherever occasion arises inspections are made of localities where peculiar soil questions manifest themselves.

(xii) *Mineral Work.*—The subject of the genesis of soils by the disintegration of rocks is one which must necessarily be studied in any comprehensive scheme of agricultural soil survey, and accordingly a special study of this subject is being carried out in the Grootfontein laboratory, although for the present the investigation is still almost wholly local in its scope. In a more comprehensive way the Division is co-operating with the Department of Mines in seeking to gain detailed information regarding the Union's mineral resources. In the Transvaal the necessary chemical work is, under contract, referred to a private firm of analytical chemists in Johannesburg, but in the Cape Province the *Mineral Law Amendment Act* of 1907 affords facilities for prospectors and other interested persons to submit mineral specimens to the Cape Town laboratory of the Division of Chemistry for report.

(xiii) *Tanning and Dyeing Investigations.*—The work of investigating the Union's tanning and dyeing resources has been located at the Cedara laboratory. This investigation is being carried out in co-operation with the Forest Department. The by-products of the tanning industry are also being studied; particularly the destructive distillation of wattle wood for the preparation of charcoal and other by-products.

(xiv) *Fruit Investigations.*—Various phases of citrus fruit culture are being investigated by the Division in their chemical relationships. The study of the citrus soils in the Barberton area is being proceeded with by the chemical section at Potchefstroom School of Agriculture. The effect of arsenical sprays on the composition and flavour of citrus fruits has been under investigation in the Cape Town laboratory, and a study is being carried on season by season of different varieties of citrus fruit, from various parts of the Union during their passage from the immature to the ripe condition. The problems involved include the relation of soil, climate, variety, stock, and treatment to composition. In regard to the ripening process of grapes similar investigations are in progress in the Cape Town laboratory with a view to ascertaining the changes in sugar-content, acidity, etc., as the berries mature. This work is to be pursued from year to year in connexion with several varieties of grapes, and will also be extended to include investigations into the composition of raisins. The culture of pineapples is being similarly investigated in the Pretoria laboratory. The effect of soil conditions on the vitality of the pineapple crop, the changes that the fruit undergoes on maturing, and the effects of canning on the fruit have all been partially studied, and the study is being continued. The increasing export of dried fruit from the Union has made it necessary to investigate the sulphur-content of the fruit prior to shipment, lest regulations of the countries of destination should be contravened. The laboratory at Elsenburg has been charged with this work.

(xv) *Analyses of Fodder Plants.*—The fodder plants in the Union, introduced as well as indigenous, in actual use as well as potential, form the subject of standing investigation. This work is very extensive as far as the types of plants examined are concerned, and very widespread in its area. In connexion with cultivated crops, several points are being investigated in the different laboratories, particularly relating to the effects of special fertilizers on the composition of the grain at Elsenburg and on the composition of legumes at Cedara. In the latter, also, a series of investigations into the composition of indigenous grasses is being continued from year to year. In the Potchefstroom laboratory the chemical composition of white and yellow maize and their comparative effects in feeding pigs and poultry is under investigation.

(xvi) *Plant Pharmacology.*—Allusion has been made above to the fact that in the native territories "Kaffir doctors" or "medicine men" charged with culpable homicide are frequently the means of bringing to light the potentialities of indigenous plants containing active principles. Such plants are made the subject of chemical examination by the Division when opportunity arises.

(xvii) *Drought Problems.*—The Senior Chemist of the Division at Pretoria was a member of the Drought Commission. Out of the work done by him in that capacity have arisen extensive investigations relating to the possibilities of tiding stock over periods of drought. Experiments in this direction have been carried out not only on sheep, but also on oxen and cows in milk. The feeding of farm stock with plants which have hitherto been looked upon as worthless and even as noxious has been carefully studied, and important results have followed. Two plants have had special attention in this connexion, namely, prickly pear (*Opuntia*) and American agave (*Agave americana*). The former has been shown to be a valuable drought fodder, capable, unaided, of keeping sheep alive for over eight months. It has also been shown that sheep need no water whatever if they get prickly pear in abundance. As a general purposes fodder prickly pear has been shown to be of the same order as turnips and mangels: it is an excellent fodder for milk production when fed in conjunction with lucerne hay. The American aloe has also been proved an excellent drought and general purposes fodder, but when fed alone to cows in milk it appears to lead to their early death.

(xviii) *Tobacco and Cotton.*—The chemical investigation of tobacco in regard to its nicotine-content was undertaken in the Cape Town laboratory a few years ago, and is now being continued in the laboratory at Potchefstroom. The Cape Town investigations comprised principally a study of the increase of nicotine in a special variety of the tobacco plant (*Nicotiana rustica*) during its period of growth, the percentage of nicotine therein being found to be far in excess of that in ordinary tobacco, a matter of high importance in the utilization of tobacco dust against insect pests and the preparation of tobacco extract. A more detailed investigation of cognate problems is being carried on at Potchefstroom, commencing with an inspection of the tobacco and cotton soils in the Rustenburg District, and including not only investigation of the nicotine-content of tobacco under various conditions and at successive stages, but also a more complete analysis of the tobacco plant and of its mineral constituents, as well as a study of the functions of nicotine in the plant itself.

In relation to cotton, a detailed study of cotton soils is being entered upon, and fertilizing experiments are being undertaken in several parts of the country under the direction of a Committee appointed in connexion with the activities of the British Empire Cotton Growing Corporation.

(xix) *Problems Relating to Stock Dipping.*—The dipping of stock occupies a somewhat special position along the East coast, and hence receives more attention in the Cedara laboratory than in any other similar institution in the Union. For this reason, too, an investigation of the principles underlying the oxidization of arsenic in dipping tanks has been continued in that laboratory for some years. Cases of arsenical poisoning amongst stock also occur more frequently in those parts than elsewhere, and the investigation thereof calls accordingly for more constant attention there than in other laboratories. On account of the risks involved and the repeated losses of stock sustained, the colouring of white arsenicals used in stock dipping is now prescribed by regulation.

(xx) *Health Work.*—To a certain extent this phase of the Division's work has already been outlined above, but there are other aspects of it which have still to be mentioned. For example, for some years past the Cape Town laboratory has been engaged on the preparation of ethyl esters of chaulmoogra oil, which are continually being needed by the Public Health Department for the treatment of leprosy. The chaulmoogra oil is collected in India, and is imported for this special purpose.

(xxi) *Phosphates.*—In view of the need of phosphatic fertilizers in South Africa, and the great advantage that would accrue from the establishment of a successful phosphatic industry in the country, investigations are now in progress to test the suitability of local deposits.

(xxii) *Research.*—Many problems involving agricultural chemical investigation and research are continually arising. These investigations comprise such subjects of study as the development of nitrates in certain farm soils, the formation of prussic acid in cyanogenetic plants, the absorption of mineral salts by plants, the conservation of soil moisture, the properties of clay, infertility of sub-soils, and numerous others. Every laboratory of the Department has some of these problems under investigation.

(xxiii) *Publications.*—Much of the work performed in the chemical laboratories of the Department is published in bulletin form. This irregular publication was organized a few years ago as the "Division of Chemistry Series," of which some five dozen issues have now appeared. These deal with practically all phases of work performed in the chemical laboratories, including soils, fertilizers, stock dipping, oils and fats, fodders, plant poisons, wines, grapes, tobacco, etc.

(xxiv) *Consultation Work, etc.*—Officers of the Division in various parts of the Union are often deputed to act on commissions or committees of various Departments of State, amongst the more recent being the Drought Commission, the Oil Fuel Commission, and the Committee for Purchase of Government Supplies. Reports are also furnished from time to time on various general questions, and a considerable amount of time is devoted practically every day to consultations with other officials, as well as with farmers, prospectors, and other persons seeking advice.

10. **Division of Extension.**—The establishment of this Division was largely due to the urgent recommendations made by the Drought Investigation Commission for bridging the gulf which had undoubtedly existed for a long time between the Department and the rural population, or, in other words, to bring the expert staff of the Department into closer touch with the farming community. The Division is intended to represent that link or bridge. The functions of the Division, therefore, lie in the direction of disseminating—on broad lines—expert agricultural knowledge as widely, as cheaply, and as expeditiously as possible, and to assist in organizing farmers. This work is done by means of grouping departmental officers from time to time on itineraries arranged in accordance with the needs of the centres or areas concerned and by means of the *Demonstration Train*, which is in reality an agricultural school on wheels. [See §13 (5) below].

As an additional means at the disposal of the Division, or what may be more correctly termed the main link between the Division and the rural population, is the *District Agent*. Ten such officers have been appointed and allocated to certain areas, within the limits of which their work will lie in advising farmers on agricultural matters, receiving applications for lecturers and demonstrators and transmitting these to the proper quarter, and assisting in agricultural organization. If the scheme of appointing District Agents proves a satisfactory and workable one, its expansion is inevitable.

11. **Division of Agricultural Economics, Markets, and Co-operation.**—The Division of Agricultural Economics, Markets, and Co-operation came into being early in 1925, and the already existing activities in connexion with the monthly crop and market report and co-operation were transferred to the new Division. The problem of every farmer, and of the Department of State responsible for furthering the business interests of the farmer, is to determine how the different factors of production can be made more effective. To do so, it is necessary to ascertain the efficiency of these factors on every farm and in every part of the country.

To determine this, investigation must be made into the management of the farm, the marketing of produce, and the organization of producers, middlemen, and consumers. Any shortcomings or difficulties in these respects must then be removed by means of education.

It is, however, necessary to begin upon the performance of certain essential groundwork extending in every possible direction, since the absence of investigation in one particular direction may, to a large extent, negative the results achieved in another.

The main aspects of the Division's duties, apart from administration, are those of (*a*) farm management and general economic questions; (*b*) marketing; and (*c*) co-operation; in respect of each of which investigation, education, and extension are necessary.

Each of the above sections has sub-divisions, such as, amongst others, the following:—

(a) *Farm Management and General Economic Questions.*

(i) Nature and types of South African farming in the different parts of the country in respect of the property of 90,000 white farmers.

(ii) Physical factors on farms and the various forms of land tenure—ownership, lease system, and so on.

(iii) Expenses, income, profits, or losses in connexion with farming in different parts of the country.

(iv) Cost of production, in different areas of the country, of various agricultural products.

(v) Nature of labour and labour requirements of farms.

(vi) Capital conditions and capital requirements of farms.

(vii) Other economic questions, such as transport, etc.

(viii) Reports on the condition of crops, market prices, etc., (Crop and Market Report).

(b) *Marketing.*

(i) Conditions at existing municipal markets in the large and other centres of the four Provinces. (There are about a dozen large markets, but nearly every small village has its own municipal market.)

(ii) Other marketing organizations, companies, exchanges, agents, and so on.

(iii) Markets in other parts of Africa.

(iv) Markets for maize, fruit, eggs, meat, etc., in Europe and other parts of the world.

For each of the important products, there are different market processes, and each product has its own peculiar features and difficulties in connexion with its collection, grading, and standardization, packing, storage, transport, financing, risks, sale, distribution, information, propaganda, and advertising.

(c) *Co-operation.*

(i) Its necessity, underlying principles, and methods; investigation; education; organization, and advice in connexion with the various products enumerated above.

(ii) Formation of co-operative societies, including framing of regulations, development of business, ensuring proper management, etc.

(iii) Sound development of co-operative societies, to secure which legislation, regulations, inspections, guidance, and assistance will, amongst other things, be necessary.

(iv) A study of social conditions generally prevailing on farms as a foundation for the development of co-operative undertakings and scientific methods.

Farmers in South Africa to-day probably suffer more loss through bad management and bad business methods than through wrong or faulty methods of production, and field and animal husbandry generally. How many farmers lay out their farms so as to secure the greatest possible economy in labour, and arrange the work so as to ensure the fullest possible employment of it throughout the year? How many farmers know anything about the cost of production? How many can keep books, without which production costs, payments, receipts, and profit and loss cannot properly be determined? How many know what actually happens to their produce in the process of marketing? How many have a proper conception of the principles and methods of co-operation? The management and business aspects of farming have hitherto been neglected, and there is need of much development in this direction.

12. **Grading of Agricultural Products.**—It has been generally recognized that the success of South African agriculture in relation to the great overseas markets depends largely upon the existence of a proper system of Government supervision and grading, with the object of ensuring that a satisfactory standard of quality in regard to staple products exported is generally maintained. Various laws have been passed and regulations made in this connection, principally in respect of dairy produce, fruit, grain, wool, meat, and hides and skins. Act No. 16 of 1922 provided that any agricultural product could be submitted to the authorities for inspection and grading on payment of a fee, and fees collected for any such product were to be placed to a special account, which could be utilized for the development of the particular branch of agriculture concerned.

13. **Agricultural Organization in the Union.**—The importance of agriculture to the Union is reflected in the activities of the rural community in safeguarding and furthering their many interests through the medium of societies of farmers formed for the purpose of co-operation with the Government and generally for mutual assistance in coping with the problems of the industry. Organizations of this nature were in operation in the two Dutch Republics and the British South African Colonies in earlier years, and their activities played an important part in the gradual removal of the difficulties which retarded the advancement of agriculture in their respective areas, with the result that the machinery whereby the interests of agriculturists in the Union of South Africa are promoted is now represented by a well-organized body exercising paramount influence in agricultural matters in the Union.

There are in each of the four Provinces of the Union a number of Agricultural Societies and Farmers' Associations, some four hundred in all, having as members a great many farmers representing the most influential and progressive section of the agricultural community. An important function of these bodies is the promotion of the various agricultural shows, of which those organized by the following Societies at the places mentioned are the most popular :—Western Province Agricultural Society (held at Rosebank about the end of February); Port Elizabeth Agricultural Society (held at Port Elizabeth in March); Central Agricultural Society (held at Bloemfontein in March); Witwatersrand Agricultural Society (held at Johannesburg at Easter); Pretoria Agricultural Society (held at Pretoria at the end of May); Royal Agricultural Society (held at Pietermaritzburg at the end of June); and Durban and Coast Agricultural Society (held at Durban about the beginning of July).

Most of the Societies are affiliated to one or other of the four provincial Agricultural Unions. The names and addresses of the respective secretaries of these provincial Unions are as follows :—

Cape Province Agricultural Union : James Woodin, P.O. Box 454, Port Elizabeth.
Natal Agricultural Union : D. M. Eadie, P.O. Box 572, Durban.
Orange Free State Agricultural Union : G. T. Welsford, P.O. Box 377, Bloemfontein.
Transvaal Agricultural Union : D. M. Allam, P.O. Box 937, Pretoria.

For each of these provincial Unions there is a *Standing Committee*, meeting at least four times in the calendar year, and there is an annual general meeting of each Union, attended by the delegates from the various affiliated bodies. From each of the provincial Unions ten delegates are chosen to form what is termed the *South African Agricultural Union*, which meets annually for the purpose of deliberating on matters affecting agriculture generally throughout the Union. A President is elected annually at each congress for the ensuing year and there is also an Executive Committee. The Secretary of the South African Agricultural Union is James Woodin, P.O. Box 454, Port Elizabeth. In addition to the delegates from the four provincial Unions, the adjoining territories of Rhodesia and Mozambique are also represented. The organization described has resulted in the creation of a system properly co-ordinated in such a manner that every interest of the agricultural industry is served thereby. Matters of local or parochial concern are dealt with by a network of organized bodies of farmers throughout the country. For purposes of wider but still provincial interest representatives are sent by these bodies to an annual congress, from which again a delegation is chosen for the final deliberative council at which general principles are considered. At all these congresses Government officers, for the most part experts on the subjects coming under discussion, are in attendance for the purpose of furnishing information on the work of the Government and advice generally on technical and other matters. The funds for carrying on the activities of these organizations are provided by subscriptions supplemented by grants from the Union Government and the Provincial Councils of the Cape and Transvaal.

An *Agricultural Advisory Board* was appointed by the Minister of Agriculture in February, 1920, to advise him on matters relating to agriculture. The Board consists of the Executive Committee of the South African Agricultural Union, the members of which are representative of the various provinces of the Union, and are elected at the annual conference of the Union. The members of the Board are called together from time to time by the Minister of Agriculture for the purpose of consultation, and to afford them an opportunity

of submitting their views on matters relating to agriculture and any proposed legislation in connection therewith. The Secretary of the Board is Mr. James Woodin, P.O. Box 454, Port Elizabeth.

The following is a representative list of bodies serving particular phases of the agricultural industry :—

(i) South African Stud-book Association (A. A. Persse, Secretary, P.O. Box 703, Cape Town).
This organization has the following Societies affiliated to it :—
(*a*) The Friesland Cattle Breeders' Association (Jas. Woodin, P.O. Box 544, Bloemfontein).
(*b*) The Shorthorn Society of South Africa (Cuthbert A. Pope, P.O. Box 173, Queenstown).
(*c*) The Afrikander Cattle Breeders' Society (P.O. Box 377, Bloemfontein).
(*d*) The Devon Cattle Breeders' Society of South Africa (R. Barker, P.O. Box 82, Queenstown).
(*e*) The South Devon Breeders' Society of South Africa (P.O. Box 260, Pietermaritzburg).
(*f*) The Ayrshire Cattle Breeders' Society of South Africa (J. G. Torrance, P.O. Box 4344, Johannesburg).
(*g*) The Aberdeen-Angus Cattle Breeders' Society of South Africa (G. Wilson, P.O. Box 6926, Johannesburg).
(*h*) The Hereford Breeders' Society of South Africa (J. G. Torrance, P.O. Box 4344, Johannesburg).
(*i*) The Hackney Horse Society of South Africa (R. Ovendale, P.O. Box 611, Bloemfontein).
(*j*) The Merino Stud Breeders' Association of South Africa (A. A. Persse, P.O. Box 703, Cape Town).
(*k*) The Pig Breeders' Society of South Africa (A. A. Persse, P.O. Box 703, Cape Town).
(*l*) The Sussex Cattle Breeders' Society of South Africa (J. G. Torrance, P.O. Box 4344, Johannesburg).
(*m*) Angora Goat Breeders' Society of South Africa (A. A. Persse, P.O. Box 703, Cape Town).
(*n*) Red Poll Cattle Breeders' Society (J. G. Fraser, P.O. Box 250, Bloemfontein).
(*o*) Jersey Cattle Breeders' Society of South Africa (R. H. Mason, P.O. Box 207, Pietermaritzburg).
(ii) Stud-book of Thoroughbred Horses of South Africa (per Jockey Club of South Africa ; Major F. J. Henley, Secretary, P.O. Box 183, Johannesburg).
(iii) The Nurserymen's and Seedmen's Association of South Africa (Secretary, P.O. Box 120, Bloemfontein).
(iv) The Western Province Beekeepers' Association (A. J. Hopper, Secretary, "Belmont," 64 Kloof Street, Cape Town).
The South African Association of Beekeepers, P.O. Box 6057, Johannesburg.
(v) The Co-operative Wine Farmers' Association of South Africa, Ltd., Paarl.
(vi) The South African Sugar Association (P.O. Box 572, Durban).
(vii) The South African Maize Breeders', Growers', and Judges' Association (P.O. Box 3609, Johannesburg).
The South African Grain Trade Association, (P.O. Box 921, Johannesburg).
(viii) The South African Poultry Association (H. N. Wheeldon, P.O. Box 6463, Johannesburg).
(ix) The South African Co-operative Creameries Association (Fraser & Scott, Bloemfontein).
The Secretary, East Griqualand Co-operative Cheese Federation, Kokstad.
(x) The Fruit Growers' Co-operative Exchange of South Africa, Ltd. (P.O. Box 1158, Pretoria).
(xi) Farmers' Meat Industries, Ltd., Pietermaritzburg.
Central Agency for Co-operative Societies, Ltd. (P.O. Box 1015, Johannesburg).
The South African Co-operative Cotton Growers, Ltd. (P.O. Box 1462, Durban).
The Central Co-operative Cotton Exchange, Ltd. (P.O. Box 1462, Durban).
Federated Farmers' Co-operative Association of South Africa, Ltd. (P.O. Box 414, Johannesburg).

In connection with the above list, it is to be noted that in recent years the distinctive tendency in the sphere of agricultural organization in the Union has been the growth of co-operative effort in the shape of farmers' associations and exchanges for the marketing of agricultural and pastoral products.

14. **Legislation.**—The following statement gives a summary of agricultural legislation since 1910, together with a list of matters dealt with in Government Notices and Proclamations under the various Acts :—

AGRICULTURAL LEGISLATION, 1910 TO 1925.

Act.	Matters Dealt With in Government Notices and Proclamations.
Agricultural Pests Act, No. 11 of 1911, as amended by Act No. 32 of 1917, Act No. 12 of 1922, and Act No. 6 of 1924	Bee importation restrictions ; citrus trees ; grapes and vines ; importation of beeswax, foundation comb, fruit, plants, and exotic animals ; importations from Portuguese East Africa, Rhodesia, and South-West Africa ; lucerne seed ; maize and barley ; nurseries registration ; pernicious scale ; ports of entry ; prohibited areas ; wart disease on potatoes.
Agricultural Pests (Citrus Canker) Act, No. 10 of 1919	
Co-operative Societies Act, No. 28 of 1922, as amended by Act No. 38 of 1925	Registration.
Dairy Industry Act, No. 16 of 1918	Babcock system ; butter, cream and milk inspection, testing, and grading ; distinctive marks ; regulations and forms.
Drought and Flood Distress Relief Act, No. 28 of 1916	

AGRICULTURAL LEGISLATION, 1910 TO 1925—(*continued*).

Act.	Matters Dealt With in Government Notices and Proclamations.
Drought Distress Relief Act, No 16 of 1924	Relief of distress caused by drought.
Fencing Act, No. 17 of 1912, as amended by Act No. 11 of 1922	
Fertilizers, Farm Foods, Seeds, and Pest Remedies Act, No. 21 of 1917	Fertilizers and farm foods; sale of pest remedies; stock dips.
Agricultural Products Grading Act, No. 16 of 1922	Cheese; citrus fruit; cotton lint and seed cotton; cotton levy; deciduous fruit; dried fruit; eggs; egg levy.
Registration of Pedigree Live Stock Act, No. 22 of 1920	Extension of Act to South-West Africa.
Diseases of Stock Act, No. 14 of 1911, as amended by Act No. 25 of 1916, No. 31 of 1923, and No. 18 of 1925	Anthrax inoculation and prevention; brands; compensation for animals destroyed; contagious abortion; co-operation between Government officials and stock owners; dogs; dourine; East Coast fever; enforced dipping; exports to United States; immunization and insurance of horses and mules; importation from Great Britain, neighbouring territories, Netherlands, Rhodesia, South-West Africa; movement of cattle from Natal and Griqualand East; ports of entry; reporting, selling, buying, moving, and disinfecting of stock, etc.; reporting sickness or death of stock travelling on public roads; scab; sheep removal prohibition; brands, dipping tanks, and movement of stock in Transkei; tuberculosis.
Stock Theft Act, No. 26 of 1923. Cape Province Cattle Cleaning Act, No. 11 of 1910, as amended by Act No. 32 of 1917	
Agricultural Produce Export Act, No. 35 of 1917	Bacon and ham; butter; cheese; dried fruit; eggs; eggs levy; lucerne seed; maize; meat.
Angora Goat Export Prohibition (Repealing) Act, No. 17 of 1922	
Fruit Export Act, No.17 of 1914, as amended by Act No. 31 of 1917	Citrus fruits; deciduous fruits; levy.
Beef Export Bounties Act, No. 12 of 1923	General.
Restriction on the Importation of Wine and Spirits Act, No. 14 of 1921	
Sale of Agricultural Produce on certain Mines Act, No. 19 of 1917	General.
Wine, Spirits, and Vinegar Act, No. 15 of 1913	
Wine and Spirits Control Act, No. 5 of 1924	
Agricultural Industries Advancement Act, No. 16 of 1925	Levies on agricultural produce.
Orchard Cleansing Act, No. 13 of 1925	Eradication of insect pests in orchards.
Public Auctions and Transactions in Live Stock and Produce Act, No. 22 of 1925	Regulation of sales by auction of live stock and produce.
Wild Birds Export Prohibition Act, No. 6 of 1925	Control of export of wild birds.

NOTE.—In addition to the above, agricultural questions are indirectly affected by legislation dealing with other matters, e.g. land settlement and tenure, land bank, labour and wages, natives.

§ 2. Live Stock and Pastoral Production.

1. **Horses, Mules, and Asses.**—(i) *History of Horse-Breeding.*—The horse is not indigenous to South Africa, but was, on the other hand, the first domestic animal to be imported nearly three centuries ago, and subsequently played an important part in establishing the supremacy of the white race and furthering its extension and development. The first

horses were imported from Java, and were the descendants of *Arabian* and *Persian* horses sold to the Eastern nations by Arabian traders during the fifteenth and sixteenth centuries. From time to time new blood was obtained from Arabia (1689), South America (1778), North America (1782), England (1782), and Spain (1807). Notwithstanding all the fresh blood obtained from these quarters, a close study of the horse stock of those countries at the times of importation indicates that *Arabian* blood was nevertheless predominant. A little over a century after the arrival of the first horses the industry of horse-breeding had flourished so well that the first shipment of remounts was exported to India, thus opening a remunerative trade which brought the horse from the Cape fame not only in India but in Egypt, and even in the Crimea. Further particulars as to the history of South African horse-breeding will be found in previous issues of this *Year Book*.

(ii) *Natural Suitability of the Country for Horse-Breeding.*—The suitability of the Union for horse-breeding has been recognized since the earliest times. The climate, the pastures, and soils, combine to produce a horse with a good constitution, strong bone, tendon, and hoof. The localities naturally best adapted to the profitable rearing of horses are those where soils of the Karroo system of rock formation prevail. Soils of this nature are generally rich in lime and such constituents as are required to yield nutritious pastures. The comparatively small size attained by the South African horse is largely due to deficient nutrition of the young stock during the winter months and prolonged periods of drought. The Karroo system in varying formation spreads over almost the whole of the Union, and wherever such soils appear horse-breeding can be taken up with success. With the exception of the coastal regions of Natal and immediately south of Natal, the parts north of the districts adjacent to the Vaal River in the Transvaal and the extreme barren parts of Bechuanaland, the Union throughout is eminently suited for horse-breeding. Mules do well wherever horses flourish and the ass thrives well even where horses cannot exist. Generally it may be observed that horses do well wherever conditions are best suited for sheep.

(iii) *Export of Horses.*—The export of South African horses, apart from the export of thousands of remounts which began as early as 1769, was continued for breeding purposes in 1810, when Australia obtained from South Africa the first horses introduced into that country. Importations were repeated until Australia's horse-breeding was firmly established. Many stallions and other horses were bought by the rich Nabobs of India, and for a time South African horses were famous in India as racers. Throughout the nineteenth century horses were exported in varying numbers and quality to distant parts of the world, and in large quantities to Mauritius, Ceylon, Bourbon, South America, and various parts of India. The foundation stock of the late German Colonies and of Portuguese territories, as well as of the whole of Central Africa where horses can exist, is by preference based on the *Cape Horse*.

(iv) *Present Type of Horse.*—Whatever foreign blood may be in the veins of the horse stock of the Union, that stock still forms a type by itself. The type is still predominantly of *Thoroughbred* strain, while the *Arab* and improved blood of the last century has not quite disappeared. None of the other breeds of horses has established itself to any important extent, although small studs of good animals of other types exist throughout the Union. The tendency at present is to breed from heavy sires in order to increase the size, and to produce a type for general utility.

(v) *Mules.*—The ass was imported into South Africa at a very early date from the Cape Verde Islands. Most probably these asses were of Spanish origin and of Andalusian stock. Early in the eighteenth century the area now known as the Malmesbury District was settled, and grain farming became a special feature of the rich live stock farmers. The most famous studs, as well as the Government Experimental and Stud Farm, were situated here, and mule-breeding seems to have been taken up at an early date, in order to supply faster draught animals than the ox to cope with the ever-expanding corn fields. This supply has always been insufficient, and the studs in the north, in the old and new Hantam, took up the breeding of mules. Ultimately the industry became general throughout the country with intensive areas in the best districts. The South African mule, although somewhat light, is a most useful animal, very hardy, of excellent constitution, willing, and capable of much work to an advanced age. Good mules are always in demand and fetch high prices.

(vi) *Statistics.*—The following table gives particulars of horses, mules, and asses in the Union. In 1919, 1920, and 1922 the censuses did not cover either the native areas or the towns, and in 1923 and 1924 the censuses did not cover the towns. The numbers shown in 1918 and 1921 have therefore, for convenience of comparison, been assumed and included for the intervening and subsequent years. Details of imports are given under the heading "Living animals" in Chapter XVIII.

HORSES, MULES, AND ASSES IN EACH PROVINCE AT GENERAL CENSUSES OF 1904 AND 1911, AND AGRICULTURAL CENSUSES, 1918 TO 1924.

Year.	Cape of Good Hope.	Natal.	Transvaal.	Orange Free State.	Union.
HORSES.					
1904	255,060	66,574	51,654	76,251	449,539
1911	333,962	75,567	89,160	220,725	719,414
1918	367,605	65,839	106,698	240,880	781,022
1919	387,355	74,994	124,106	269,891	856,346
1920	376,760	78,420	133,508	262,644	851,332
*1921	417,315	85,655	147,313	270,185	920,468
1922	431,588	95,242	160,473	300,791	988,094
1923	408,489	102,180	149,317	262,324	922,310
1924	390,700	104,211	157,157	261,128	913,196
MULES.					
1904	64,433	4,450	43,917	21,934	134,734
1911	47,059	15,602	25,275	5,995	93,931
1918	52,086	6,983	13,818	11,672	84,559
1919	59,351	6,717	15,155	15,369	96,592
1920	65,958	6,731	17,351	18,197	108,237
1921	71,858	6,312	19,332	19,287	116,789
1922	78,757	7,197	21,260	21,773	128,987
1923	81,895	9,069	22,759	19,662	133,385
1924	84,159	10,116	25,175	19,657	139,107
ASSES.					
1904	100,470	2,418	32,496	6,546	141,930
1911	191,086	28,018	106,048	11,558	336,710
1918	315,333	48,905	149,411	40,667	554,316
1919	363,822	50,363	167,680	41,546	623,411
1920	361,790	52,699	192,040	41,816	648,345
1921	391,602	54,513	229,667	46,456	722,238
1922	435,911	60,805	259,226	52,633	808,575
1923	422,069	66,310	245,164	51,494	785,037
1924	414,600	68,614	251,456	52,261	786,931

* A detailed classification of the number of horses in the Union in 1921, according to age, will be found in the sixth and previous issues of this *Year Book*.

2. **Cattle.**—(i) *History of Cattle-Breeding.*—The first colonists who landed at Table Bay found large herds of cattle in the possession of the nomadic native tribes. The resources of the country in respect of the supply of fresh meat induced the Dutch East India Company to provision its ships trading with India and the East with supplies of this kind from the Cape of Good Hope. At a later stage, during the days of the pioneer colonists, cattle had to be relied upon, in the absence of railway communication, for the transport services required for the development of the country. As a consequence cattle were bred which possessed great hardiness, rustling qualities and constitution, and the capacity to stand long treks, and which could be relied upon for draught purposes. In the course of time there was created a distinct breed which came to be known as the *Afrikander*. Remarkable progress has been made within the last decade in improving the early maturing beef and fattening qualities of this breed.

Until within comparatively recent times the introduction of European breeds was confined to the importation of *Friesland* cattle from Holland, the first importation having taken place about 1780. Not until the nineteenth century were importations of British breeds made. As far as is known, the earlier animals consisted chiefly of *Shorthorns* and *North Devons*. The outbreak of rinderpest in 1896 decimated the herds of cattle which had by that time become established in considerable numbers in the northern Provinces and in the eastern Cape Colony, and a few years later the numbers of cattle were further depleted through the ravages of the Anglo-Boer war.

Since then a notable advance has been made in cattle-breeding. The prevention and control of stock diseases, now extended to all parts of South Africa, have reduced the risks previously involved, and farmers and others are now disposed to invest money in cattle-breeding operations. Reliable statistics are not available for the period prior to 1904.

The census returns taken in 1904 show that the cattle of South Africa numbered 3,500,000 head. In 1911 the number had increased to 5,797,000 head in the Union, in 1918 to 6,852,000, and in 1924 to 9,898,000. By far the larger proportion of these animals is of mixed breed, possessing a marked infusion of *Afrikander* and native blood, though large numbers show the influence of several of the improved European breeds. During the last decade in particular a marked improvement has been noticeable in the herds throughout the country, brought about by importations of sires and by the establishment of pure-bred herds, from which bulls in considerable numbers are now bred and used for the grading up of ordinary herds. A great part of the impetus was due to importations by the Government and object lessons in management at the Experiment Farms. The formation of the South African Stud-Book Association in 1905, and, at a later stage of natural development, of different Breed Societies affiliated thereto, which are enumerated elsewhere in this chapter, has promoted the breeding of pure-bred stock and protected and fostered the interests of breeders. Each of the following breeds has its Breed Society: *Friesland, Shorthorn, Hereford, South Devon, Aberdeen-Angus, Ayrshire, Afrikander, Sussex, Red Polls, Jerseys,* and *Devon.* Other breeds to be found in the country, though in comparatively small numbers, are *Brown Swiss, Siementhaler, Kerry,* and *Galloways.* The records of the Stud-Book Association indicate the progress which is being made in the breeding of pure-bred cattle. In the first volume of the Stud-Book the entries numbered about 400, while in Volume XV, 6,917 head were registered. This may be taken as approximately the number of pedigree cattle bred and imported during the previous year.

Under the Ocean Mail Contract of 1912 pedigree cattle are conveyed to South Africa free of freight. The number of cattle introduced up to the 31st December, 1923, as the result of this provision was 3,367; in 1924, none; and in 1925, 91.

During recent years the prospects of an export trade have stimulated breeders to improve the type of cattle bred for beef purposes, and the fattening of cattle is receiving increasing attention. The Department of Agriculture has at its agricultural schools and experiment farms conducted upon oxen of different types and ages a large number of feeding experiments which have proved of value to breeders and feeders, and experimental shipments of the meat of these oxen to the London market have provided useful information. Good breeding stock is in considerable demand, but with the general fall in value prices are low.

(ii) *Number of Cattle in the Union.*—The figures given in the table hereunder represent the number of cattle in the Union as returned at the general censuses of 1904 and 1911, and at the censuses of pastoral production beginning with 1918. In 1919, 1920, and 1922 the censuses did not cover either the native areas or the towns, and in 1923 and 1924 the censuses did not cover the towns. The numbers shown in 1918 and 1921 have therefore, for convenience of comparison, been assumed and included for the intervening and subsequent years.

CATTLE IN EACH PROVINCE, 1904, 1911, AND 1918 TO 1924.

* A detailed classification of the cattle enumerated at the 1921 census, according to age, will be found in the sixth and previous issues of this *Year Book.*

† Information with regard to breeds of cattle in 1922 will be found in *Year Books* Nos. 6 and 7.

3. **The Beef Industry in South Africa.**—(i) *Cattle Ranching.*—In the natural development of any new country's agricultural resources cattle ranching forms the pioneer method of farming. With the growth of population and development of the railway system closer settlement follows. Land becomes too expensive for the old wasteful form of production, and ranching is relegated to the more isolated grazing regions, its place being taken by more intensive systems of farming.

As necessary conditions to make ranching a profitable enterprise, the following may be mentioned: Cheap land, good grazing all through the year, suitable water supply, cheap breeding stock, proper herd and veld management, and suitable markets. Of these the first two are of paramount importance.

The main potential ranching areas of the Union are situated in the northern Transvaal. With the exception of a section of ranching country in Bechuanaland, it is confined wholly to the northern Transvaal, and in particular to the Districts of Waterberg, Zoutpansberg, Pietersburg, and Lydenburg, and to smaller sections of Rustenburg, Marico, and Barberton. Good winter grazing is to be obtained on the so-called " sweet " veld of the Bushveld, a type of veld that forms the mainstay on the range during the winter months. Solely sweet veld is, however, undesirable. It is inclined to be too washy in summer, does not come away as early in the spring, and is not as drought resistant as the " sour " veld. In selecting ranches it is important that a thorough study of the grazing value of various types of veld be made first. There are certain farms and sections in the ranching areas that will probably only be suited to cattle farming. On the other hand, many farms will, with closer settlement, have inevitably to be developed, for economic reasons, on more intensive lines.

It must be pointed out that in selecting a ranch, besides the grazing value, possible future development must be considered. It follows that if there are possibilities for cotton, citrus, dairying, or other types of farming, one can afford to pay more per " unit of carrying capacity "* than otherwise. A ranch so chosen will increase in productive capacity as time goes on. With the insufficient data available it is difficult to state accurately the ranching value of a " unit of carrying capacity," but it may safely be taken at somewhere between £3 and £5 per unit at the outside. The quality of the animals herded also plays an important part in determining the maximum value per unit of carrying capacity. The average investment of £4 per unit would mean that from 4s. to 5s. interest would have to be reckoned per head per year on the capital investment for grazing, interest being taken at from 5 to 6 per cent. The fencing required on farms of heavy carrying capacity is also much less than where there is a low carrying capacity. Nearly all Bushveld farms have suitable timber for fencing-posts, so that the expense of fencing is not great. Provided ranches are selected with a view to their possible future agricultural development, experience has shown that the interest per unit of carrying capacity is an unfair charge, since the increased future possible production on and increased value of the land is greater, reckoned per decade, than the 5 or 6 per cent. charge on capital invested in land. Then, also, in the selection of ranching land natural shelter and availability of water must be considered. The latter is generally amply supplied by running streams, dams, boreholes, etc., and the natural bush provides sufficient shelter for stock.

There are over nine million head of cattle in the Union. The cattle population is densest in the eastern Transvaal, Orange Free State high veld area, in Natal, and the eastern coastal area of the Cape Province. These areas include a large number of dairy stock. The undeveloped typical ranching areas do not, as yet, show a very heavy cattle population. The great majority of cattle in the Union consist of herds of indigenous cattle possessing a marked infusion of Afrikander blood. This type of heifer or cow is cheap, and admittedly forms the best foundation on which to build. It should be the aim of the rancher to select a foundation female herd consisting of the utility type of cow: large, roomy, and vigorous. It is generally advisable to select the foundation herd in the area where ranching is to be practised; such animals are acclimatized, and the initial losses are therefore much reduced. If selected in sections of the country where redwater and gall-sickness are not virulent, only young stock inoculated against these two tick-borne diseases is recommended. If selected and treated as suggested, the initial losses will be very small. A suitable cattle dipping tank is a necessary adjunct on every ranch. If regular summer and winter dipping is carried out, all tick-borne diseases can be controlled effectively.

The bull is naturally the most important individual in the herd. The improvement effected, in the first cross, by suitable pure-bred sires is phenomenal. The second cross may still be successful, but subsequent crosses, as a rule, under ordinary conditions, do not produce satisfactory results. This, it is considered, is largely because the vigour of heterozygosis has been lost, and during lean years the very early maturing animal fails to make profitable growth. Until such time as a definite one can be stated, it is suggested that a breeding policy on the following lines will be safe and productive of good results :— The foundation stock of selected native cattle is crossed with pure-bred bulls belonging to the Shorthorn, Angus, Sussex, Hereford, or Devon breeds. The second cross is made with similar bulls of the selected breed. The heifers produced out of this mating are crossed back to pure-bred improved Afrikander bulls. The heifers thus produced are again mated to bulls belonging to the original beef breed selected for two successive generations. The process is repeated so that after every two infusions of blood of the very early maturing beef breeds there is a top cross of the pure-bred improved Afrikander. This policy does not sacrifice early maturity, beef form, hardiness or rustling qualities. There is, further, an infusion of vigour due to heterozygosis for two generations out of every three. This introduction of vigour, which can be noticed in any first cross, is an important factor in making the policy a safe one.

Many ranching areas are already progressing towards agricultural production in other directions. The areas where farmers will devote their energies to the production of choice

* A " unit of carrying capacity " is the amount of land required to carry a mature ranch cow for one year.

beef are in the heavy maize-producing sections of the country, and perhaps also, to a less limited extent, in the other heavy cropping areas of the Union. The future system of beef production that South Africa will have to follow for the export trade, as well as special local markets, is the production of the store on the ranch and the finishing off of this animal in the maize sections during the late winter and early summer months.

(ii) *Marketing.*—The export of beef from South Africa commenced in 1914 and continued on a comparatively large scale until 1920. Export since then has been small and unimportant, as prices in Europe have been low, and cattle raisers in this country were not compelled to market their cattle. In 1923, Parliament passed the *Beef Export Bounties Act*, whereby ½d. per lb. is paid on all beef exported and ¼d. per lb. on the live weight of all cattle exported. Under this Act cold storages handling the beef must be registered, and their charges must be approved by the Government; further, they must undertake to give services to producers at these approved charges. Cold storage accommodation, facilities for the slaughtering and preparation of cattle for export, and efficient handling of by-products in order to make full use of same, already exist at the chief centres of the Union. At the principal ports there are cold storage facilities in excess of present requirements. Provision is made by the *Agricultural Produce Export Act* of 1917 for the inspection and grading of meat for export. In order to assist the live stock industry the Railway Administration gives specially reduced freights both for live cattle and for dead meat intended for export. (See also paragraph 12 below.)

Geographically, South Africa is very favourably situated for meat export to the European markets. The refrigerated steamer accommodation available, as well as freight charges, compare more than favourably with those operating in the case of the great meat exporting countries.

The organization of the meat trade within the Union, more especially in the Johannesburg market, has formed the subject of inquiry by various Government Commissions since 1918, when attention was first drawn to the matter by the Cost of Living Commission. A Meat Trade Investigation Commission, appointed in 1919, made several recommendations, and the question was in March, 1922, taken up by the Board of Control under the Profiteering Act, 1920, which confined its inquiry to the conditions in the Johannesburg market. Criticisms were directed by the Board against certain features of the organization of the Johannesburg meat trade. The subject of the meat trade in general was further inquired into by a Select Committee of the House of Assembly in 1922, which approved of the co-operative principle in the marketing of meat and made a number of recommendations as to the organization of the internal meat market and the export trade.

(iii) *Inquiry by Board of Trade and Industries into Meat Trade.*—Recently the Board of Trade and Industries held an inquiry into the meat trade in general.

The terms of reference were :—

(*a*) the application of the contract entered into on the 22nd day of March, 1898, between the Government of the late South African Republic and the late Pieter Johannes Potgieter and Hendrik Jacobus Schoeman, forming the basis and origin of the "Transvaal Koelkamers, Beperkt."

(*b*) The control exercised by the Government and the financial relationship created between the Government and the "Transvaal Koelkamers, Beperkt," under and by virtue of the contract mentioned under (*a*).

(*c*) The operations of the "Transvaal Koelkamers, Beperkt," in respect of the meat trade in the Union of South Africa, from its inception to the present date, and the relation of that body to any other concern trading in live stock or meat or other cold storage products.

(*d*) The position of the concern known as "The Imperial Cold Storage, Limited," in connexion with the meat trade, the trade in fresh fish, and the supply of foodstuffs generally in South Africa, including the South-West Protectorate.

(*e*) The acquisition by the said Imperial Cold Storage Company, Ltd., of the companies known as :

(1) the South African and Australasian Supply and Cold Storage Company, Ltd. ;

(2) the South African Supply and Cold Storage Company, Ltd. ;

(3) the Cold Storage Trust, Limited.

(*f*) The interests and the controlling power exercised by the Imperial Cold Storage Company, Ltd., in and over other South African concerns which are the suppliers of foodstuffs of any kind.

(*g*) The question whether, and if so in how far, a trust or ring in meat, fish, and other foodstuffs has been created in South Africa and the best means of remedying any unsound condition which may have sprung therefrom.

(*h*) The market values of stock in the large centres of the Union, compared with :

(1) the prices charged to wholesale dealers ; and

(2) the prices obtained in retail trade by butchers ; the main causes of extensive fluctuations : facilities prevailing to enable farmers to obtain the best quotation for their cattle or otherwise ;

(3) what reasonable policy should be adopted for improvement of the conditions arising under (*h*) (*1*) above.

(*j*) The export of meat from the Union, especially with a view to the prices realized overseas as compared with the prices levied by the retail trade in South Africa and charged to the public.

In its report the Board makes far-reaching recommendations, the principal of which is that the Government should, in conjunction with co-operative societies, provide cold storage facilities at Cape Town, Johannesburg, Durban, De Aar, Port Elizabeth, and East London. The cool stores should be established primarily for meat producers, but should be available for other perishable foodstuffs. (Report No. 54.)

(iv) *Imports and Exports of Beef.*—For some time after the Anglo-Boer war the herds were so depleted in numbers and the demands for cattle for breeding purposes and transport work were so considerable that large quantities of frozen meat had to be imported to supply the requirements of the population, military and civilian. Since then, however, conditions in this respect have changed fundamentally, and the importation of beef has been reduced to negligible proportions.

The following tables show (i) the imports and exports of beef in the oversea trade since 1910 ; (ii) the number of animals slaughtered in abattoirs during the years 1918–19 to 1923–24 :—

the year. Dairying is no longer looked upon as a side line by farmers; large numbers are now specializing in dairy farming and improving their cattle, with a view solely to increasing their output of milk and cream, while the arable portions of their farms are devoted entirely to the production of foodstuffs for dairy cattle.

It may be said with confidence that great expansion of the dairy industry in South Africa is to be expected. If the present rate of progress is maintained, a great future is assured.

The principal crops grown for the feeding of dairy cattle are maize, lucerne, oats, teff grass, millet, mangolds, rye, and cow-peas, all of which do well in most of the areas devoted to dairy farming. Considerable quantities of maize are grown for silage and maize hay, and the use and value of all the above-mentioned fodders are being increasingly realized.

There are indications that cotton and peanuts will soon be cultivated on a large scale in South Africa, and the very useful residues from these crops, in the form of cotton-seed and peanut cake and hay, will form an important addition to the feeds available for cattle.

Most dairy breeds do well in South Africa. *Frieslands* and *Ayrshires* are probably the most popular, though *Jerseys*, *Dairy Shorthorns*, *South Devons*, and *Red Polls* are to be found in considerable numbers. The bulk of the dairy herds consists of what may be called *Utility Animals*, in which *Friesland*, *Ayrshire*, and *Shorthorn* blood predominates. There is a large number of pure-bred herds of each breed.

(ii) *Administration, Organization, and Legislation.*—Until the first creamery had been started in the year 1892, near Bedford, in the Cape of Good Hope, no organized development of dairying in South Africa had been attempted. At this stage the possibilities began to be realized, and, contingently, the necessity for educating farmers and those concerned in the science and practice of the industry. The Cape Government sent an officer of the Department of Agriculture to Australia to inquire into the latest methods of dairying in vogue there. As soon as the investigator had returned from Australia, the Cape of Good Hope Government commenced giving instruction in dairying through the medium of a travelling dairy in charge of an expert. In this way the Department's newly acquired knowledge was disseminated directly amongst the farmers. Natal was the next to follow suit, and engaged the services of an expert, whose first two years of work consisted principally in lecturing and demonstrating modern methods of dairying in that Province. The Orange Free State made a similar appointment during the Crown Colony administration, and in the year 1904 a Division of Dairying was included in the Transvaal Department of Agriculture. Meanwhile, in the Cape, the Elsenburg School of Agriculture had been giving useful practical instruction in dairying, and similar institutions opened later in Natal, the Transvaal, and the Orange Free State. Important to the development of the industry was the propaganda work of an expert in co-operation, who was engaged in 1905 by the Cape Government.

With the establishment of the Union came a new era of progress in dairying. The industry now began to be fostered on a national scale, and a Division of Dairying, incorporated in the Union Government's Department of Agriculture, consolidated and built upon the work already begun in the various Provinces. The present staff of the Division includes a superintendent of dairying, an assistant superintendent, seven inspectors, and two cheese graders, while a supervisor and seven travelling recorders are responsible for the official milk records.

The office of the Division of Dairying in Pretoria is a constant source of free information on all questions pertaining to dairying. One or more of the Division's inspectors are stationed in each of the four Provinces of the Union, and it is their duty to travel among the farmers and give advice and instruction in approved methods of production, and in all matters pertaining to dairying and dairy farming; as well as to administer the provisions of the *Dairy Industry Act* and to grade all butter and cheese for export overseas. The grading of produce carries with it a strong though indirect educational influence, as also does the work of the Milk Recorders attached to the Division, who are kept continually employed in carrying out check and butter-fat tests for the Official Milk Records Scheme. In September 1923, the work of milk recording was taken over entirely by the Division of Dairying, and provision was made for the granting of semi-official certificates to non-pedigree cattle at a specially low rate. This should prove a great stimulus to the breeding of better milk cattle in the country.

At the present time there are two main legal measures under which the dairy industry is directed. The first is the *Dairy Industry Act* (No. 16, 1918), which controls the internal economy of the industry. It provides "for the registration of dairy premises and the owners and occupiers thereof, for the marking of dairy produce and registration of marks thereon, and generally for the regulation of the dairy industry."

The second is the *Agricultural Products Grading Act* (No. 16, 1922), in which provision is made for regulations governing the export of dairy produce. These regulations provide for the compulsory grading of butter and cheese for export. The maximum content of water allowed in export butter is 16 per cent. As preservative, up to 0·5 per cent. of boron compounds, calculated as boracic acid, is permitted, but no other extraneous matter.

The *Co-operative Societies Act* (No. 28, 1918) and earlier Acts also claim mention in connection with South African dairying, for the industry is one which has proved itself peculiarly adaptable to co-operative organization in South Africa as in all parts of the world. (See "Agricultural Co-operation," § 12 below.)

(iii) *Development of the Industry.*—(a) *Creameries and Cheese Factories.*—The establishment of creameries and cheese factories has been a notable means of developing the dairy industry. The germ of the creamery movement must be looked for in the collection of cream for manufacture into butter at a place called Daggaboer's Nek, in the Cape of Good Hope, but pride of place as the first actual creamery to be started in South Africa must be given to the Avondale Dairy, established in the year 1892 in the Bedford District of the same Province. About a year later a number of small concerns, working on similar lines, sprang up in this district and spread farther afield; but it was not until 1896 that power-plant and refrigeration were introduced, the first creameries to instal such facilities being those at Adelaide, Bedford, and Bowker's Park. The introduction of cream testing was instrumental in making this development practicable, for previously, in the absence of means for directly ascertaining the butter-fat content of cream, each farmer's supply had been separately churned by hand power. These very wide and useful reforms were initiated by the Cape Government's dairy expert on returning from his mission of inquiry in Australia.

From these small beginnings a strong and prosperous dairy industry has grown up in South Africa. In July, 1925, there were in the Union 74 creameries with 48 ancillary cream depots, 133 cheese factories (not including private cheeseries run by farmers using solely the milk of their own cows), 1 margarine factory, 20 butter substitute factories (specially registered for the renovating or reworking of butter), and 1 condensed milk factory. Several of the creameries were started with the aid of grants from public funds, and are run on co-operative lines in so far as the dividends which they are allowed to pay to shareholders are limited to 10 per cent. Any balance must be refunded to the cream suppliers in proportion to the quantity they have supplied. Government loans (now made only to bona fide co-operative societies) were secured by a general bond over the assets of the borrowing society. New cheese factories, both co-operative and proprietary, are continually being started, and the above figures are no doubt now exceeded. Both the *Cheddar* and *Gouda* types of cheese are successfully made, most of the cheeseries preferring the latter, which is the more popular variety for local consumption.

(b) *Exports and Production.*—Whereas large quantities of butter and cheese were previously imported, during the years 1916 and 1917 not only was sufficient butter made in the Union for all local requirements, but a surplus was exported oversea. During 1924, butter to the amount of 430,270 lb. was exported, as well as 210,126 lb. of cheese, and the export trade in these commodities now appears to be fairly well established. Production has risen from 11,349,293 lb. of butter and 545,290 lb. of cheese in 1910–11 to 20,689,000 lb. and 5,900,000 lb. respectively in 1924. Regulations governing the export of butter and cheese have been brought into operation, and neither of these products can leave the Union before being officially graded according to quality, or (in the case of farm butter) unless marked "Ungraded farm butter" or "Cooking butter" (butter below third grade).

(c) *Local Grading.*—Arrangements have been made for the grading of *Cheddar* cheese for local consumption, for any cheese factory in the Union, at the nominal figure of ⅛d. per lb. and it was with a view to making grading general that a Cheese Federation was formed in East Griqualand. The two cheese graders above mentioned were appointed to undertake this work of grading.

(d) *Dairy Cattle.*—In the year 1911 there were shown to be 1,900,230 cows in the Union, At the next census (in 1918) the number was 1,924,925, exclusive of cattle in native locations, reserves, etc. The last returns taken on the 30th April, 1921, showed a total of 2,263,778 cows and heifers of two years old and over, exclusive of cattle in native locations, reserves, etc. Generally speaking, the unimproved cows of the Union produce a rather small quantity of milk, which is nevertheless of good quality. No statistics of milk production are available, but it may be said that within recent years great improvement has been brought about both as regards quantity and quality. Many more herds of first-rate milking capacity have lately been built up, while large numbers of pure-bred cattle have been and are still being imported; their progeny is spreading, and is having a marked influence for good upon the ordinary cattle of the country. This is undoubtedly largely responsible for the increased output of dairy produce.

(e) *Milk Records.*—A scheme for the keeping of official records has recently been devised by the Dairy Division of the Department of Agriculture, in conjunction with the Breed Societies. The owners of the cows entered have to weigh the milk at each milking, while an official recorder makes a check test of weights and also a butter-fat test during each month for two consecutive days in the case of pedigree cattle, and on one day in the case of non-pedigree cattle. The responsibility for the scheme, which was at first only shared

by the Department of Agriculture, was entirely taken over by the Division of Dairying in September, 1923. Official certificates are issued by the Superintendent of Dairying at the end of the lactation period of pedigree cows, and semi-official certificates are granted to non-pedigree animals, while there is an Advanced Registry for cows which attain a certain standard, and the records of pedigree cattle may be entered in the Stud Book. Under the previous arrangement the entire cost of recording was borne by the owners of the cows entered in a pro rata share per cow, but now fixed fees are charged by the Department, which are calculated to cover all the expenses entailed when the project is in full working order. The keeping of milk records is greatly on the increase. Many breeders and dairy farmers, having realized its vast importance, are coming under the scheme. One feature which is calculated to give a considerable impetus to this important phase of dairying is the fact that it has been possible to export to Great Britain a number of pure-bred Friesland animals taken from herds all over the Union; animals whose dams have qualified on the standard laid down by the British officials, viz., 12,000 lb. of milk, containing a minimum of 3·3 per cent. butter-fat. These animals were sold by auction in England in June, 1922, and realized very satisfactory prices.

(iv) *Statistics.*—The following tables will serve to illustrate the position of the industry and the advance which has taken place since 1910–11 :—

(i) BUTTER—PRODUCTION, IMPORTATION, AND CONSUMPTION, 1910–11 TO 1923–24.

Year.	Production.			Imports (less Re-Exports).	Exports (South African Produce).	Production (less Exports).	Available for Consumption.
	Creamery Butter.	Farm Butter.	Total.

5. **Sheep and Wool.**—(i) *History of Sheep-Breeding.*—Of the agricultural and pastoral industries of the Union the breeding of woolled sheep is the oldest and most important. The original Cape sheep, still bred to a large extent in South Africa, is a light, somewhat leggy animal covered with hair of varying hue, and with long, lopping ears. Another characteristic is a broad tail, composed principally of fat, and varying in weight from six to over ten pounds. In order to improve the native sheep, importations of rams and ewes from the best flocks in Holland were made by the Dutch East India Company in 1654, and numerous introductions of high-class stock from oversea subsequently took place. The next importation was in 1689, also by the Company, but this time from Spain. In 1790, Colonel Gordon, an officer in the Company's service, introduced a number of fine merino sheep of the *Escurial* breed. Other importations occurred at about this period, and later the breeding of woolled sheep was undertaken seriously. Introductions of sheep of *English* breeds were effected by the settlers of 1820, and purchases were afterwards made in Saxony and, still later, in France. Of late years there have been fairly large importations, chiefly from Australia. The present wool industry of the Union has been built up by the careful selection of rams and the breeding of pure merinos.

(ii) *Number of Sheep in the Union.*—The following tables show the number of sheep (woolled and others) in the country in the census years 1904 and 1911 and in succeeding years. In the years 1919, 1920, and 1922, when the annual census did not cover either the native areas or the towns, and in 1923 and 1924, when the censuses did not embrace the towns, the numbers as ascertained in 1918 and 1921 have been assumed and included for convenience of comparison.

SHEEP IN THE UNION, 1904 TO 1924.

(*a*) WOOLLED SHEEP.*

Year.	Cape of Good Hope.	Natal.	Transvaal.	Orange Free State.	Union.

(*b*) OTHER SHEEP.

1904	3,353,521	163,580	422,111	562,656	4,501,868
1911	6,082,677	414,235	1,084,946	1,232,586	8,814,444
†1912	6,022,147	295,090	1,206,251	1,034,266	8,557,754
†1913	5,188,939	357,866	1,220,563	712,725	7,480,093
†1915	3,886,782	406,034	811,786	385,672	5,490,274
†1916	3,847,311	372,547	877,596	392,727	5,490,181
1918	3,572,316	320,545	614,404	348,052	4,855,317
1919	4,217,267	329,163	662,607	521,830	5,730,867
1920	3,309,947	335,393	674,867	452,960	4,773,167
1921	3,109,489	221,449	408,010	233,351	3,972,299
1922	4,136,119	263,007	646,753	558,841	5,604,720
1923	4,082,646	318,112	649,047	544,722	5,594,527
1924	3,652,068	351,133	630,827	479,049	5,113,077

* In the classification of sheep there are marked differences in each census. This is due to the farmer confusing his woolled with his non-woolled sheep.

† Figures supplied by the Department of Agriculture.

(iii) *Sheep Flocks in Various Countries.*—The following table gives figures, extracted from a number of sources, showing the size of the sheep flocks of various countries at the most recent dates available in each case :—

SHEEP FLOCKS OF VARIOUS COUNTRIES.

Country.	Year.	Number of Sheep (Thousands).	Country.	Year.	Number of Sheep (Thousands).
Australia	1923	80,110	Greece	1921	5,789
Russia in Europe	1924	54,675	Germany	1924	5,717

Jugo-Slavia	1924	7,639			

(iv) *Wool Production.*—Almost the whole of the Union wool clip is shipped oversea, and the export returns therefore reflect practically the total production of the country. Details will be found in Chapter XVIII.

The following tables give (i) the production of wool in the Union as returned at the agricultural censuses for a series of census years, and (ii) world production for 1909–13, 1923, and 1924 :—

(i) PRODUCTION OF WOOL—AGRICULTURAL CENSUSES, 1917–18 TO 1923–24.

Year.	Cape.	Natal.	Transvaal.	Orange Free State.	Total.
	lb.	lb.	lb.	lb.	lb.
1917–18	64,473,000	5,758,000	13,396,700	40,708,500	124,336,200
1919–20*	66,924,450	5,798,830	14,484,950	44,827,650	132,035,880
1920–21	66,833,137	5,909,932	15,812,392	47,373,558	135,929,019
1921–22	71,349,877	5,660,092	15,147,762	47,895,218	140,052,949
1922–23	72,045,812	5,555,523	15,271,370	44,344,880	137,217,585
1923–24	77,674,058	6,204,061	15,910,541	48,076,833	147,865,493

* Not enumerated for 1918–19.

Note.—The discrepancy between the production and export figures (Chapter XVIII), plus the local consumption, is a phenomenon common also to Australia and America. The difference is apparently accounted for by wool pulled from slaughtered sheep and sheep which have died from disease, as also by wool shorn by speculators, figures in respect of which are not reflected in the production returns.

(ii) ESTIMATED WORLD PRODUCTION OF WOOL, 1909–13, 1923, AND 1924.

Country.	Average, 1909–13.	1923.	1924.

(v) *The South African Wool Market.*—In former days it was customary for South African sheep farmers to sell their wool or barter it to up-country storekeepers, merchants, or speculators, many of whom were supported by large mercantile or broking houses at the coast. These buyers then forwarded the wool to the coastal towns for disposal. The up-country purchasers cannot, in the majority of cases, be regarded as wool buyers in the strict sense of the word, as they lack the requisite knowledge and experience to estimate the quality and clean scoured yield of the wool. The wool is, therefore, bought by them simply at so much per lb. in the grease, the price paid being frequently not the true value of the wool. The majority of the sheep farmers, having realized this fact, now forward their wool direct to wool brokers at the coast, who sell the wool on a commission basis, but there is still much room for improvement as a large number of farmers, mostly small holders, still persist in the bartering system.

The systems of selling wool in vogue at the different ports are not uniform. In Durban all wool must in the first instance be offered for sale on public catalogue sales. If the reserve price is not reached and the wool is declared unsold, the highest bidder has the option until the following day of taking over the wool if desired, but should he not avail himself of this option, the wool may be sold by private treaty between the broker and the buyers. In Port Elizabeth, wool is sold either by private treaty or on public catalogue sales, but there is no compulsion as in Durban first to offer it at the public sales. In East London and Cape Town, wool is at present sold only by private treaty between the brokers and the buyers. Previous to the European War public sales were held in East London, and have since been resumed.

In certain up-country towns in the Western Province of the Cape, viz., Swellendam Heidelberg, Riversdale, Caledon, and also the coast town of Mossel Bay, one public sale per annum is held, comprising the various clips grown in those districts. The custom of holding these annual sales has been in vogue for many years. Periodical public wool sales have been started lately in Bloemfontein and other places in the Orange Free State.

In the year 1917, the Imperial Government made an offer to purchase the whole of the South African wool clip of the season 1917–18 on a schedule of prices based as nearly as possible on 55 per cent. above the ruling prices in 1913–14. The Imperial Government further proposed that if wool prices fell, they would bear the whole financial loss, but if a profit was made, it would be shared equally between the Imperial and Union Governments.

The offer was considered a most favourable one and was accepted on the condition that those growers who wished to participate in the scheme should register their clips. The effect of this offer was a rapid rise in the wool market as far as extra super wools were concerned, and it is necessary to review, briefly, the state of the market at that time. The early months of 1917 witnessed a falling market owing to a serious scarcity of freight. About February, most of the firms operating for the United Kingdom gradually stopped buying owing to shipping difficulties, and consequently prices began to fall rapidly. Large stocks accumulated at the ports for which there was little or no demand, and the market was saved by the fact becoming known that the British Government was negotiating for the purchase of the whole South African clip of the 1917–18 season.

The participation of the United States in the European War necessitated increased purchases of wool for their requirements, so that they became active operators in the South African market.

The Japanese, who up to 1916 had purchased only 245 bales in South Africa, on finding the whole of the Australian clip sold to the Imperial Government, began to send in extensive orders, buying largely for future deliveries and thereby creating a boom in the market as far as extra super wools were concerned. In view of this improvement in the market many farmers who had registered their clips withdrew from the scheme and sold their wool in the open market. The Imperial Government renewed their offer in regard to the 1918–19 season's clip, but so little support was forthcoming that the offer was withdrawn.

After the boom referred to above a great depression in the wool trade set in and there is no doubt that if the South African farmers had accepted the Imperial Government's offer for a period of five years as was done in Australia, they would have benefited thereby and their acceptance would have created a greater stability in the wool market.

There has been a great deal of fluctuation in the wool market from time to time. The average price paid for grease wool gradually rose from 6·01d. per lb. in 1908 to 29·30d. in 1920. A set-back has taken place since. The average price paid in 1921 was 7·90d. per lb., while in 1922 it rose to 11·93d., 1923 to 17·20d., and 1924 to 20·40d. With the development of a tendency towards a world shortage in the supplies of wool, the price moved still further upwards in subsequent years.

During the great wool boom at the end of 1919 and early parts of 1920, as much at 85d. per lb. was paid for grease wool, but shortly afterwards a slump set in. Towards the end of 1920 the market became dead, and farmers were unable to dispose of their wool. With a view to assisting the farming community, the Government endeavoured to find a market in Germany, but the negotiations failed. Subsequently, the Imperial Government was induced to buy up to 100,000 bales of the unsold portion of 1919–20 clip at the 1913–14 season's prices. These prices were considered very good and were considerably above the nominal market prices for the lower types of wool. The Government Wool Scheme was commenced in April, 1921, and since then gradual improvement in the market has taken place and towards the end of the 1921–22 season all old stocks of wool had been sold and shipped. Half the realized profits, amounting to £99,855, were paid over by the Imperial Government to the Union Government for distribution among those who had participated in the scheme. After allowing for £19,773 paid out in expenses, a sum of £80,082 was distributed.

A great improvement in the quality of the South African wool has been brought about during recent years through judicious classing and mating of sheep, and much good work has been done by the sheep and wool experts of the Agricultural Department in advising farmers in this direction. An improvement has also taken place in the classing and get-up of the clips so as to make these more attractive to buyers when the wool is displayed for sale. For the purpose of improving the quality of the wool and disposing of it to the best advantage, many Wool Growers' Associations have recently been established. The work of these associations will no doubt benefit the farmers in general, and do much towards gaining the confidence of the buyers as to the quality of the wool packed when it is offered for sale.

(vi) *Export of Sheep Skins.*—A considerable trade in sheep skins also is carried on. Details will be found in Chapter XVIII.

(vii) *Mutton.*—It was formerly necessary to import large quantities of mutton for consumption within the Union, but the importations during the period of the war dwindled to negligible dimensions; and though the imports in 1920 almost reached the pre-War level, the upward movement was subsequently not maintained.

6. **Goats and Mohair.**—(i) *Number and Classification of Goats.*—The tables hereunder give information as to the number of goats in the Union, distinguishing Angora goats from others. Owing to the fact that at the agricultural censuses of 1919, 1920, and 1922, goats in native areas and towns, and at the 1923 and 1924 censuses in towns, were not enumerated, it has been necessary to assume in respect of these years a number calculated from the nearest census, and to include this number in the tables for convenience of comparison.

GOATS IN THE UNION, 1904 TO 1924.

(*a*) ANGORA GOATS.

Year.	Cape of Good Hope.	Natal.	Transvaal.	Orange Free State.	Union.

(ii) *The Angora Goat.*—In 1838 Colonel Henderson imported twelve rams and one ewe. The rams were said to have been rendered impotent before they left Angora, and only one male born en route proved perfect. This can be said to have been the first importation. The second importation was made by Messrs. Mosenthal in 1856. Further importations were made by others in 1857, 1860, 1868, 1870, 1871, 1880, and 1897. So much intelligent care was bestowed on and so much industry applied to the breeding of Angoras that in 1891 there were approximately 3,000,000 in the country, and some of the specimens were regarded as superior to any goats produced in Turkey.

The severe drought which visited the country during the few years prior to 1916, especially in the districts devoted largely to the raising of Angoras, is mainly responsible for the falling off in the number of Angora goats raised since 1911.

(iii) *Production of Mohair.*—As in the case of wool, practically all mohair is shipped oversea, and the export returns may be taken substantially as indicating the production of this article in the Union. Details will be found in Chapter XVIII.

The following table shows the production of mohair in the Union, as returned at the agricultural censuses of 1917–18, 1919–20, 1920–21, 1921–22, 1922–23, and 1923–24 :—

PRODUCTION OF MOHAIR—AGRICULTURAL CENSUSES, 1917–18 TO 1923–24.

Year.	Cape.	Natal.	Transvaal.	Orange Free State.	Total.
	lb.	lb.	lb.	lb.	lb.
1917–18.....	9,614,100	136,900	211,500	422,600	10,385,100
*1919–20.....	7,548,410	94,650	125,400	330,700	8,099,160
1920–21.....	7,905,206	93,004	117,556	332,784	8,448,550
1921–22.....	8,135,740	72,154	88,746	326,454	8,623,094
1922–23.....	9,073,154	63,425	66,099	251,871	9,454,549
1923–24.....	7,762,064	60,927	50,372	225,731	8,099,094

* Not enumerated for 1918–19.

(iv) *Trade in Mohair.*—To a certain extent the supply of mohair exceeds the demand, and the sale is confined almost entirely to the Bradford market, where it is spun into yarn and distributed. Until Turkey entered the European War, that country was the greatest

competitor with the Union in the supply of mohair. In 1865, when the mohair exported from South Africa amounted to 9,609 lb., the amount exported to the United Kingdom from Turkey totalled 2,421,188 lb.

By the year 1887 a greater quantity of mohair was being exported to the United Kingdom from South Africa than from Turkey—8,756,116 lb. as against 6,714,816 lb.—and since that year the Turkish export has only twice exceeded that of South Africa—in 1895 and in 1898. Since 1907 the annual South African output to the United Kingdom has been nearly double that of Turkey, and the lead has been maintained notwithstanding that average Turkish mohair commanded some 2d. to 3d. per lb. more than that from South Africa. The exceptional advance made in regard to other pastoral industries in the last decade did not, however, occur in the case of mohair; for, as already stated, mohair is an article for which there is a limited demand, and the stimulus to the production of such commodities as wool, dairy produce, and ostrich feathers which came with the conclusion of the Anglo-Boer War slackened in respect of mohair as soon as the country had reached the limit of successful competition with Turkey for the world's consumption of about 30,000,000 lb. per annum, of which South Africa produces more than half.

(v) *The South African Goat.*—The common goat was found to be in the possession of the natives of the Cape of Good Hope when the country was first occupied by Europeans. This animal was, however, very inferior to the common goat of the country as it exists at the present day. Improvement in size and appearance has been effected by breeding. At present South African goats are bred principally in the dry Karroo districts to the north and north-west of the Cape Province, in the various native areas, and in the bush country where sheep do not thrive. These goats are hardy animals, grow to a considerable size, and multiply rapidly; hence they are the most profitable stock which can be raised in districts where there is a demand for their mutton.

(vi) *Trade in Goat Skins.*—Practically all the goat skins available for sale are exported oversea. Details will be found in Chapter XVIII.

7. **Pig and Bacon Industry.**—(i) *Development and Potentialities.*—In so far as the development of the pig industry in South Africa is concerned, progress has been somewhat slow. During recent years there has actually been a decrease in respect of numbers, but an appreciable improvement in quality and type. The commercial side of pig farming is undoubtedly receiving far more serious consideration, though progress in this respect must of necessity be gradual owing to the vastness of the country; also to the lack of transport, and other facilities. There is no doubt that the development is as yet far from being commensurate with the immense potentialities of the industry. The natural resources of the country, such as its equable climate, freedom from the more serious swine diseases, cheap labour, and the production of large quantities of maize, lucerne, and milk by-products, all warrant pig farming being undertaken, on a small scale at least, in various parts of the Union on a profitable basis.

(ii) *Number of Pigs.*—Particulars are given hereunder as to the number of pigs in the Union. Owing to the fact that the agricultural censuses of 1919, 1920, and 1922 did not include either the native areas or towns, also that the censuses for 1923 and 1924 did not include towns, the number of pigs in these areas has been estimated for the years in question from figures of the nearest census and have been included in the following table for convenience and comparison:—

NUMBER OF PIGS IN EACH PROVINCE, 1904 TO 1924.

Year.	Cape of Good Hope.	Natal.	Transvaal.	Orange Free State.	Total.
1904.....	385,945	75,887	155,843	61,409	679,084
1911.....	505,730	110,332	302,882	162,656	1,081,600
1918.....	537,896	119,153	240,750	145,425	1,043,224
1919.....	582,537	127,882	275,949	173,468	1,159,836
1920.....	491,613	129,751	267,119	107,501	995,984
1921.....	448,166	120,989	249,063	96,551	914,769
1922.....	475,584	124,538	238,435	102,387	940,944
1923.....	405,673	130,449	256,324	121,555	914,001
1924.....	378,918	109,733	234,205	101,613	824,469

(iii) *Present Position of the Industry.*—It is due largely to a number of carefully selected importations, also to a certain amount of systematic breeding and feeding, and improvement in management generally, that the standard of bacon pig produced in the various Provinces of the Union has been appreciably raised during recent years. The facilities provided under the present Ocean Mail Contract for the free conveyance of pedigree stock have been the

means of increasing the importations of pigs into the Union, but it is regretted that ful advantage has not been taken of these facilities during the past few years. It is true that in most cases the type of animal imported for breeding purposes has been well suited to the conditions of the country, but unfortunately quite a number of these animals have been excessively fat and therefore their condition has been prejudicial to their usefulness as breeding stock. It is an interesting fact that there has also been considerable improvement in the equipment of the bacon factories that are established to-day in the different parts of the country. This should prove an incentive to stimulate increased production. Despite these improvements it is generally recognized that the improvement in the type of bacon pig marketed has not kept pace with the facilities available for the production of a considerable amount of prime quality bacon.

The following tables give particulars as to the Union's production, imports, and exports of bacon, ham, and lard:—

(*a*) BACON, HAM, AND LARD—PRODUCTION, 1915–16 TO 1923–24.

* Imports—21,490 lb., value £1.115; Re-exports—33,531 lb., value £1,967.

Between the years 1913 to 1920 the industry continued to make fairly satisfactory progress. Since the latter date, however, there has been a very noticeable decrease in the export bacon and ham trade, due primarily to competition in the overseas markets having become normal again after the European War. During the boom period of 1919-21, a large number of bacon factories, most of them comparatively small local concerns, were established in different parts of the Union. The subsequent slump in the price of bacon on the overseas markets during the years 1922–23 compelled many of these smaller factories to close down. This enabled the larger factories, which were better able to weather the storm, to increase

their killings and so reduce their overhead charges in respect of the number of pigs handled. The bacon industry appears to-day to be once more stabilized, and it is reasonable to suppose that the bumper maize harvest that is expected this year, together with the fact that increased protection on imported bacon and ham has recently been given to the industry by the Government, will enable pig breeders in the Union to meet, at least, the necessary requirements of the South African trade and possibly even again to consider the building up of an export trade.

Of the imported breeds, *Large Blacks* are still produced in the largest numbers. In parts of the Union, particularly in Natal, *Middle Whites* have been taken up by a number of breeders and are for the most part being used for crossing with *Large Blacks* and *Tamworths* for the production of baconers. The *Berkshire* (boar)-*Large Black* (sow) cross is the most universal cross used for the production of baconers. The *Tamworth* (boar)-*Large Black* (sow) cross has been gaining ground and to a lesser extent the *Large White* boar has been used for crossing with both *Large Black* and *Tamworth* sows. The lean, sizable Wiltshire side is in most demand in so far as the South African trade is concerned. There is a ready market for heavy and extra heavy Wiltshire sides in the North of England, though an export trade in this class of bacon can only be considered provided the cost of production locally is sufficiently low to allow of its being a profitable undertaking. The production of baconers has in the hands of certain breeders and feeders attained a high standard of excellence. Pens of baconers are annually exhibited at the more important shows throughout the Union, and in point of merit these pigs compare favourably with the best baconers that are produced in any part of the world. The prizes won by South African bacon factories for bacon exhibited in competition overseas demonstrate clearly that the Union is able to produce bacon of prime quality. The general standard, however, leaves much to be desired.

The registration of all pedigree pigs is performed by the Pig Breeders' Society of South Africa. This body is a live concern and is doing everything in its power to promote the interests of the pig industry. Advice and literature are given gratis, on application to the Secretary, P.O. Box 703, Cape Town. Although pig breeders in the Union are not as yet properly organized, local societies are gradually being formed in various parts of the country.

The marketing of pigs, owing to a lack of proper organization, has not been satisfactory, despite the fact that the average prices obtained during the past year have allowed of profits being made which compare favourably with those in other lines of farming in South Africa. The bacon factories in 1924 paid an average price of 6½d. per lb. for prime baconers, while open-market prices have at times been considerably higher, 8½d. being touched on a few occasions. Porkers are in good demand, the average price obtained being in the neighbourhood of 5d. per lb. live weight for well-finished pigs of good quality.

Pure-bred weaners, representative of the recognized breeds, can ordinarily be obtained at from £3. 3s. upwards, whilst gilts and boars of breeding age, i.e. eight months and over, are obtainable at prices ranging from £8. 8s. and upwards.

8. **Ostrich Farming.**—(i) *Natural Condition of Ostriches.*—The ostrich in its natural state at one time abounded all over the habitable parts of Africa, and was regularly hunted for its plumes. Had not its domestication been undertaken it would doubtless have become extinct as a result of the increase of population and the gradual agricultural development of the country. As it is, wild ostriches are still to be found in certain parts, while the birds kept on farms have greatly increased, numbering about 776,000 in 1913, but since reduced by more than half as a consequence of the war. Ostrich farming was first seriously undertaken in South Africa about fifty years ago, and the export of plumes from domesticated birds increased rapidly, soon outweighing that of plumes from the wild birds. At the present time the feathers from the latter are a negligible quantity.

(ii) *Ostrich Domestication.*—The ostrich proved itself readily amenable to farming methods and was found to breed freely under restraint. The industry was very remunerative and rapidly developed into one of the principal agricultural activities of the Cape Colony. Within fifty years the ostrich, wild and highly nervous, has been reduced to a thorough state of domestication. The details of management required for the production of successive plumage crops of the highest perfection have been worked out, and the few parasitic diseases to which the bird is subject have been combated. Methods of chick-rearing have been elaborated, and by selective breeding the plume has been brought to a high state of perfection. One fact which has been fully demonstrated is the highly sensitive nature of the feather growth. Unless the bird is maintained in the highest condition of nutrition during the six months required for a feather crop to grow and mature the character and quality of the plumage suffer. Any imperfection of growth greatly depreciates the plume, often rendering it almost valueless. Only certain districts of the Union, on account of peculiarities of soil and climate, are found to be favourable to the production of plumes of the highest type. The restraining of the bird within farm limits has led to an extensive system of wire-fencing. The necessity for high feeding has resulted in the laying down of crops, particularly lucerne, which has involved the construction of numerous systems of irrigation.

(iii) *Statistics.*—The high returns from the sale of feathers and birds were in practically all cases devoted to general farm improvement, and the ostrich districts progressed rapidly. Pairs of breeding birds, one cock and one hen, were occasionally sold for as much as £1,000, and the prices obtained for chicks varied from £5 to £50, according to the quality of their plumage. The clipping of feathers from a single bird fluctuated in value from £1 to £20. No cruelty whatever is involved in procuring the feathers. The clipping of the ripe plumes means no more to the bird than does shearing to a sheep, a humane consideration which has undoubdtely added to the success of the trade. The output has steadily increased. In 1913 the industry attained its highest point of success, the weight of the feathers exported from the Union during that year reaching the total of 1,023,307 lb. valued at £2,953,587, and representing an average value of £2. 17s. 9d. per lb. As the result of a combination of causes, but principally of over-production, a set-back in prices and in demand eventuated towards the end of 1913, which, with the outbreak of war in 1914, brought about an almost total collapse of the feather trade. Prices fell to as low an average as 15s. per lb., and the quantity exported to less than a fourth that of normal times. This consequence of the war was natural and unavoidable in the case of an article of luxury, and for the past few years ostrich farmers have suffered greatly. Many have taken to other branches of farming, so that no farmer is now wholly dependent upon ostriches as a means of livelihood. The number of ostriches throughout the country has been reduced by more than half, only birds of superior plumage having been retained against the restoration of more settled economic conditions.

With the signing of the Armistice towards the close of 1918, and later the release of vessels for exportation, the feather industry underwent a rapid revival. Before the middle of 1919 prices had been restored to a basis which again made ostrich farming a paying proposition, but since that time the prices have steadily fallen, owing to the general financial depression and unsatisfactory exchange rates which ensued after the War. Farmers have had a severe lesson in the great slump which existed all through the War and since, and the prices of good breeding birds and chicks have not risen to anywhere near the figure they realized prior to this period.

In order to provide funds for the rehabilitation and organization of the ostrich feather industry, a levy of 2 per cent. on the declared value of ostrich feathers exported from the Union was instituted from the 1st September, 1923.

The following table shows the number of ostriches in the Union at the dates specified :—

NUMBER OF OSTRICHES IN EACH PROVINCE, 1904 TO 1924.

Year.	Cape of Good Hope.	Natal.	Transvaal.	Orange Free State.	Union.
1904 (General Census).....	357,970	1,523	14	1,323	360,830
1911 (General Census).....	728,087	4,111	5,441	9,097	746,736
1913 (31st December).....	756,923	5,081	4,591	9,718	776,313
1916 (30th June).....	379,427	4,259	8,927	6,415	399,028
1918 (Census of Agriculture)...	300,906	6,022	3,110	4,227	314,265
1919 (30th April).....	273,490	1,900	2,820	3,860	282,070
1920 (30th April).....	277,700	1,670	2,450	2,160	283,980
1921* (30th April).....	255,661	1,468	2,840	1,859	261,828
1922 (30th April).....	263,971	937	1,402	2,068	268,378
1923 (31st August).....	238,830	635	890	747	241,102
1924 (31st August).....	204,388	671	850	876	206,785

* A table classifying the various types of ostriches in the Union at the 30th April, 1921, is given in the sixth issue of this *Year Book*.

A table showing the quantity and value of ostrich feathers exported from the Union will be found in Chapter XVIII.

9. **Poultry.**—During the past fifteen years poultry keeping has developed enormously in South Africa, and this expansion has taken place entirely on commercial lines, for it is now realized as a basic fact that egg-production can be made a payable proposition, provided the business is conducted on sound commercial lines and costs of production reduced to the lowest possible figure commensurate with efficiency.

Until recently, the tendency was for commercial egg farms to be located near to the larger consuming centres, but within the past five years several large commercial plants have been established in various parts of the country remote from the larger towns, whilst year by year the farmers throughout the Union are realizing that it is the hen which brings in the monthly cheque which is so useful in meeting current expenses. But there are still a very large number of farmers, especially those operating on a small scale, who live on credit during the greater part of the year, relying on the returns from their crops to liquidate the account. Had these kept a flock of 100 to 200 laying hens the monthly cheque derived from these would have gone a long way towards meeting the local store account, and thus left the returns from the crops practically intact.

With the establishment of egg circles in every Province of the Union, the difficulties of marketing poultry produce to the best advantage have been removed. By joining such bodies, the producer has only to rail his eggs regularly and frequently, and the circle disposes of them to the best advantage and posts a regular monthly cheque.

The method of selling eggs by barter through the medium of the local storekeeper can never yield a satisfactory return to the producer, for only the lowest valuation is allowed for the eggs, and goods are supplied to the extent of such valuation; thus, the storekeeper reaps a double advantage by making a profit on his goods and also on the eggs which he accepts in exchange.

The export of eggs from South Africa is steadily increasing, and as our plentiful season of production coincides with the period of scarcity in Europe, there is a ready market oversea for the whole of our surplus. Our first export took place in 1914, when 1,927 cases—each containing 30 dozen eggs—were shipped to London. This has continued annually until in 1924 the export figure reached 76,281 cases. The rapid growth in the quantity of eggs handled by egg circles will be realized from the following figures :—In 1922 only 2·9 per cent. of the eggs exported from South Africa were shipped by egg circles. In 1923 this figure rose to 10·8 per cent., whilst in 1924, egg circles shipped 13·4 per cent. of the total export, and it is expected that a still further advance will be recorded during the 1925 export season. In 1922 a levy of 9d. per case was placed upon all eggs exported from the Union, the proceeds being devoted to the development of the industry. The establishment of this fund enabled the dispatch of a poultry officer to England in 1924 with a view to obtaining the most up-to-date information in regard to marketing and opening up fresh markets for South African poultry produce.

The report of Mr. A. Owen-John on his investigations during his recent visit to England and the Continent has been published in the Agricultural Press and affords most instructive and interesting reading. The suggestions contained therein as to improved methods of marketing are being carried into effect and will doubtless have a wide-reaching and beneficial effect on the industry.

The following table gives particulars of the poultry owned in the Union, as ascertained at recent censuses :—

NUMBER OF POULTRY IN EACH PROVINCE, CENSUS OF 1921 AND ON 30th APRIL, 1922.

Province.	Fowls.		Ducks.		Geese.		Turkeys.	
	1921.	1922.	1921.	1922.	1921.	1922.	1921.	1922.
Cape	3,730,058	3,845,683	117,755	139,129	90,789	90,050	83,956	89,731
Natal	1,650,927	1,521,752	59,582	63,367	10,243	8,239	14,843	15,073
Transvaal	2,743,847	2,649,654	105,003	124,516	54,450	52,250	62,850	71,223
Orange Free State	1,293,699	1,164,735	74,292	88,798	60,908	53,699	74,023	86,514
TOTAL	9,418,531	9,181,824	356,632	415,810	216,390	204,238	235,672	262,541

10. **Bees.**—The Union Government has an official on its professional staff whose special duty it is to give advice on bee-keeping matters. Bee-keeping could, no doubt, be expanded greatly and profitably in the Union, the demand for hive products being considerably in excess of the supply. At the present time large quantities of beeswax are imported from Central and East Africa. With the object of minimizing the risk of introducing disease, the Union, in common with Rhodesia and Portuguese East Africa, prohibits the importation of honey and reserves to the Government exclusively the right to import bees. For many years bees have not been admitted. The importation of beeswax and foundation comb is allowed only under special permit, and is conditional on the wax having been subjected to prolonged heating. The prohibition of the importation of honey, combined with meagre production here, renders the price of this article in the Union very high. Until the latter part of 1917 South Africa was supposed to be free of infectious bee brood diseases. European foul brood and sacbrood have since become recognized in all four Provinces of the Union, but they are not known to cause serious loss in any part of the country, and, in general, they escape even the observation of the owners of the infected colonies.

The table hereunder gives particulars as to the production of honey in the Union :—

PRODUCTION OF HONEY IN THE UNION, 1911, 1918, AND 1921.

Description.	Cape of Good Hope.	Natal.	Transvaal.	Orange Free State.	Union.

* Native Locations and Reserves not included.

11. **Losses of Stock from Drought and Disease.**—In September, 1920, a Commission was appointed to investigate the important question of drought. The Commission, which consisted of Messrs. H. S. du Toit, D.T.D. (Chairman), S. M. Gadd, G. A. Kolbe, A. Stead, B.Sc., F.C.S., and R. J. van Reenen, B.A., C.E., A.M.I.C.E., was instructed to inquire into and report upon :

(1) the methods by which losses to farmers owing to periodic droughts in the drier parts of the Union may be prevented, either by public or private action ; and in particular whether any changes in farming methods are necessary for this purpose ;
(2) any improvements in farming conditions generally, such as the provision of more water, prevention of soil erosion, and any other matters which have a close bearing on point (1) ;
(3) the methods by which indigency arising among the farming community in consequence of such losses could best be dealt with ;
(4) the production of stock-feed by the cultivation of various grasses.

The first report of the Commission, submitted in April, 1922, was summarized in the sixth issue of this *Year Book*. Its final report, published in June, 1924—a voluminous and important State document—emphasized the conclusions recorded in the interim report. The following summary of the contents should be read in conjunction with the terms of reference given above :—

(1) *Changes in Farming Methods.*—The most pressing and necessary change in farming methods is the abolition of the usually practised kraaling of stock and its substitution by the paddocking system. Kraaling is detrimental to the veld as well as to stock ; it leads to a diminished efficiency of rainfall, which is a much greater menace than a decreased rainfall. Complete grazing control through an efficient system of paddocks should be the goal ; but an efficient paddock system demands the provision of an adequate and pure water supply. The reduction of drought losses should lead to improvement in the breed of animals. Over-stocking is bad farming. Farmers should accumulate fodder reserves for drought periods. Wind-breaks and shade do much to assist in maintaining stock. It is calculated that the income of the Union from wool alone would be doubled if the paddock system were generally adopted, while if all phases of the small stock industry be taken into account, the annual increased return, capitalized at even 10 per cent., would very nearly equal the fixed property valuation of the Cape Province. There is room for much improvement in the economic use of water.

(2) *General Improvement in Farming Conditions.*—The improvements outlined in the previous paragraph require the alteration of certain general conditions, to bring about which is beyond the powers of the individual farmer. For example, the jackal is responsible for much of the faulty small-stock farming, and he must be got under control or even be exterminated. The rapid adoption of the paddock system would be facilitated by making cheap fencing material available and by minor alterations in the fencing law. The farmer should be encouraged to develop the water resources of his farm. Stock thefts should be discouraged. The failure to realize the benefits that would accrue from the better methods of farming is a reason preventing their adoption, an obstacle which educational effort would do much to remove. In this the organization of farmers would greatly assist, and for the achievement of this end the State should detail suitable officers. Farmers' organizations will ease matters during droughts. Improvements of transport facilities and generally improved market facilities will greatly ameliorate the farming conditions. Drought losses could be diminished if reliable seasonal forecasts were possible : the Government should appoint a committee of experts to determine what steps should be taken to obtain such forecasts. The provision of cold storage and of factories for making meat products would assist in the more economical use of the veld by enabling the farmer to dispose of his stock when in good condition. Deterioration of the vegetal cover and the resulting soil erosion are doing much damage and seem to be main causes of the decreasing European population in the Cape Midlands. The soil is an irreplaceable national asset. The State should therefore actively assume its responsibilities in connection with the conservation thereof by appointing a *reclamation officer*. Veld burning as practised is detrimental to the country, but cannot be stopped by legislation. In most cases education will be the only deterrent ; but it is considered that in certain areas of high value as catchments feeding irrigation works, the prohibition of grazing would lead to the cessation of veld fires. Evaporation plays a very important rôle in the social economy of the Union ; probably many times the quantity of water which finds its way to the sea by rivers is lost in unproductive evaporation, which would be reduced by the maintenance

of an efficient vegetal cover, and through that, the prevention of soil erosion. Irrigation, though definitely limited in extent by the run-off of rainfall, topography, soil, and financial factors, will always be an important aid to crop raising and stock farming. Through deterioration of the vegetal cover and soil erosion, the efficiency of the catchments of most rivers used for irrigation is decreasing. The State should direct the preservation and reclamation of those catchments, which relatively and luckily are small. Since the silting up of dams is beyond the control of the irrigator, the State should assist *inter alia* by aiding farmers to paddock and by preventing soil erosion. Afforestation with suitable species for improving the head-waters of our rivers and their tributaries, and for other reasons, is to be recommended. The study of insect and other pests and of weeds which reduce the grazing yield should be undertaken by the State. The State should also make preparations to establish "fodder banks."

(3) *Indigency.*—Drought and other causes work together in producing indigency. The general improvement of conditions will decrease poverty, which is most intense after droughts. Education and the improvement of transport and market facilities are needed. Climatic and genetic conditions should also be considered.

(4) *Production of Grass Feed.*—Usually farmers make no provision for droughts. They should do so by sparing veld, making hay, by growing fodder crops (including spineless cactus), and crops for making ensilage. They should also establish "fodder banks." The Department of Agriculture should carry out certain investigations with reference to fodder plants.

The following table indicates the extent of the losses suffered by farmers in the Union from the death of stock in consequence of disease and drought, as shown in the returns of the agricultural censuses of 1922–23 and 1923–24 :—

DEATHS OF STOCK FROM DISEASES AND DROUGHT DURING YEARS 1922–23 AND 1923–24.

Description.	1922–23.				1923–24.			
	From Disease and Drought.	*Killed by Vermin.	*Stolen or Missing.	From All Causes.	From Disease and Drought.	*Killed by Vermin.	*Stolen or Missing.	From All Causes.
Cattle.....	733,577	—	—	733,577	746,208	—	—	746,208
Sheep..... Lambs..... Goats..... Kids.....	6,090,324	345,004	510,108	6,945,436	4,046,980	303,997	404,306	4,755,283

* Not enumerated in Native Reserves, etc.

NOTE.—Returns received at the agricultural censuses for 1921–22, 1922–23, and 1923–24 show that the following crop losses were sustained by farmers in the Union through damage by hail :—1921–22, £867,353 ; 1922–23, £549,599 ; 1923–24, £513,679.

12. **Transportation of Live Stock.**—A Departmental Commission was appointed by the Railways and Harbours Administration in August, 1923, to investigate and report upon the transit of live stock, other matters incidental to the conveyance of live stock by rail, and the development of the export meat traffic.

The terms of reference were :—

(*a*) The possibility of effecting improvements in the transit of live stock by means of through services and special facilities on branch lines.
(*b*) The desirability of extending running block load trains on certain fixed days.
(*c*) Whether live stock should not be conveyed direct to destination without detraining en route.
(*d*) The most suitable type of truck.
(*e*) Feeding and watering either in trucks or at stipulated points en route, and necessary appliances accommodation and charges therefor.
(*f*) Cleaning and disinfecting of cattle trucks and necessary facilities for accommodation and charges therefor.
(*g*) Electric or other prodders for assisting in loading of animals.
(*h*) Standard type of loading pen and ramp, and the best method of loading.
(*i*) Development of export meat traffic ; whether to be conveyed from inland to coast frozen or chilled, and type of insulated or refrigerated cars therefor.
(*j*) Periodical inspection of live stock en route by qualified official.
(*k*) Dehorning of cattle to minimize injury and cruelty.
(*l*) Delivery to consignees of stock at sale centres on Saturdays, Sundays, and public holidays.

The Commission, which was representative of various interests, reported on the 7th November, 1923.

Following on the report of the Commission, the Railways Administration instituted various improvements in the transportation of live stock, including a system of special fast live stock trains which commenced running in June, 1924.

§ 3. Cereals.

A.—General.

1. **Cultivation of Cereals.**—Wheat, rye, oats, and barley are commonly designated "winter cereals" because they are almost exclusively grown during the winter months within the limits of the Union. The types grown, however, are relatively early maturing and correspond to the spring types of the Northern Hemisphere. The Union produces sufficient oats, rye, and barley to meet its own needs. The produce from fully half the acreage annually seeded to these crops is consumed in the form of hay, soiling, and grazing crops. The amount of wheat produced averages around 70 per cent. of the requirements of the country, which are estimated at 12,000,000 bushels. The remaining 30 per cent. is imported. The South African wheat market is thus largely influenced by the price of wheat overseas.

Early in the development of the Cape Colony the south-western coastal districts became recognized as the granary of South Africa because of their climate. At the present time they produce 40 per cent. of the wheat crop and larger proportions of the rye, oat, and barley crops. Secondary areas of production are the central north-east Cape and the north-eastern Orange Free State.

Wheat, oats, and barley seed is now usually treated for smut prior to sowing, so that the resulting grain crops are fairly free from this trouble. Rust occasionally does considerable damage to both the wheat and the oat crops, and attention is being directed to breeding resistant strains.

The following table shows the average area of land in the Union sown to the different winter cereals each year :—

AREA SOWN TO WINTER CEREALS IN THE UNION—AVERAGE—1918 TO 1923.

Crop.	Morgen.	Per Cent. of Total Winter Cereal Area.
		%
Wheat	430,690	47·5
Oats	333,274	36·7
Rye	87,053	9·6
Barley	55,619	6·2
TOTAL	906,636	100

2. **Wheat.**—In the western part of the Cape Province all areas are not equally well adapted for wheat growing. In the Darling, Malmesbury, and Piquetberg neighbourhoods practically all available land is devoted to the cultivation of cereals. The return obtained is lower and less remunerative than in the districts of Caledon and Bredasdorp. The average return over the whole south-west Cape is about 12 bushels per acre. The low yield secured is due to a low fertility of the soil and in part to insufficient culture of the ground. In the central north-east Cape and in the north-eastern Orange Free State, wheat production fits in well with the general type of mixed farming as a winter dry land crop. In these areas the cost of production is generally lower than in the south-western Cape, but the crop is less certain. A considerable quantity of wheat of superior quality is also produced under irrigation in the Transvaal and in limited areas in the Karroo. This supply is generally devoted to local requirements and will be maintained only as long as the market conditions justify wheat growing.

In the culture of wheat, double-furrow and three-furrow ploughs are in general use. The grain is either sown broadcast and ploughed or harrowed in, or else drilled in. Better returns are obtained from the latter practice. The rotation generally practised is wheat, oats, oats for hay, fallow for grazing (ouland), cultivated fallow (brakland). In the western section where the soils are more depleted, the land is left fallow for an extra year, or one of the oat crops is eliminated.

The use of fertilizers has become general. The standard dressing consists of a mixture of Government guano (see § 11) and superphosphate applied at the rate of 150–250 lb. per acre. South African soils are notoriously deficient in phosphoric acid, and in the winter rainfall area, in lime also, and to a less extent in potash, while owing to the effect of the

very dry summers in the chief producing area in preventing the accumulation of organic matter, and the effect of wet winters in leaching out of the soil such nitrates as are produced, the need for nitrogen is one which cannot be disregarded. Progress is being made towards obtaining a suitable legume crop for ploughing under as a green manure, with a view to improving the fertility of the wheat growing areas.

Sowing takes place from April until June ; harvesting occurs in November and December. The early varieties of wheat tiller badly and require a thicker seeding. Such varieties are usually seeded at the rate of about 40–50 lb. per acre, while in Great Britain seeding is usually at the rate of 2 bushels (120 lb.) per acre or more, showing that local experience has found a thin seeding to be all that the soil can nourish to maturity. Attention is being directed at the Government Experiment Stations to the production of more prolific strains and to a system of rotation which will maintain and improve the fertility of the soil.

The older varieties such as *Gluyas Early, Spring Early,* and *Rieti* are gradually being displaced by new hybrids and selections produced at the Government Experiment Stations. The most successful of these are *Union* 17 and *Union* 52 among the early wheats, *Kleintrou* and *Darlvan* among the mid-season wheats, and *Bobriet* and *Gluriet* among the late wheats.

Harvesting is generally done by means of the self-binder, and harvesting operations are seldom delayed through bad weather. Thrashing is generally completed in January or February, and the grain marketed soon after. Good markets exist for properly graded wheat.

The following table shows the area sown to wheat in the different Provinces in 1923 :—

AREA SOWN TO WHEAT IN THE DIFFERENT PROVINCES, 1923.

Province.	Morgen.	Per Cent. of Total Sown Area.
		%
Cape	316,663	77·4
Orange Free State	55,546	13·6
Transvaal	35,960	8·8
Natal	698	0·2
TOTAL	408,867	100

The following tables give particulars regarding the production, importation, and consumption of (1) wheat, and (2) wheaten flour and meal from the year 1910–11 to 1923–24. All available information has been utilized in the preparation of the tables, proportionate figures being interpolated in cases where information is incomplete or not available :—

(i) **WHEAT—PRODUCTION, IMPORTATION, AND CONSUMPTION, 1910–11 TO 1923–24.**

Year.	Total. Production.	Total Production (less Exports).	Imports (less Re-exports.)	Retained or Available for Consumption.	Wheat Ground as Flour and Meal.
	1,000 lb.	1,000 lb.	1,000 lb.	1,000 lb.	1,000 lb.
1910–11	362,063	362,019	193,046	555,065	387,748
1911–12	389,980	389,911	144,088	533,999	432,160
1912–13	420,050	419,968	217,272	637,240	421,322
1913–14	452,440	452,380	274,167	726,547	414,158

(ii) WHEATEN FLOUR AND MEAL—PRODUCTION, IMPORTATION, AND CONSUMPTION, 1910–11 TO 1923–24.

Year.	Total Milled Production.	Total Production (less Exports).	Imports (less Re-exports).	Retained or Available for Consumption.
	1,000 lb.	1,000 lb.	1,000 lb.	1,000 lb.
1910–11	298,268	282,846	138,843	421,689
1911–12	332,431	315,987	121,741	437,728
1912–13	324,094	308,603	137,453	446,056
1913–14	318,583	305,318	149,069	454,387
1914–15	370,974	363,309	99,408	462,717
1915–16	379,668	372,928	73,250	446,178
1916–17	428,576	418,140	61,233	479,373
1917–18	435,680	422,302	28,145	450,447
1918–19	461,874	449,044	25,838	474,882
1919–20	441,170	430,267	88,255	518,522
1920–21	397,986	389,431	135,125	524,556
1921–22	422,380	411,772	41,140	452,912
1922–23	442,062	432,874	82,642	515,516
1923–24	478,420	469,618	86,159	555,777

3. **Oats.**—The oat crop has a more important place in local agriculture than the wheat crop can generally command. This is attributable to the fact that oats will grow more satisfactorily than wheat upon poor soils; that the oat crop is not always grown for grain, but is sold in the form of hay, in which state it finds a ready market in most of the larger towns of the Union for cattle and horse feeding; and that, being grown for hay, it can be sown thickly, a larger return per acre being thus secured.

With minor exceptions the varieties cultivated belong to the *Red*, *Mediterranean* or *Algerian* type (*Avena Sterilis*). *Algerian* is the most popular variety. Besides being the best grain yielder, it provides an excellent quality oat-hay. *Texas*, *Sidonian* and *Smyrna* are good grain varieties, and *Burt* is an excellent early maturing variety for oat-hay. The weight per bushel of oats grown in the western districts of the Cape Province is about 40 lb. These varieties, however, do not yield the same meal as the heavier oats of other countries, which possess a much thinner skin, and not the same development of awn. Manuring for the oat crop is in general similar to that for wheat. Oats are more suited to medium loamy soils, while wheat requires a deeper soil with a texture of loam.

The thicker seeding of the oat crop (50 to 60 lb. per acre) enables a fine quality of oat-hay to be produced. Oat-hay grown under summer rain conditions is very stubbly compared with Cape winter oat-hay, and possesses a considerably lower feeding value. The farmer uses his oat crop for his equine and bovine stock as hay, or, as is done now by an increasing number, in the form of grazing. Oats make a better mixture with vetches than does wheat, either for grazing off with sheep, for silage, or for hay, factors which add to the popularity of the oat crop.

The yield of oats is from seventeen to twenty-four bushels per acre. Under ordinary conditions, when prices are not inflated, the oat crop is as valuable as, if not slightly more valuable than, the wheat, and the value of an acre of each is about £2. 10s. or £3. The average cost of production varies very considerably in different areas, so that the profit per acre cannot be readily stated.

The following tables show (i) the area seeded to oats in the different Provinces in 1923, and (ii) the production of oats from 1904:—

* Excluding oats produced in Native Locations, etc., which amounted to 9,588,600 lb. in 1918, and 2,152,650 lb in 1921.

Details of the exports of oats will be found in Chapter XVIII.

4. **Rye.**—Rye is the least important crop of the winter cereals. The area annually sown is slightly under 100,000 morgen, and of this area fully 30 per cent. is fed off by stock. It is used as a grazing crop more commonly in the north-west Cape and eastern Free State than in the south-west Cape. Oats provide a better hay crop than rye, and barley a better green fodder. The straw does not make a satisfactory roughage for stock on account of its toughness and because of the large proportion of fibrous material which it contains as compared with oat straw. Mixed with vetches or peas, it provides a good ensilage crop on the poorer soils.

The grain of rye is used to a limited extent for making rye bread and meal and as a stock feed. As a stock feed rye grain is not so suitable as oats and barley. In the south-west Cape crops of rye and oats mixed are grown on the poorer soils for feeding mules. For grain rye is grown chiefly on the poorer soils of the south-west Cape and on the more sandy regions in the north-western corner of the winter rainfall area. The better soils of these areas are devoted to wheat and the poorer ones to rye. The yield obtained from rye is lower than that from the other cereals and seldom exceeds 12 bushels per acre.

The following tables show (i) the area sown to rye in the different Provinces in 1923, and (ii) the production of rye in the Provinces from 1904 :—

5. **Barley.**—The barley grown in the Union is used for grain, for grazing, and for soiling. Each year approximately 60,000 morgen are seeded to this crop, and of the production 18 per cent. is grazed off and a further 12 per cent. is cut green and fed to stock as a soiling crop. Nearly 20,000 tons are used in this manner in the late winter and early spring. The varieties most suitable for this purpose are *Early Cape Six-row Barley* and *Hulless Barley* or *Barley Wheat*. Feeding barley is grown chiefly in the Cape Province, more particularly in the south-west Cape and in the south and south-eastern coastal areas. In the latter area it is a surer crop than wheat, which is very subject to rust. In the south-west Cape it may occupy the place of oats in the rotation.

The grain produced is used chiefly for feeding to live stock and for malting. As far as can be determined, 20 per cent. of the production is converted into malt. Barley of the grade required for malting is grown under irrigation chiefly in the districts of Worcester, Montagu, Robertson, Alexandria, and Lydenburg. Under irrigation in these districts barley gives a better return than wheat and is not susceptible to rust. Consistent efforts have been made to introduce various types of European two-row barley, which have a greater diastase-content than the six-row types. Under local conditions, however, these types are poor yielders, and most of the local malt is produced from bright-coloured plump *Cape Six-row Barley*, having a bushel weight of 50–52 lb. The malt compares favourably with malt made from Californian or Chilian barley, but it does not entirely dispose of the necessity for the importation of malt made from European two-row barleys.

Barley is sown in April–May at the rate of 50 lb. per acre and gives an average return of from 25 to 30 bushels to the acre. The variety generally grown is the *Cape Six-Row*. *Smyrna* and a drought-resistant variety known as *Mariout* are also commonly found.

The following tables show (i) the area of land seeded to barley in the different Provinces in 1923, and (ii) the production year by year in the Provinces:—

* Excluding production of barley in Native Locations, etc., which amounted to 1,394,700 lb. in 1918 and 1,850,400 lb. in 1921.

6. **Maize.**†—Maize production in South Africa is now one of the industrial mainstays of the country, and considerable quantities of maize are exported oversea annually. The industry is firmly established, and the high quality of maize produced in the Union is well-known to maize-importing countries. Prior to the Anglo-Boer war, insufficient maize was produced to meet local requirements, but maize-growing rapidly assumed great

† See section B below.

importance, and now occupies the same position in farming in the Union as wheat does in Australian and Canadian agriculture. That the industry has made rapid strides is shown by the fact that the total production has increased from 361,169 tons in 1904 to 1,900,000 tons in 1923. In less than a score of years, therefore, the production has increased by over 500 per cent. The value of the 1923 record crop, calculated at 10s. per bag, amounted to £9,500,000. This is equivalent to about one-ninth of the value of the total agricultural production of the Union. *

For a considerable time the *flint* breeds of maize alone were known. In the last two decades, however, which have seen a wider recognition of the country's suitability for maize cultivation and the introduction and acclimatization of many excellent *dent* varieties, maize has come to be the chief grain crop of the country. The nature of the crop and the methods of cultivation have undergone considerable change, as the knowledge of the limitations and possibilities of maize-growing has become clearly defined. Flint varieties, although generally not as high-yielding as the later-maturing dents, are found to be the most suitable sorts under adverse climatic conditions such as obtain in the drier western parts of the Union and also in areas with high altitudes where the growing season is not sufficiently long to mature the late dent varieties. The dents are found most useful in areas with a fairly long season, enjoying normal soil and climatic conditions; hence, where such conditions prevail, the dents are to be given preference to the flints. There is still much scope for maize growers in the Union. The greater yields that will result from more intensive culture, the increasing demands of consumers, stock feeders, and manufacturers, and improving methods of transportation, promise good returns to maize growers. The area within which maize can be grown successfully has come to be more or less defined. That a definite maize belt exists in the Union has not always been realized. Farmers outside the zone persist in growing this crop, notwithstanding repeated failures. Maize, not being a resistant of drought, is not a dry-land crop, but is more in the nature of a semi-tropical plant, indigenous to countries which enjoy considerable summer heat accompanied by fairly plentiful rains falling in heavy showers at short regular intervals, and it is this characteristic which limits the regions in which maize can be cultivated to the best advantage. In this respect maize is unlike kaffir corn, to which continuity of growth is not essential owing to its power of remaining dormant during intervals of dry weather, and of resuming growth when the rains recur. Thus is explained the inability of the coastal districts of the Union, and of the drier regions, such as portions of the Karroo, to produce maize with success.

Suitability of climate and of soil, and considerations of labour and of markets, are the factors which in a sense govern the production of maize. The principal maize-growing area in the Transvaal extends from Ermelo in the east to Lichtenburg in the west, southwards to the Vaal River, and north of a line drawn between Middelburg and Rustenburg. Outside this region small maize areas have been developed, in the Waterberg and the Zoutpansberg. The Orange Free State, in which Province is grown the heaviest crop per square mile, is, with the exception of the south-western portion, particularly suitable to maize production. The most fruitful maize fields of Natal are situated in the midlands, at an elevation of from 2,000 to 3,000 feet. Yields of fifteen bags per acre are often obtained in this area. Much of the Cape Province is unsuited to the growing of maize. In the Transkei and adjoining districts, however, the conditions are favourable, and considerable development has taken place. The central portion of the *high veld*, comprising the Districts of Heidelberg, Bethal, Standerton, Frankfort, and Heilbron, is at present the most productive area in the Union. The acreage under maize here is very extensive, and good crops are grown, producing from ten to fifteen bags per acre. The maize zone in South Africa may be said to possess two distinct and valuable advantages over the famous corn belt of the United States. The growing season is longer by from four to seven weeks, and this makes the season for planting a considerably longer one. Again, the drier atmospheric conditions in the Union produce a grain with a lower moisture-content; and this grain thereby less liable to injury during transit is more suitable for export, as well as for manufacturing purposes. The rainfall is generally sufficient if the soil is well cultivated, and the soil itself is of good quality throughout and quite excellent in parts. Labour is fairly plentiful and cheap; an expanding home market fairly well served by the railway is close at hand; and an assured and readily accessible market oversea, with cheap rates of transportation to Union ports and by ship, is being organized under the special direction of the Government. A well-appointed system of grain inspection and testing at shipping points has been established, and every endeavour is made to maintain a regular and cheap oversea service for the export trade of the country.

The marketing of maize in the Union, from the farmer's point of view, is rapidly becoming revolutionized. The old system of disposing of the crop for cash to the local storekeeper is giving place to marketing through co-operative societies and similar organizations. The elevator system will further improve the system of marketing to the advantage of the producer. In the past the farmer in many cases had to dispose of his crop as soon as he had reaped it, and usually at a time when prices are lowest. With the elevators this difficulty

* The yield in 1925 proved a further record. The final results of the agricultural census indicate the production at 2,429,558 tons and the value at 10s. per bag as £12,147,790.

will be largely removed by the issue of negotiable certificates for maize delivered to the elevator. These certificates will provide good security whereby the farmer will, if necessary obtain advances from the local bank.

In the wide field of agricultural interests in the Union the Government is giving special attention to maize among the various crops. At the Experiment Stations situated within the maize belt, extensive experiments are carried out which have for their object the determination of the best varieties to grow, the best systems of rotation to be practised, and the fertilizers most suitable to local soil needs. Large quantities of pure selected seed are issued to farmers at a moderate price. A staff of trained experimentalists and instructors, resident and itinerant, is maintained to give advice by correspondence and by lecture, and a maize-growing competition for boys has been established in order to encourage a wider and better knowledge of the value of this crop among those whose ranks will provide the farmers of the future. The Maize Growers', Breeders', and Judges' Association is an influential body aiming at the encouragement and development of this branch of agriculture, so that every endeavour may be made to place the Union in the forefront of the maize-producing countries of the world.

The following tables give particulars regarding the production, importation, and consumption of (i) maize, and (ii) maize meal during the years 1910–11 to 1924–25. All available information has been utilized in the preparation of the tables, proportionate figures being interpolated in cases where information is incomplete or not available.

7. **The Sorghums.**—*Kaffir corns* is the term most generally applied in the Union to these crops, but *sorghums* is more correct, including as it does the *grain sorghums* (kaffir corns), the *forage* or *sweet sorghums*, and *broomcorn*.

(i) *Kaffir Corns.*—The term *kaffir corn* as applied in the Union includes the true *kaffir corns*, the *milos, durras, kaoliang, feterita, hegari*, and several others. The kaffir corns are indigenous to Africa, and comprise the red and white varieties, as well as the varieties obtained by selection from these in other countries. Other grain sorghums have been introduced from Northern Africa, Asia, and North America. The heads of these varieties are typical, varying from the cylindrical long compact heads in the kaffir corns to the ovate, compact, often recurved heads of the milos and durras. The grains also vary in type from the small oval shape to the large flattened type, and, except for the red kaffir corns, are mostly white or light coloured. All the grain sorghums are of medium height, with more or less dry pithy stalks and relatively few leaves.

The red and white kaffir corns have long been used by the natives in South Africa as a food and also in the preparation of an alcoholic drink. In a prepared form, and as a cattle and poultry feed, their use is being extended both in South Africa and in Europe. As potential forage and grain crops for areas where maize cannot be profitably grown, they should be more widely cultivated than they are at present. In the United States of America, kaffir corns, which were introduced about 45 years ago from the Orange Free State, have become the standard grain crops in areas too dry for maize production. They are also grown to some extent as crops for fodder and ensilage. Although recourse to America for improved varieties has been considered necessary from time to time, improvement of the varieties by hybridization and selection is being undertaken by farmers in various centres and by Government institutions. The largest number of types is found in Zululand, though most of these are small grained and late maturing. Selection in the kaffir corns is being undertaken for earlier maturity, greater uniformity, and desirable types of heads and grain. Excepting for some scattered areas of milo, the production of improved imported types is still in the experimental stage. Yields of kaffir corn are equal to or somewhat inferior to maize, but in adapted areas they will outyield maize. Birds are liable to damage the crop somewhat, especially if plenty of cover is available and the acreage is small. Sorghums are also liable to be severely infested with stalkborer.

(ii) *Forage or Sweet Sorghums.*—To this class belong those types with medium to tall plants, juicy, and in many cases sweet stalks, and loose, open heads bearing small coloured seeds. These types usually sucker to a greater extent than the grain sorghums and are more leafy. Owing to the small yield and bitterness of the grain, the sweet sorghums are of little value for grain production, but for silage and forage purposes they are equal or superior to maize. Due to the stooling ability the yields are high, while the silage and fodder are of excellent quality on account of the sugar-content and palatability of the stalks. As with the kaffir corns, the greatest improvement of the sweet sorghums has been effected in the United States of America, where the majority of varieties has been derived from an importation from Natal about 75 years ago.

The sweet sorghums, like the grain sorghums, are extremely well adapted to semi-arid conditions, being drought resistant and able to resume growth and yield well after long, hot, dry spells. The natives, especially in Natal and Zululand, grow many types, mainly for human consumption. On a farming scale the most popular varieties are: *Amber Cane, Planter's Friend, Saccaline*, and *Sorghum saccharatum*. The last-named variety, though tall growing, has many of the characteristics of a grain sorghum and should perhaps be classified as such.

(iii) *Broomcorn.*—This is a type of sorghums with pithy stalks and long, loose-branched heads. Broomcorn, of which there are two main types, the standard or tall and the dwarf, is also drought resistant. It is grown for the heads which are harvested while green and sold after curing for broom and brush making purposes, while the plant after the brush has been removed may be used for silage or fodder, although the stalks do not have the juicy and sweet character of the sweet sorghum stalks. This is a very suitable crop for the drier summer rainfall areas, and the Union should be in the position to export brush to other countries.

(iv) *Poisoning.*—The impression that all sorghums are dangerous when fed to cattle seems to be very widespread. It should be pointed out that the pasturing of the second growth of sorghums and sorghums stunted by drought, or frosted, is dangerous and may result in fatalities amongst live stock. However, when cut and dried, even though stunted or frosted, or when made into silage, the danger from poisoning becomes negligible. Feeding of vigorous growing sorghums and sorghum silage is safe from the point of view of poisoning.

The table hereunder gives the production of kaffir corn in the Union :—

* Excluding kaffir corn produced in Native Locations, etc., which amounted to 267,665,800 lb. in 1918, and 216,325,400 lb. in 1921.

B.—SURVEY OF ECONOMICS OF MAIZE PRODUCTION.

8. **Importance of Maize Production in the Union.**—The production of maize is of the first importance in the Union, primarily because it is the staple food of the larger part of the population, secondarily because of the economic value of the product as a stock feed and for export to the markets of the world. Allowing for a consumption of four-fifths of a pound per day per unit of the native population, which is not an excessive estimate for times of plenty, a supply of 700,000 tons annually as a food for the native population is required. This excludes the requirements of 700,000 persons of mixed race and Asiatics, and 1,500,000 white persons, as well as the large requirements for the purposes of a food for cattle. Maize has never displaced wheat in the dietary of the white population of South Africa, except in cases of sheer necessity. By itself it is not suitable for making bread, and its combination with wheat and flour during part of the war period was most unpopular. As a supplementary article of diet for the white population, however, maize has a place, and, owing to its cheapness, frequently enters largely into the dietary of European families. In a general way it is estimated that the normal consumption of the Union amounts to about 9,000,000 bags, or 900,000 tons. That which is surplus may be used to an increased extent for feeding animals, for manufacture, and for foreign trade. As in the United States, so in the Union, the primary demand originally was for human consumption; but the importance of the product as a foodstuff for animals has increased constantly. In the United States, the latter object absorbs the greater bulk of the crops, and it is possible that in the future a similar development may take place in South Africa. As regards the manufacture of maize products, a beginning has been made in the Union, but the country still imports annually about 1,000,000 lb. of corn flour and Maizena.

9. **Production and Export of Maize.**—A series of tables giving particulars of the production, marketing, export, and price of maize will be found below. Some maize is grown in every district of the Union, but the important area of production lies roughly east of a line drawn between East London and Mafeking. In this area the native territories, though of great importance, do not produce maize on the scale of the northern Orange Free State and the southern Transvaal. Besides this, they export little, any surplus they have being put into their pits against a bad harvest. Even Basutoland exports only 50,000 tons a year. A fairly clearly defined area emerges as the chief producing region. This contains the districts of Bethlehem, Ficksburg, Frankfort, Harrismith, Heilbron, Hoopstad, Kroonstad, Ladybrand, Lindley, Senekal, Thaba 'Nchu, Vrede, Vredefort, and Winburg in the Orange Free State, and Benoni, Bethal, Bloemhof, Boksburg, Germiston, Heidelberg, Johannesburg, Krugersdorp, Lichtenburg, Middelburg, Potchefstroom, Pretoria, Standerton, and Wolmaransstad in the Transvaal, and a portion of Bloemfontein and Rustenburg to round the area off. The area of most intensive production is a triangle having Ladybrand, Lichtenburg, and Bethal as the vertices and its centre at Heilbron. This "maize triangle," as will be seen on the map illustrating this paragraph, contains thirty out of the thirty-two country grain elevators assigned to the maize district. The remaining two, at Middelburg and Pienaars River, are in the larger defined area.

Further details of the maize production of the Union, as well as of the export trade in maize, the system of marketing, the course of wholesale prices of that cereal and its derivative and allied products, and the cost of production, were given in the fuller survey included in the fifth issue of this Year Book.

10. **Grain Elevators.**—A great change in the system of marketing of maize has followed the institution of a national service of grain elevators. The question of the construction of grain elevators, debated since 1911, has at last become an actuality. In January, 1918, the Government appointed a committee of nine members, under the chairmanship of Mr.

G. C. S. Clarke, C.M.G., V.D., of the Railways and Harbours Administration, to investigate the question of the desirability and practicability of the establishment of the system in the Union. The Committee, after a comprehensive inquiry, presented its report in July, 1918, and unreservedly recommended the adoption of the system as a State enterprise under the immediate control of the Railways and Harbours Administration. In a report introducing the findings of the Committee, the General Manager of Railways and Harbours endorsed the views of the latter. The Committee formulated detailed proposals for the construction of a number of elevators at selected ports and inland centres and laid down the lines on which the system should be operated.

The Government, after consideration, accepted the principle of bulk handling, and decided to erect elevators at points to be determined later. Steps were also taken to secure the services of a consulting engineer to advise generally with regard to the matter. The recommendations of this gentleman (Mr. Littlejohn Philip), which substantiated those of the Committee, were contained in a report issued in May, 1920, and were accepted by the Government, although the programme of construction contemplated therein was subsequently modified owing to financial exigencies.

The construction of the terminal elevators at Durban and Cape Town was begun early in 1921. The Cape Town port elevator and thirty-four country elevators were completed in 1924 in time for the handling of a portion of the maize crop for that year. However, the opening season was unfortunately a bad one, owing to drought conditions; consequently the system only handled the comparatively small quantity of 80,000 tons, 45,900 tons of which were exported through the Cape Town elevator and the balance disposed of for local consumption. Owing to the difficulties with the foundations, it was not expected that the Durban port elevator would be completed until towards the end of 1925, or in the early months of 1926; meanwhile arrangements were made for handling maize in bulk by means of temporary appliances at Maydon Wharf. The following is a list showing the location and capacity of the elevators:—

GRAIN ELEVATOR SYSTEM.

Station.	Storage Capacity.	Station.	Storage Capacity.	Station.	Storage Capacity.
Port Terminal Elevators.	Tons.		Tons.		Tons.
Durban	42,000	Kinross	4,000	Moorreesburg	2,600
Cape Town	30,000	Senekal	4,000	Potchefstroom	2,600
		Rendezvous	4,000	Leslie	2,600
Country Elevators.		Lindley Road	4,000	Pienaars River	2,200
		Balfour	3,000	Ventersburg Road	1,800
Frankfort	5,800	Clocolan	3,000	Kaallaagte	1,800
Heilbron	5,800	Ventersdorp	3,000	Koster	1,800
Klerksdorp	5,800	Vermaas	3,000	Leeuwdoorns	1,800
Reitz	5,800	Vrede	3,000	Maquassi	1,800
Bethal	4,800	Coligny	2,600	Val	1,800
Bethlehem	4,800	Ficksburg	2,600	Westminster	1,800
Kroonstad	4,800	Middelburg (T.)	2,600	Davel	1,800
Bothaville	4,000	Makokskraal	2,600	Standerton	1,800

This system will afford an aggregate storage accommodation of 72,000 tons at the port elevators and 109,200 tons at the country elevators, or a grand total storage capacity of 181,200 tons. It is estimated that the total cost of these elevators will be over £2,500,000.

The elevator system may be briefly described as follows:—

Country elevators are established at the principal dispatching stations in the grain belts, and large *terminal* elevators at the ports. The farmer will bring his grain to the country elevator either loose in a box cart or in bags (whichever method he prefers). From his wagon the grain is tipped loose into the receiving hopper of the elevator, whence it is mechanically transferred to the elevator storage bins, being cleaned, weighed, and graded before deposit in the latter. Separate bins are provided for each different grade; but grain of the same grade belonging to different owners is merged in the same bin, its individual identity thus being lost. From the storage bins the grain is spouted loose into special railway box-trucks and conveyed either to another inland elevator or to the port, where it is mechanically transferred from railway trucks to the port elevator storage bins. From these bins the grain is spouted into the ship's hold and conveyed loose in the ship to the European port. All the principal European ports are equipped with elevators for taking grain mechanically from the ship's hold into storage bins. It will be seen that under the elevator system the grain flows in a stream. Mechanical power raises it to any required height at a minimum cost. To drop the grain from the elevator bins into railway trucks or ships, the force of gravity suffices.

The elevators will be controlled and operated by the Railways and Harbours Administration. The functions of the elevator system will be confined to grading, weighing, cleaning, storing, and handling the grain. The elevator authorities will not buy or sell grain. When the farmer deposits his grain in the elevator, he receives in exchange a transferable elevator receipt on which is inscribed the weight, description, and grade of the

grain. The elevator authorities absolutely insure the grain against all losses of whatsoever description whilst in the elevator system, and undertake (without any reservation) to deliver, on presentation of the elevator receipt, the exact weight and grade inscribed thereon. A deduction of 1 per cent. to cover wastage and loss of weight is made at the time the grain is placed in the elevator system. The elevator receipts are recognized by the banks as first-class security, on which they advance loans. Buying and selling of grain under the elevator system is done entirely through the medium of the elevator receipts. An essential principle of the elevator system is that all maize of the same grade is pooled. This pooling system renders possible considerable economies in handling and transport. In the commercial sense, the elevator system is really a grain bank : the farmer puts his grain into the elevator and secures a receipt. This receipt may be presented at any elevator in the country, and will ensure immediate delivery of the weight and grade shown on the receipt, subject, of course, to payment of any charges due, including cost of rail transport.

Bulletin No. 60, published by the Railway Administration in August, 1923, gives a comprehensive description of the elevator system, as well as information in regard to the proposed tariffs and regulations, etc.

In the early stages of the elevator system the full advantages of the system will not be gained, as a considerable portion of the local consumption grain trade of South Africa will continue to be handled in bags, owing to the fact that the present farm operations, milling methods and transport are based on the bag system, and it will take time before farmers and millers adapt their methods to the bulk system. A start in this direction has already been made by certain farmers and millers, and it is only a question of time before the new methods are more widely adopted.

11. **Grading of Maize.**—Maize and maize meal are graded as follows :—

MAIZE.

Grade Mark to be shown on bags.	Class.	Description.
1	Flat White No. 1.....	To be sound, dry, plump, and well cleaned, with a maximum of 1 per cent. of yellow, discoloured, and defective grain.
2	Flat White No. 2.....	To be sound, dry, and reasonably clean, and contain not more than 8 per cent. defective or other coloured grain, or both. Berries may be of irregular size.
3	Flat White No. 3.....	To be sound, dry, and reasonably clean, and contain not more than 13 per cent. of defective or other coloured grain, or both. Berries may be of irregular size and shape.
4	Flat Yellow.....	To be sound, dry, and reasonably clean, and contain not more than 9 per cent. of defective or other coloured grain, or both. Berries may be of irregular size and shape.
5	Round White.....	To be sound, dry, and reasonably clean, and contain not more than 9 per cent. of defective or other coloured grain, or both. Berries may be of irregular size.
6	Round Yellow.....	To be sound, dry, and reasonably clean, and contain not more than 9 per cent. of defective or other coloured grain, or both. Berries may be of irregular size.
7	Mixed.....	To be sound, dry, and reasonably clean, and contain not more than 10 per cent. of defective grain.
8	No grade.....	To include all maize which cannot be classed in a higher grade, but to be in dry condition and fit for shipment.

MAIZE MEAL.

M. 1	White Maize Flour	To be milled from South African grown white maize Government standard maize, grades Nos. 1 and 2.
M. 2	Granulated White Maize Meal	To be milled from South African grown white maize, Government standard maize, grades Nos. 1, 2, and 5.
M. 3	Ordinary Straight Milled White Maize Meal	To be milled from South African grown white maize, Government standard maize, grades Nos. 1, 2, 3, and 5 (mesh 18 to 32).
M. 4	Ordinary Straight Milled Yellow Maize Meal	To be milled from South African grown yellow maize, Government standard maize, grades Nos. 4 and 6 (mesh 18 to 32).
M. 5	Mixed Maize Meal	To be milled from South African grown white maize and yellow maize, Government standard maize, grades Nos. 1 to 7 (mesh 18 to 32).

The proportions of the different grades exported for four years 1915–16 to 1918–19 were : No. 1, 0·60 per cent. ; No. 2, 36·84 per cent. ; No. 3, 5·14 per cent. ; No. 4, 11·03 per cent. ; No. 5, 1·33 per cent. ; No. 6, 34·86 per cent. ; No. 7, 2·76 per cent. and No. 8, 7·44 per cent. It will be seen that almost three-fourths of the exports consisted of Flat White No. 2 and Round Yellow.

12. **Maize Yield and Elevator Operations, 1925.**—The maize crop of the Union in 1925 constituted a record; the total production, arrived at from the final results of the agricultural census, was 24,295,580 bags, equivalent to approximately 2,429,558 short tons

The elevator system was therefore subjected to a severe test, and in so far as the general working was concerned proved a distinct success. Between the 1st July and the 28th November, 1925, 470,000 tons passed through the system, 357,442 tons for export and 7,552 for local delivery.* Of the tonnage exported, 244,620 passed through the Cape Town elevator and 112,822 through the temporary appliances at Durban.

* At the 2nd January, 1926, the quantity shipped had reached the total of 398,448 tons, and delivered locally 9,545 tons.

Owing to the late rains the general crop was about six weeks later than usual, and it was well into the middle of August before the grain was sufficiently dry for acceptance into the elevators. The handling of over 4½ million bags was accomplished in about three months, making an average of 1½ million bags per month handled, which must be regarded as a remarkable achievement.

The elevator system has proved to be a great boon to maize producers owing to the enormous saving in the cost of grain bags, which were very expensive during the 1925 season. The average cost of a new grain bag to the farmer amounted to 1s. 6d., so that the bulk handling of 4½ million bags of grain through the elevators represented a saving of £337,500. A large proportion of this amount constituted a direct saving to the maize producers.

The farmer who did not use the elevator system suffered a disadvantage, for the reason that in selling his grain in bags he only received about one-third of the cost of the empty bag, as the average market price of maize in bags varied only from 3d. to 6d. per bag more than maize in bulk (200 lb. net) *ex* elevators.

The elevator system also proved of inestimable value to farmers and traders in disposing of their grain by means of the negotiable elevator receipt, which carries a guarantee of official weight and grade and thus eliminates disputes between buyers and sellers.

The experience gained during this season clearly indicated the need for extending the elevator system to meet the expanding maize industry of the country, and consideration is being given to the question of constructing additional country elevators. In the meantime provision has been made for the erection of one small elevator of a new design, and this will act as a guide in any further construction programme which may be decided upon.

The experiment of employing white youths in preference to natives for the unskilled work in the elevators has proved an unqualified success. This work affords a new avenue of employment for the youths of the country districts where elevators are located.

The machinery of the country elevators and the Cape Town port elevator has worked well, and no serious breakdowns have occurred since the inauguration of the system.

The following tables (i) to (vi) give information concerning the production, export, sales, and prices of maize and maize products over a series of years:—

2. **Lucerne** (*Medicago sativa*) **and Other Forage Crops.**—Lucerne is the best of forage crops. It is a hardy perennial of rapid luxuriant growth under favourable conditions, highly nutritious for live stock, and beneficial to the soil, which it enriches in its nitrogen-content.

Adaptations.—Lucerne is grown practically throughout the Union, but as a crop of any importance it is found mostly in the arid and semi-arid areas where irrigation is practised. Responding as it does to large applications of water and deep soils, plentifully supplied with lime, it is but natural that this crop should be the one of greatest importance on our rich alluvial soils. On practically every farm in the semi-arid region known as the Karroo is to found a field of lucerne, the size of which will depend upon the irrigable land available. There are one or two districts, however, where the growing of lucerne has assumed considerable importance. Oudtshoorn is without doubt the premier area from the point of view of production of hay, but more especially as a producer of lucerne seed. The District of Graaff-Reinet is also recognized as one of the most important lucerne-growing regions.

Varieties.—Adaptation is, however, closely related to variety, for one sort will thrive where others will fail. Generally speaking, all varieties thrive in the semi-arid regions when they are grown under irrigation. The variety known as *Arabian*, a hairy sort having an upright growth, is an exception, as it is very short-lived under all conditions ; furthermore, it produces a hay of inferior quality. The variety known as *Provence* is grown more extensively than any other, and is undoubtedly one of the most useful sorts in the lucerne area proper. While the *Hunter's River* (or *Tamworth*) variety is useful under semi-arid conditions, it would appear to be capable of thriving to much better advantage under humid conditions with sour soils than *Provence*. A new variety, to which the name *Chinese Lucerne* has been given, was obtained by the Department of Agriculture from the United States whither it had been brought from the borders of Thibet by Dr. David Fairchild, of the United States of America Department of Agriculture, and gives much promise of proving to be the best all-round variety of lucerne. At the Grootfontein School of Agriculture it has in experiments proved a wonderful grower. Moreover, it seems extremely frost-hardy, beginning to show growth fully a month earlier than other varieties and continuing its growth fully a month longer. It thus gives one or two cuttings more per season than other varieties. In addition, it may be stated that it has also been successful in humid areas. Farmers who have obtained seed from the institution seem generally to be satisfied.

Lucerne, however, makes a large demand on the soil for lime and phosphates, and in a number of South African soils these constituents are deficient. More particularly it is indispensable that the supply of lime should be abundant, and it is fortunate that the extensive lime deposits in the Union enable it to be obtained cheaply. The type of soil

best suited to lucerne is a deep loam. There is a large extent of this soil capable of being irrigated in the Union, especially along the numerous small rivers throughout the country. The development of irrigation in the Union, together with the expansion of the live stock industry in recent years, has very rapidly advanced the cultivation of lucerne. Hitherto a great deal of lucerne hay has been baled on farms and dispatched to market for sale, but the practice of consuming the crop on the farm and marketing the meat or dairy product is becoming more general. The principal impetus to lucerne growing was due to the rise of the ostrich feather industry; more recently the advance of the pig industry has had a similar effect. These industries have been built upon the depasturing of lucerne. Lucerne as hay is likely to become the most important supplement to veld grazing in the development of the beef export trade, and in the milk, butter and cheese industry it is being used to an increasing extent and with great success. The yield of hay in the Union ranges from 4 to 8 tons per acre per season. The Union is equally well suited to the production of lucerne seed; the climatic conditions necessary for this are ideal—a hot and for the most part dry and calm ripening season.

In the form of meal, lucerne is especially a valuable addition to the mash fed to poultry, in which it can be used to replace some of the more expensive constituents. A fair demand for lucerne in this form has arisen in European countries and another market thus created for this product of South African agriculture. Lucerne mills are being erected in various parts of the country.

Area of Land under Lucerne.—The following tables illustrate (i) the actual and (ii) some potential lucerne growing areas in the Union:—

(i) **AREA UNDER LUCERNE, 1920-21, BY PROVINCES.**

Province.	Area in Acres.	Yield in Pounds.
Cape	122,937	140,524,000
Natal	2,064	7,698,000
Transvaal	7,947	21,964,000
Orange Free State	9,164	16,320,000
TOTALS	142,112	186,506,000

Total Acreage in 1917–18 .. 119,585.

(ii) **AREA OF LAND UNDER VARIOUS MAJOR IRRIGATION SCHEMES, 1923.**

Project.	*Area Rated (Acres).*
Hartebeestpoort	40,000
Lake Mentz	38,000
Kamanassie	27,000
Van Ryneveld Pass	22,000
Grass Ridge	20,000
Tarka	35,000
Kaffir River	4,800
Bon Accord	1,395
TOTAL	188,195

It is estimated that of the nearly 200,000 acres that will soon be under irrigation projects, some 100,000 acres will be established to lucerne.

3. **Teff** (*Eragrostis Abyssinica*).—This is a grass that has been introduced from Abyssinia. It is a summer annual, very leafy plant, characterized by its resistance to drought, its earliness, and the excellence of the hay that is produced when the crop is cut at the right time. Under favourable conditions the grass will attain a height of four feet and will be ready for cutting in some six to eight weeks after sowing. Frequently a second cutting may be obtained in the season, while, where the season is long enough, a considerable amount of aftermath may be available for grazing following the removal of the second hay crop.

Teff is adapted to the lighter types of soils, particularly sandy loams. Very rich soils are not so well suited to the crop, as the plants tend to grow luxuriantly and lodge owing to the very fine stem. Areas of very high rainfall are not well adapted to teff and good hay cannot be made under such conditions. The most suitable areas for teff are the Transvaal high veld, the Eastern Province of the Cape, the North-Eastern Free State, and the Uplands of Natal.

Teff is a useful crop for rotation in the maize belt, but as both teff and maize are liable to be attacked by the *Rooi Blom* (Witch Weed), it is advisable that the two should not be grown continuously in succession. It is one of the most palatable of hays and is readily eaten by all classes of stock. Compared to other grasses, it is high in protein, having a nutritive ratio of about 1 : 6 or 7. The yield per acre under favourable conditions may be as high as three or four tons, although an average of about two tons should be expected. The cost of production varies from 8s. to 12s. per ton or £1 per ton when baled, and the value on the market is from £2. 10s. to as high as £5 per ton.

To be successful with teff it is necessary that the seed bed be carefully prepared as the seed is extremely fine. Seed should be broadcasted at the rate of five to seven pounds per acre and then very lightly harrowed in. The sowing may take place from the beginning of October to the end of January. In making hay care should be taken to cut the crop before the seed is formed; in other words, just about the time when the plants come into flower. The quality of the hay becomes inferior as the crops pass towards maturity.

4. **Agricultural Grasses.**—Various attempts have been made to improve the grazing in this country by the introduction of so-called artificial grasses. Some of these grasses have proved a success, but there are very few areas where grasses are cultivated to any extent. Most of our indigenous grasses are characterized by summer growth only, except in those areas where the winters are mild and where a fair amount of rain falls in the winter. Under irrigation grasses must be in a position to compete with lucerne, but as there are few grasses that can give the same quantity of nutritious hay under irrigation as lucerne, very little grass cultivation is practised on irrigated lands, and those that are cultivated are usually the winter-growing varieties that will provide grazing during the time when lucerne is making little growth. As a general rule, it may be taken that cultivated grasses require fairly good soil and a fair amount of moisture.

As a result of experience with numbers of grasses, it may be said that in the warmer areas, with mild winters, the best grasses are *Kikuyu*, *Natal Grass*, *Napier Fodder*, and *Rhodes Grass*. These are all palatable grasses that will remain permanently green in areas where little or no frost is experienced and where the rain is fairly well distributed throughout the year. Under irrigation the grasses that will be found most useful are the winter-growing sorts, of which the best are *New Zealand Tall Fescue*, *Phalaris Bulbosa*, *Tall Oat*, *Cocksfoot*, and the *Rye* grasses. These varieties should also be useful in the winter-rainfall areas. A grass that spreads rapidly in areas of fairly high rainfall and thrives in moist low-lying spots is *Paspalum*. This grass is to be found growing extensively in the more moist parts of the Union, but the objection to *Paspalum* is the tendency for the seed heads to become ergotized. Ergot, of course, is dangerous to stock.

At the Government Experiment Station at Bathurst, the summer grasses enumerated above give every promise of being the means of improving very considerably the grazing in that area.

5. **Spineless Cactus.**—*American Aloe and Salt Bush.*—The best means of reducing stock losses during periods of drought is by conserving fodder during the times of plenty for use during the lean years. In some areas so little water is available for growing cultivated crops that the drought problem is a most difficult one. Fortunately there are certain drought-hardy plants that will thrive even during the most protracted droughts. Such drought-hardy plants are the cactus group, the American aloe, and the varieties of salt bush. Not only do these plants withstand drought, but they will thrive on most soils, while the salt bush flourishes on land too brak for ordinary crops. In addition these plants remain green and succulent in the winter and in long protracted droughts, with the result that they can be made to furnish a very essential part of the animal's diet, namely, green succulent feed so essential for animals in milk. These drought-hardy plants are also very palatable and easily established.

The leaves of the spineless cactus and suckers from the aloe are planted out in rows in the early spring, and provided the land is fenced in to keep away stock, no further attention will be required. In three or four years the spineless cactus will yield annually a crop of leaves of some 30 to 60 tons per acre, while in six or seven years the aloe will provide about the same returns. The salt bush (Old Man variety) should be planted in seed-beds in August and later, and about March transplated into the permanent plantation, which can be protected from stock for three or four seasons. Such a plantation will furnish excellent grazing for all classes of stock. The creeping salt bush (*Atriplex semibaccata*) may be broadcasted at the rate of 5 to 10 lb. of seed per acre during the rainy season.

Farmers in the drought-stricken areas especially should make every effort to reduce losses of stock by establishing acreages of these plants. It may be stated that animals have been kept without water for over 500 days merely by feeding on cactus leaves. In themselves the cactus and aloe are not sufficient to maintain an animal which in addition requires a food of the richness of lucerne.

6. **Chicory.**—On account of competition from overseas, chicory growers have had many ups and downs. The chicory growers of the Union are now afforded some measure of protection by the duty on imported chicory. As the quality of the chicory grown in the Union is considered by manufacturers to be equal to that of the imported article, users of chicory in this country should insist on the home product in preference to that from overseas, thereby ensuring a ready sale for the South African product and helping the chicory growers of the Union.

Excellent chicory is produced in Alexandria, in the Cape Province, and Bethal, in the Transvaal, while the crop can be grown in George, the Gamtoos, Pretoria, Piet Retief, and many other districts and Swaziland. Those farmers who grow or intend growing the crop should make contracts with manufacturers before planting an extensive area. Names of manufacturers can be obtained by communicating with the Secretary for Agriculture. If contracts at the rate of 15s. per 100 lb. could be secured by growers, profits of £10 per acre and over should be obtained. Chicory is best adapted to deep well-drained soils that are not too sandy. It is cultivated as a summer crop in the Transvaal and as a winter or summer crop in Alexandria (where sowings are made in March or September). The variety usually planted is the *Long Magdenburg*. As weeds are troublesome, the crop should only be sown on clean lands, as this saves a considerable amount of labour later. About 1½ lb. of seed per acre, planted in rows 12 in. to 18 in. apart, will be required. The crop responds to applications of manure and fertilizer. The former, which should be well rotted, must be applied some time before sowing. Superphosphate and sulphate of potash at the rate of 200 and 50 lb. per acre respectively should have a beneficial effect.

The crop is harvested when the roots on being cut show no sign of giving off a milky fluid. This is usually about six months and four months after sowing in the case of the winter and summer crop respectively. Details with regard to the treatment of this crop may be found in Reprint No. 27, 1921, of the Union Department of Agriculture, Pretoria, which may be procured from the Librarian, Department of Agriculture.

7. **The Millets.**—The millets or manna are relatively quick-maturing summer annuals that thrive in hot areas. They are very drought hardy and can be grown successfully on rather unproductive soils. There are several types of millets, the chief being the *Foxtail*; others are the *Japanese Barnyard*, and the *Pearl* millets. These crops are used largely for the production of hay where a quick-maturing summer catch-crop is required. The hay is inferior in quality to teff and is not to be recommended for horses as a sole diet, as millet hay causes disorders known as millet fever. The *Pearl* millet is rather a coarse late maturing variety that is used for the production of grain (chiefly for poultry feed and for beer making by the natives) as well as for hay. From 15 to 20 lb. of seed are required per acre, the method of sowing usually being that of broadcasting. As the crop thrives in hot weather and is very tender to frost, planting should take place somewhat late in the season from November to January. Hay, which should be cut when the plant comes into flower, will be ready in some 8 to 12 weeks after sowing, depending on the variety. As the millets will yield two to three tons or more of fair-quality hay per acre, they are to be recommended as a catch-crop in those areas where rainfall is uncertain and often too late in the summer to permit of maize being grown.

8. **Silage.**—All animals are partial to green succulent feed; and succulent feed is especially required by animals in milk. In many parts of South Africa conditions are such that stock for a great part of the year cannot obtain the desired amount of green feed in nature, so that the farmer has to provide for it by some other means. This other means may be either the growing of fodder crops and feeding them off to stock green from the land, or the preservation of suitable crops in a succulent form by protecting them from the air. The produce obtained by this latter process is known as ensilage, or, more commonly, silage.

The advantage of silage-making is that practically all of the commonly grown agricultural plants, and even veld-grass, can be utilized for this purpose, so that the farmer can grow the crop most suitable to his area. It also enables the farmer to preserve feed in a succulent form for his stock for that part of the year when he cannot economically obtain green fodder from his fields and when the veld itself yields little, or no, green herbage.

Although the majority of commonly cultivated plants have given satisfactory results in experimental trials, practice has shown that maize is the silage-crop *par excellence*; and the value of the silage is increased if the maize is mixed with a leguminous crop in the proportion of two of the former to one of the latter. In the latter case it is to be recommended that the maize be drilled and the other crop sown among the young maize plants. Velvet beans or cow peas serve this purpose well. The two crops should, however, not be sown together if general conditions, e.g. rainfall and soil fertility, are not such that big yield may be expected.

Silage from maize should be made when the plant has already set seed and the latter has reached the dough stage, which will be about the fifth or sixth week after the tassels have formed. In the case of the finer legumes (such as lucerne) the crop should be cut when it is past the flowering stage; in the case of the coarser varieties, e.g. velvet beans, when they are in the pod stage. The plants should, however, not be cut when they are too young, as a heavy loss will result in the silage because of the excessive amount of moisture contained and subsequently liberated by the stalks and leaves. On the other hand, if they are cut when they have become old, desirable fermentation does not take place. Nevertheless, good silage may be obtained from what would appear to be useless dry plants if sufficient pressure be applied to exclude air and water be added, e.g. sprinkled over the plants, to soak them thoroughly and so establish conditions satisfactory for fermentation. As much heat is developed in this process, the silage should preferably not be used for at least eight to ten weeks after being put into the silo, because of the danger of admitting air and the consequent burning and spoiling of the silage.

As the plants used for silage must be preserved out of contact with air, they are packed or stored in a structure known as a *silo*. This may take either the form of an underground pit, when it is known as pit-silo, or in an above-ground construction, known as a tower silo. The former is usually a rectangular trench dug out in the soil; the latter is a cylindrical tower constructed of concrete, steel-plates, or even wood. The cylindrical silo is, of course, much more expensive to construct than the pit or trench silo.

A trench silo recommended by the Department of Agriculture (see Bulletin No. 14, 1924) is one having the following dimensions: The trench should be 60 feet long and 12 feet wide at the bottom, 15 feet wide at the top and 12 feet deep. There is an outslope at each end—one of 1 in 3, the other 1 in 5. The surface dimensions including the outslopes will be 156 feet by 15 feet. To excavate the trench, first mark out on the site selected the surface dimensions given, plough and remove the soil with dam scrapers, and trim the walls smooth with spades.

A silo constructed according to the above instructions will be of 315 tons capacity when full, and for every foot it is made longer or shorter, its capacity is increased or decreased two and four-fifth tons. The advantage of this form of silo is that it permits of a wagon being driven into the trench, and the stalks turned out directly into it. Thorough tramping is done by the wagons passing over the plants, and air is thus forced out. In the case of the overhead silo the plants are cut up fine and blown into the tower. Careful spreading and tramping should in all cases be done, especially around the edges, so as exclude as much air as possible.

Burtt-Davy calculates that, on the basis of 5 lb. of silage for a sheep, 20 lb. for an ox at work, and 30 lb. for a dairy cow per day, 170 tons of silage will feed and keep in condition 680 sheep, or 170 oxen, or 113 dairy cows for 100 days, or 500 sheep and 24 oxen and 4 dairy cows for 109 days.

The number of silos in the Union has been steadily increasing during the last few years. This indicates that farmers are beginning to appreciate the value of this form of succulent fodder, which is palatable and readily eaten by all classes of stock.

§ 5. General Agricultural Crops (Non-Cereals).

1. **Miscellaneous.**—The following tables give particulars as to the cultivation and production of general agricultural crops in the Union :—

GENERAL AGRICULTURAL CROPS (OTHER THAN CEREALS) REAPED DURING YEARS 1917–18 TO 1923–24.

(i) POTATOES, SWEET POTATOES, PEAS, AND BEANS IN THE UNION.

Year.	Potatoes.		Sweet Potatoes.		Peas.		Beans.	
	Area.	Yield.	Area.	Yield.	Area.	Yield.	Area.	Yield.
	Acres.	1,000 lb.	Acres.	1,000 lb.	Acres.	1,000 lb.	Acres.	1,000 lb.
Census, 1917–18*	110,185†	234,536	20,391†	69,141†	15,394†	11,170	64,500†	51,295
,, 1918–19.	—	205,713	—	—	—	—	—	—
,, 1919–20.	99,648	187,633	—	—	—	—	—	—

UNION	71,530	211,771	16,227	14,378

* Native Locations, Reserves, etc., not enumerated.
† Including 3,881,080 lb. produced in Native Locations, Reserves, etc.

2. **The Potato.**—The potato ranks as one of the leading crops of the Union. It is grown in most parts of the country, though production on a large scale is confined to more or less definite areas where the necessary climatic, soil, and marketing conditions obtain. In the Transvaal, the area of greatest production is found on the high veld, centring around Bethal, Middelburg, and Heidelberg. In the low veld to the north and east, the crop also finds favour under irrigation. In the Orange Free State, it is chiefly grown in the area extending from Thaba 'Nchu and Ladybrand to Harrismith, while potatoes are largely grown under irrigation in the neighbourhood of Petrusburg. The popularity of the crop in Natal increases from the coast northward, the best potato area merging into that of the eastern Transvaal. The Cape Province area of maximum production extends from the

districts surrounding Cape Town to beyond Cathcart being concentrated in the Coastal Belt. The areas where the crop is grown without irrigation are characterized by comparative cool climates, rather light soils, and average annual rainfalls ranging from about 25 in. to about 30 in., the major portion of which falls during the summer.

The time of planting varies in the different areas of the Union. In the eastern Free State, the main crop is planted from November to January, while on the high veld of the Transvaal planting occurs somewhat earlier—from September to December. In the low-veld districts of the Transvaal, owing to the small amount of frost experienced, it is possible to plant the crop in June and July and so catch the early market in October. The crop is one which demands a high standard of cultivation, and the liberal use of fertilizers and animal manure is almost universally necessary. The operations of planting and lifting are usually done by hand.

Hitherto the best growers have imported most of their seed from Scotland and the Continent, but the possibility of producing locally grown seed as good as the imported article is now being realized. In 1924, a Seed Potato Growers' Association was formed with this object in view at Westminster in the Thaba 'Nchu District of the Free State. The Association receives the warmest possible support from the Department of Agriculture, Government experts being supplied to select and grade both the growing crops and later the harvested tubers. The potatoes which attain the desired standard of excellence are sold as "certified seed" under the trade mark of the Association, a certificate of guarantee being also furnished. Sources of supply of this nature in the country are badly needed, as they will enable the farmer not only to obtain his seed at a lower price than that of the imported article, but also without the delay and trouble that often accompany importation. It is hoped that the example of this pioneer Association will soon be followed by others.

The potato market is an uncertain and fluctuating one. So many factors influence the crop that it is impossible to predict returns accurately at any length of time before harvesting. Supply is, therefore, inclined to be erratic and market prices vary accordingly. In the Union, potatoes are sold in bags at 153 lb. gross weight, the principal markets being Durban, Johannesburg, Cape Town, East London, Port Elizabeth, Bloemfontein, and Kimberley. In recent years, an increasing demand has risen for properly graded tubers of the best quality.

3. **Beans.**—Beans grow well in most parts of the Union, but have not so far been grown in sufficient quantity for export. An investigation is being carried out by the Agricultural Department with a view to establishing a standard nomenclature and classification of beans. Experiments are also being carried out to ascertain the varieties suitable for growth in the various parts of the Union, especially for the purpose of export. At present, beans of the dwarf varieties are largely raised for local consumption; these consist of the *Sugar*, *Haricot*, and *Butter* types. *Speckled* beans are largely grown for native trade, the *Haricot* type being more in demand for European consumption. Samples of beans have been submitted to merchants in Great Britain, and, as a result, a system of grading has been suggested. The following varieties, being white in colour and of attractive appearance, are readily saleable in the European markets: White Canadian Wonder, White Flageolette, White Haricot, Case Knife, Canterbury White, and White Scimitar. These produce a good type of bean as regards colour, shape, yield, and edibility, and are early harvesters, maturing as dry seed in ninety days. For local native trade the *speckled* varieties are in demand. These include the well-known *sugar* varieties, i.e. Speckled Port Natal, Natal Sugar, Natal Red, Sugar Dwarf, and Best of All. These are dwarf varieties, mature early, and provide good yields. A white variety of bean known as the *Bomba* or *Natal Large White Kidney* is very suitable for export, but is a runner, and the beans ripen unevenly; this makes harvesting slow and expensive compared with the dwarf varieties.

The *Lappie* is an early runner variety which does well in parts of Cape Province. Of khaki- or brown-coloured beans, the following varieties yield well and are in demand: African Wonder, Bountiful, and Burpees Stringless. The *Tepary Bean* is suited to semi-arid districts, owing to its drought-resistant qualities. It is grown in the Transvaal, and yields good crops of greenish-white beans. *Lima* beans are grown in the sub-tropical districts, but not to the same extent as the dwarf varieties. They require a long growing period (150 days). The following varieties have produced satisfactory yields: Small Butter and White Governor. These are runners and ripen unevenly. Good dwarf varieties are: Wood's Lima, Henderson's Lima, and Burpees Lima.

Some beans are grown mainly for green manuring or soil renovation. These include the *velvet bean*, which provides a heavy growth of foliage and may be utilized either as green manure or as stock food. The *Hyacinth* (*Dolichos*) *bean* produces a very heavy vine, and can be used in a similar way to the velvet bean. Both these varieties pod very late, and require 180 days for seed maturity. If planted early in October they will produce seed in following April. *Field* beans require a good medium loam soil, but will grow in a lighter soil. The heaviest yield is obtained from crops planted in November or December; crops planted later—in January or February—do not show the same vigour in growth, but escape to some extent the depredations of the flower-eating beetle known as *Mylabris*. Planting

is carried out in drills 2 to 3 feet apart, with a spacing of 6 inches in the rows. The seed required per acre depends on the size of the seed used—the smaller seed, like *White Canadian Wonder*, requires 30 lb. per acre; the large seeds, like *Bomba*, require 60 to 80 lb. per acre.

Beans respond readily to phosphatic fertilizer. Frequent cultivation is essential. The crop should be harvested when the greater number of pods have ripened; it is not advisable to wait until all the pods are completely ripe, as there is a probability of loss owing to the premature shedding of over-ripe seed pods. The crop is threshed by means of the flail. The yield varies between three and eight bags per acre.

Soya beans are largely grown for their value as cattle-food in the form of ensilage or hay; they are also valuable for soil renovation, and are used for this purpose. The bean contains a high percentage of oil, and is largely in demand by soap manufacturers. Suitably balanced with other ingredients, the bean is a very useful cattle-food. Good varieties for ensilage are: American White, Mammoth, and Southern. For seed production the Brownie variety is most suitable. Soya beans respond to good soil conditions, and will give a fair crop on the lighter loams. They do not form nodules so readily as the cowpea, but these can be induced by inoculation with suitable cultures. Planting should be carried out in early November in drills 3 feet apart—beans 6 inches apart in rows. Harvesting for hay should be done when pods are green; for ensilage when pods are well formed and just changing colour. The crop can be cut by mowing machine. If required for seed, the plants are pulled when most of the pods are ripe; threshing is done with the flail.

Other beans useful as soil renovators are *Mung*, *Adsuki*, and *Tofy*. These are varieties obtained from Eastern Asia. They are sown and cultivated in much the same way as cowpeas. The *cowpea* is very useful for stock-feeding and soil improvement; it is much used as a legume in the rotation of crops. It readily forms nodules, and is prolific in growth. It is known in some parts of the Union as the *Kaffir Bean*. It makes excellent hay or ensilage, and when ploughed in, builds up the fertility of the soil. Crops can be taken off as hay or ensilage, the roots and stubble remaining being ploughed to assist soil renovation. Good varieties are *New Era*, *Iron*, and *Wonderful*; these produce heavy vines. The *Brabham* variety is very upright in growth, and can be cut with a mowing machine. Cowpeas grow well in a sandy loam and respond to richer types of soil. Planting should be carried out in November (for seed) and December (for hay and ensilage). Planting is carried out in drills 3 feet apart, using maize planter with suitable plates. Frequent cultivation is necessary until vine forms complete cover. About 30 lb. seed per acre is required. The crop is ready for harvesting as hay just after the formation of pods; for ensilage when the pods are well formed. If required for seed, the pods can be hand-picked and threshed with the flail, the remaining part of the plant being fed to stock.

Broad beans and *peas* may be grown as winter legumes, but the former do not provide very satisfactory returns. Comparatively good varieties are *Aquadulce* and *Sevelle Long Pod*. Planting is carried out in April, the crop being ready for harvesting as dry bean in November. Suitable winter pea varieties are *Australian Maple Peas* and *Daisy Peas*. *Vetches* are suitable winter legumes. There are two outstanding varieties: *Spring Vetches* and *Hairy Vetches*. These are sown in April, and can be harvested in November.

4. **Peanuts.**—The peanut, also known as the ground-nut or monkey-nut, is a sub-tropical to tropical legume, requiring a fairly long growing season of from $3\frac{1}{2}$ to 5 months and is very sensitive to frost. It is a crop of increasing importance in many low veld and middle veld areas, the leading districts in production being Pietersburg, Waterberg, Zoutpansberg, Barberton, and Pretoria, in the Transvaal. The natives have grown this crop for many years, but it is only since 1914 or thereabout that its value as a nutritious hay crop and concentrate has been recognized by farmers. It is proving a valuable crop for the drier, warmer areas of the Transvaal, fitting very well into farming systems in these areas. The nuts are used in the preparation of products for human consumption and also as a source of high quality oil. The cake resulting from the expressing of the oil forms a palatable high protein concentrate for cattle. The peanut plant, being fairly drought resistant, is adapted to the warm, dry summer-rainfall areas of the Union. Having a fairly high labour requirement, its culture has been most successful in areas where native labour has been plentiful. The growing importance of the crop, however, has created a demand for machinery for its culture. With the more general use of machinery, a greatly increased production can be expected.

Peanuts thrive well on fertile soils, the lighter sandy soils giving the best quality of product from the commercial point of view. This crop is fairly free from serious diseases or insect pests, although *Rosette* disease has been serious in certain areas. Now that the problem of the transmission of this disease has been solved, a solution of the problem of control may be expected.

The average yield of peanuts is from 17 to 20 bags per acre, while with good farming, 25 bags should be obtained. The crop is usually marketed in bags containing 70 lb. of unshelled nuts.

§ 6. Vineyards and Fruit Cultivation.

1. Viticulture.—(i) *Introduction of Viticulture into South Africa.*—It is generally believed that the French Huguenots were the first to introduce the vine into South Africa, and it is often stated that they came to the country with a Bible in one hand and a vine in the other. As a matter of fact, however, the vine was introduced into South Africa as early as 1653—the year after the landing of Van Riebeek. At that time the Netherlands East India Company traded largely with the East Indies via the Cape of Good Hope. One of the articles traded in was brandy, which was obtained from France, through the port of La Rochelle. This gave the French brandy industry an enormous impetus, and it was soon found that the brandies from the Charante district, of which Cognac is the chief town, were superior to brandies from other districts. Hence it is not surprising that the Dutch, knowing the value of brandy, should introduce vines at the Cape with the object of producing the article themselves. The Governor, Van der Stel, encouraged and helped viticulture as much as possible, importing vines from France, Germany, and Portugal. The French Huguenots, who came mostly from wine districts, adapted themselves naturally to the cultivation of the vine, and viticulture became one of the most important branches of agriculture in South Africa, especially in the Paarl and Stellenbosch districts, where the Huguenots mostly settled, and where viticulture still predominates over other agricultural pursuits. To-day vines are largely cultivated in the following districts, named in order of production :—Paarl, Worcester, Stellenbosch, Malmesbury, Cape, Robertson, Tulbagh and Ceres, Piquetberg, Montagu, and Caledon. In many other districts vines are grown, but on a smaller scale.

Early in the year 1886, the Phylloxera was discovered in the Cape and Stellenbosch districts. The Government of the Cape of Good Hope made every effort to eradicate the disease, but without success. In 1892 resistant American stocks were imported, and about 90 per cent. of the vines of the Union are now grafted on such stocks.

The table hereunder gives particulars as to the extent of vineyards and the number of vines of different varieties in the Union :—

VINEYARDS, 1918 AND 1921.

Description.	Cape of Good Hope.	Natal.	Transvaal.	Orange Free State.	Total, 1921.	Total—Census of 1918.
Area of Vineyards—Acres	54,405	25	347	271	55,048	47,167
Number of Vines—Bearing	84,258,133	22,400	410,430	279,297	84,970,260	74,829,242
Non-bearing	16,981,374	7,100	95,542	53,708	17,137,724	13,010,724
TOTAL	101,239,507	29,500	505,972	333,005	102,107,984	87,839,966

The natives have not as yet adopted this branch of farming.

(ii) *Government Aid for the Industry.*—About 1885 the Cape Government bought the farm *Groot Constantia* in the Cape Peninsula, with the intention of carrying out experiments in viticulture and wine-making, as well as of educating farmers in improved methods of wine-making. Several young farmers availed themselves of this opportunity by working on the farm for some time as apprentices. A competent man was appointed to manage the farm and to act as adviser to the farmers. One of the many resultant benefits was the raising of the standard of the country's light wines owing to the superior article produced and placed on the market.

In 1910 the Government bought the small farm *Belle Vue* in the Paarl district as an experiment station for testing the best grapes both for market and wine-making purposes. Dr. A. I. Perold, who was at that time appointed Viticulturist for the Union, was stationed there and he imported about 200 different varieties of grapes. This station is of considerable assistance to viticulturists, as from it many varieties of grapes are distributed over the Union after their suitability as table or wine grapes has been studied. Experiments in wine-making are also carried out at this station.

In 1905 the Cape Government inaugurated a scheme of co-operative wineries by furnishing financial assistance in the shape of loans. Under this scheme nine co-operative wineries were established where large quantities of wine of uniform quality could be made

for which a ready market could be found. At first these wineries failed to realize anticipations and two were closed down. The rest, however, are now doing very well, and it is acknowledged that it would be beneficial to the industry if more co-operative wineries were established.

(iii) *Co-operative Association.*—Towards the end of 1917 the wine market was very depressed, wines being sold for £2. 10s. and £3 per leaguer (127 gallons), which is not considered to be remunerative to the producer. Consequently, the farmers decided to unite, and thus the Co-operative Wine Farmers' Association of South Africa, Ltd., was formed. Over 95 per cent. of the wine farmers joined this Association, the object of which is to guarantee a minimum price for wine, and thus to ensure a stable wine market. A board of directors is appointed by the members, which fixes yearly the prices for wine. The farmers, on joining, undertake not to sell their wines to any merchant who is not a member of the Association, and on their part the merchants promise to buy wines only from farmers who are members. In case a member sells his wines below the minimum price or to a non-contracting merchant, he is liable to a fine of £5 per leaguer, unless he exports his wines. Difficulties, however, arose with regard to certain ambiguous clauses in the constitution, which led to the subsequent reorganization of the Association on a sound basis, so as to fall in line with Act No. 28 of 1922. The wine merchants thereupon resigned as members of the Association.

During the first session of Parliament in 1924, the *Wine and Spirits Control Act* (No. 5 of 1924) was passed, which gave the Association absolute control over all wines declared by the producer as distilling wine, whether belonging to a member or a non-member. Every wine grower in the Cape Province renders to the Association on a certain date each year a return of all wines, spirits, and brandy produced by him, and states what quantity he has for disposal for consumption as wine, and what quantity he has for sale as distilling wine. Further, the Act laid down that after the 1st June, 1928, only spirits and brandy, kept in wood for at least three years, may be sold for consumption. The price the farmer gets for distilling wine is each year fixed by the board of directors, according to the surplus. Henceforth, no wine can be included in the surplus which was not declared as distilling wine.

For every leaguer of wine sold by a member, the Association deducts ten shillings for three years, and for every amount so deducted the member receives a share in the association. The intention is that the fund created should be used by the Association when necessary to deal with any surplus wine which may be on the market, the Association buying these wines at the minimum price, and after they have been turned into spirits, disposing of them outside the Union.

(iv) *Branches of the Industry.*—Vines are grown in the Union to produce fresh fruit, to promote wine-making, and to produce brandy and raisins. For these purposes the undermentioned varieties of grapes are principally grown :—

Export and Table Grapes.—White and Red Hanepoot, Hermitage, Raisin Blanc, Barbarossa, Waltham Cross, Flame-coloured Tokai, Black Prince, Gros Colman, Rosaki, Molinera Gorda, Ohanez, and others.

Wine-making.—Green Grape, Hanepoot, Hermitage, Steen, White French, and others.

Brandy.—All wine varieties, Folle Blanche, Colombard, St. Emilion, Jurancon.

Raisins and Currants.—Hanepoot, Sultana, Cape Currant.

Dried Wine Grapes.—Hermitage, and other Wine-making varieties.

(v) *Table Grapes.*—Large quantities of table grapes have of late years been exported, and this branch of industry has developed into a flourishing trade and has a great future.

(vi) *Wine, Brandy and Vinegar.*—The Dutch introduced vines chiefly for the purpose of brandy-making, brandy being a valuable article of commerce ; but on the arrival of the Huguenots in 1688 wine-making also was taken up seriously. The natural conditions in South Africa led to the production of a heavy type of wine, as well as of sweet wines. German and Austrian experts engaged by the Cape Government advocated the making of light wines, but the advance in this direction was slow. It is only during the last twenty years that this branch of the industry has progressed, and some excellent light wines are now produced in the Union. Towards the end of 1920, owing to speculation and the absence of a fixed maximum price, the price of wine rose to a prohibitive figure, resulting in some firms being forced into liquidation and others being financially weakened. At the same time consumption was considerably reduced in consequence of high retail prices. This brought about a large surplus which could not be disposed of. Farmer members could only sell to contracting merchants who had the control of the retail trade in their hands and kept prices high in order to make good the losses sustained in previous years. To try and save the situation the Co-operative Association (Ko-operatieve Wynbouwers Vereniging van Zuid-Afrika, Beperkt) decided to erect a plant for turning out motor fuel from wine spirits. As only wine of an exceptionally low value can be used for this purpose, it was soon evident that the high cost of transport would render it impossible to distil the bulk of the surplus into motor spirit. Consequently it was decided to destroy the surplus in the

outlying districts. In order to obviate a continuation of this waste, the Co-operative Association strongly advised farmers to turn as many grapes as possible into raisins and as an inducement offered to pay a premium under certain conditions for each pound of raisins exported. In 1925 a flat rate of ½d. per pound of raisins was given as a premium over and above what the farmer received from the merchant. To induce farmers to establish an export wine trade the "Ko-operatieve Wynbouwers Vereniging" agreed to supply spirits from its surplus stock to farmers for the production of sweet wines at a nominal price provided such wines were exported to Europe. In order to safeguard the industry and ensure that the quality exported would be of a high standard, the Government brought a regulation into force in 1924 which stipulated that no wine might be exported to the United Kingdom unless it was at least 18 months old, and any wine for export to the United Kingdom or Europe must be approved of by Government officials, who give a certificate to the effect that the wine is of the required quality.

Table (*a*) below shows the quantity of wine, brandy, and vinegar made on farms during a series of years, and Table (*b*) the quantity and value of wine exported from and imported into the Union from the year 1910 :—

The brandy industry of South Africa is as old as the wine industry. Formerly, only two kinds of brandy were recognized, viz., dop and wine brandy. Dop brandy was so known from the Dutch word *dop* (husk), which signified that the brandy was obtained from the distillation of *doppe* together with wine, or piquette. The distillation of husks and piquette mixed is now practically prohibited; a discriminating excise duty of 22s. 6d. per proof gallon is imposed. The brandy produced from the distillation of husks and wine

mixed has taken the name of grape brandy, which is somewhat of a misnomer. On this brandy an excise duty of 17s. 6d. per proof gallon is levied, which means that it is practically out of the market, as the excise duty on pure wine brandy is considerably lower, i.e. 12s. 6d. per proof gallon.

Perhaps in no other country is the distillation of husks so suppressed as in South Africa. It is hoped that the purity of South African brandy will in time be recognized, and create a high standard on the world's markets. The Union adulteration laws, both with regard to brandy and to wine, are stringent.

Table (*c*) hereunder gives particulars of the production, importation, and consumption of brandy in the Union from the year 1910 :—

* As given in Excise Reports.

(vii) *Raisins and Currants.*—Both loose and stalk raisins are produced in the Union. The raisin produced from the Sultana grape is an excellent article, and has completely supplanted the imported commodity. *Hanepoot* and *Muscat d'Alexandrie* raisins have not as yet reached the standard of the imported article, but are improving rapidly. 6,983,515 lb. of raisins were exported during 1921 (to the value of £179,599), 11,878,355 lb. in 1922 (to the value of £249,412), 5,336,884 lb. in 1923 (to the value of £87,057), and 6,666,015 lb. in 1924 (to the value of £93,144).

The real *Zante Currant* grape was not imported into the Union until 1916. The Cape currant is a kind of dwarf Muscadel, and possesses a pleasing flavour, but is not cultivated on a large scale.

The subjoined table gives particulars of the quantities of raisins and currants produced on farms during a series of years :—

RAISINS AND CURRANTS PRODUCED ON FARMS, YEARS 1903-04 TO 1923-24.

2. Fruit Cultivation.—(i) *Fruit Growing.*—The fruit-growing industry in the Union dates back to the early days of the occupation of the Cape, when it was found at once that the soil and climate were well adapted for the purpose of fruit cultivation. Nevertheless, there was no great advance in the industry until the closing years of the nineteenth century, by which time, as the result of the gradual development of fruit growing, particularly in the Western Province of the Cape of Good Hope, production of large quantities of soft fruits, such as grapes, peaches, apricots, plums, and pears, in excess of domestic requirements, had been reached. There thus came into existence an export trade, at first on a small scale—in 1900, some years after its initiation, shipments to the extent of no more than 309 tons were made—but increasing as the industry developed and the trade became better organized, until by the year 1910 the shipments had reached a total of 2,705 tons. Since that time the export of fruit has still further increased. The consumption of fruit in the Union is very great, especially in the mining areas, and plantings are being considerably extended, particularly of citrus fruits and pineapples, for the cultivation of which large areas are well suited. The principal fruits exported from the Cape Province are peaches, pears, plums, apricots, nectarines, oranges, naartjes, pineapples, melons, and grapes; from the Transvaal, oranges, naartjes, grape fruit, and mangoes; from Natal, oranges, naartjes, pineapples, bananas, mangoes, avocado pears, with a few early plums; and the Orange Free State, pears, peaches, apples, and a few cherries. These fruits are the kinds chiefly sent oversea; but the following list also includes other varieties grown in the several Provinces. The range of fruit produced in the Union is due to variations in altitude, rising gradually from a long line of coast to between 6,000 and 8,000 feet above sea-level. It may be said that there is no spot in the Union where some known fruit will not grow and thrive.

VARIETIES OF FRUIT GROWN IN THE UNION ON A COMMERCIAL SCALE.

Apples.	Guavas.	Papaws.
Apricots.	Lemons.	Peaches.
Avocado Pears.	Limes.	Pears.
Bananas.	Litchis.	Pineapples.
Cherries.	Mangoes.	Plums.
Cape Gooseberries.	Melons.	Quinces.
Figs.	Naartjes.	Strawberries.
Grape Fruit.	Olives.	
Grenadillas	Oranges.	

(ii) *Fruit Export.*—The fruit export industry is governed by Regulations under the *Fruit Export Act* of 1914, the effect of which is to maintain a high standard of quality in all fruit exported. In order to place the organization of the industry and of the fruit export trade on a stable basis, and with the object of eliminating the shipment of waste and inferior fruit, likely to bring the South African product into disrepute, a South African Fruit Growers' Exchange was formed in December, 1921, including fruit growers in all parts of the Union and Rhodesia. The deciduous fruit industry is organized for export purposes in the Western Province Central Deciduous Co-operative Company, Ltd., which was formed in 1924. Revised regulations governing the export of fruit were published in December, 1922, and April, 1923.

The following tables contain the results of a special census, taken in 1925, of deciduous and citrus fruit trees, the fruit of which is grown particularly for purposes of export :—

SPECIAL CENSUS OF FRUIT TREES THE FRUIT OF WHICH IS GROWN FOR EXPORT, 1925.

‖ All districts, including Urban Areas.

In view of the importance of the export trade in citrus fruit, and the necessity for proper organization and full information, particularly in connection with the provision of adequate shipping accommodation, a special census of citrus trees, the fruit of which is grown in the Union for export, was taken in 1922. The results were embodied in a table published in the sixth issue of this *Year Book*.

(iii) *Nuts.*—The walnut and the almond are the only nuts planted on a commercial scale in the Union. The supply of both is, however, quite unequal to the demand, and there is need and scope for heavy planting of walnut and almond trees, to the cultivation of which various districts are eminently suited. Some interest has lately been evinced in the pecan nut, which is apparently more successfully cultivated in Natal than in any other portion of the Union. Imports into the Union under the headings of *Almonds*, *Walnuts*, and *Other Edible Nuts* have averaged 632,855 lb., valued at £26,933 yearly, during the period 1910 to 1924 (cocoanuts and ground-nuts not included), the actual imports in 1924 being as follows, viz. :—Almonds, 365,767 lb., valued at £24,032 ; walnuts, 88,631 lb., valued at £3,263 ; and other edible nuts, 301,155 lb., valued at £8,367, representing a total value of £35,662.

(iv) *Canned Fruits.*—Canneries for fruit have been established principally at towns on or near the coast, partly on account of the better supply of suitable labour, and also on account of the more economical working possible in those localities. The article produced is uniformly good, and has much improved within the past few years. The chief centres of the industry are Durban, Port Elizabeth, and Cape Town, with the Paarl and Worcester districts of the Cape Province. The following table gives particulars of the quantity of canned and bottled fruit produced, imported, and consumed in the Union during the years 1915–16 to 1923–24 :—

CANNED AND BOTTLED FRUIT.—PRODUCTION, IMPORTATION, AND CONSUMPTION, 1915–16 TO 1923–24.

(v) *Dried Fruits.*—Dried fruits are produced for home consumption throughout a large portion of the Union. Production of dried fruits as an article of commerce is confined to the south-western portion of the Cape Province, except in the case of apples, which are put out in large quantities from the eastern portion of the Orange Free State. In addition to raisins and currants, there is an increasing production of prunes, pears, apricots, and peaches. Enormous strides have been made in recent years in the production of high quality dried fruits, and the South African product now compares favourably with that of any part of the world.

The following table (*a*) gives the quantity and value of dried fruit (excluding currants, raisins, and dates) produced in, imported into, and exported from the Union during the years 1915–16 to 1923–24.

Table (*b*) shows the quantities of the more important kinds of dried fruit produced on farms in the Union during the years 1910–11 and 1917–18 to 1923–24.

(*a*) PRODUCTION, IMPORTS, AND EXPORTS OF DRIED FRUIT (EXCLUDING CURRANTS, RAISINS, AND DATES) AND CANDIED PEEL, 1915–16 TO 1923–24.

(vi) *Jams.*—There is considerable production of jams, jellies, fruit juices, and pulp. The export figures for the years 1910 to 1917 reveal that the possibilities of the development of this industry are important, apart from any consideration connected with the War and the consequent disturbance of ordinary commercial conditions. The following table gives particulars regarding the production, importation, and consumption of jams and jellies during the years 1915–16 to 1923–24 :—

JAMS AND JELLIES.—PRODUCTION, IMPORTATION, AND CONSUMPTION, 1915–16 TO 1923–24.

3. **Fruit Export Control Act, 1925.**—The promulgation of the Fruit Export Control Act, 1925, marked a further development in the control of the Fruit Industry. Provision is made for the establishment of a Board of Control whose duties shall be :

(*a*) to control the export of fruit from the Union and the order of shipment of fruit at all ports of the Union ;

(*b*) to call for and receive from fruit producers estimates and other particulars of their intended exports ;

(*c*) to call for and receive from shipowners or their representatives information respecting the amount of space available on any ship appointed to call at any port of the Union ; and

(*d*) to perform such other functions in respect of the export and shipment of fruit from the Union as may be prescribed by regulation.

4. **Inquiry into Fruit Export Trade.**—In November, 1924, a Committee of Inquiry, comprising as members Messrs. W. Lategan (Chairman), W. J. Lamont, I. B. van Heerden, and R. R. Perrot, was appointed to investigate and report upon certain matters connected with the Fruit Export Trade.

The terms of reference were—

(i) Allocation of cold chamber space for citrus fruit on steamers, as between ports and as between shippers, during the present season ; how allocations were made ; what arrangements, if any, were made between the Fruit Growers' Exchange and shipping companies for such allocations ; what has been the action of the Shipping Committee of the Fruit Growers' Exchange, and under what authority did that Committee act ; what has been the effect of any arrangements made so far as growers are concerned ; and whether the Exchange acted in the interests of the growers.

(ii) Has fan-room space on steamers been increased at any of the South African ports to the detriment of growers, owing to shipping rivalry ; and, if so, to what extent, if any, was the Exchange responsible.

(iii) The feasibility, or otherwise, of making an allocation of shipping space to each port sufficiently in advance to regulate supplies and permit of a *pro rata* allocation to individual growers ; and whether fruit should be shipped in order of priority of arrival at a port.

(iv) Make such other recommendations as may be considered necessary in the interests of successful transport of export fruit from South Africa.

(i) *Allocation of Cold Chamber Space.*—The Fruit Growers' Exchange through its Shipping Committee had arranged early in the season for securing adequate and proper cold storage space on the homeward bound steamers of both the South African and Australian services, and in the allotment of the space thus secured decided that all fruit received for export should be shipped strictly in priority of arrival at the port of shipment. However, by the action of the Durban agent of one of the Australian liners, who, acting independently, allotted cold storage space for a considerable consignment of fruit to private shippers, the arrangements entered into with the Exchange were invalidated and disorganized, as it released the shipping companies from their undertaking to place the available cold storage accommodation at the disposal of the Exchange and reverted to the old practice whereby space was arranged between the shippers individually and the steamship agents. The Committee of Inquiry in its report recommends that some arrangement should be made between the shipping companies and a central authority, such as the Fruit Growers' Exchange, as representing the fruit producers, to control the shipment of all fruit from South Africa, and to ensure its being shipped in some established order of precedence. The Committee was impressed with the difficulties of shipment, and expressed an opinion that a considerable amount of unnecessary criticism could be avoided if the Fruit Growers' Exchange and its Shipping Committee gave more publicity to the work being done, and the difficulties which they were endeavouring to solve.

(ii) *Fan-room Space on Steamers.*—The Committee found ample evidence that the Exchange had taken up a firm stand against utilization of fan-room space for the transport of fruit, and was therefore opposed to the views of the Division of Botany. The Union-Castle Company had fallen in with the suggestions of the Division and had provided fan-room space as being less expensive and taking up less room than cold storage chambers. The Company asked the exporters, in the circumstances, to give the system a trial, as it was obvious that the steamers which were required to convey the various products of South Africa could not be fitted up entirely with refrigerator space. It was found that up to the 31st October, 1924, less fruit had been shipped in the fan-room than in 1923, but the Committee commented upon the high proportion of fan-room space allotted to the intermediate coast ports between the 20th June and 25th July. The percentage of quantities shipped in the fan-rooms during that period were: Cape Town, 14·1; Mossel Bay, 62·2; Port Elizabeth, 46·0; East London, 37·5; Durban, nil. During this time more fruit arrived at the ports than was anticipated, and the alternative to shipping in ventilated space was the riskier expedient of placing the fruit in harbour stores possessing no suitable storage facilities. The Committee was strongly opposed to the shipment of fruit in ventilated holds, as, in their opinion, it would have the effect of retarding the fruit industry of the country, and they, therefore, recommended its discontinuance.

(iii) *Allocation of Shipping Space and Recommendations.*—The Committee found that the Exchange had endeavoured in the past to obtain information from fruit growers as to the quantity of fruit for export, but whether from apathy or opposition, few growers complied; and even of the returns received, many were found inaccurate and unreliable. Obviously the allotment of shipping space in the absence of forecasts as to quantities is impossible to arrange, and it is recommended that the rendering of returns should be made compulsory, and in the event of failure to submit an estimate, any fruit forwarded for transport, when space is limited, should be refused shipment. The Committee reported against any proposal to ship on a *pro rata* basis, for which it gives cogent reasons, and recommended the insertion of a clause in the Fruit Export Regulations that all fruit for export be shipped strictly in order of priority of arrival at the ports. No preferential treatment should be given to any kind or class of fruit.

Amongst other matters touched upon as affecting the fruit industry, the Committee mentions the lack of proper cold storage accommodation at Port Elizabeth and East London. The hinterland of the former port will produce large quantities of both deciduous and citrus fruits in the near future, and it is, therefore, desirable that the question of providing adequate and suitable storage and pre-cooling facilities should be placed in the foreground of its harbour improvements. (U.G. 19—'25).

5. **Pre-cooling Chambers, Cape Town Docks.**—The General Manager of Railways, in his Report for the year ended March, 1925, states that the Railway Administration's chambers for pre-cooling export fruit was extended during the year 1924, doubling the previous storage capacity. The chambers are now capable of dealing with 900 cubic tons of fruit.

Further works estimated to cost £134,492 are in course of construction at Table Bay Docks. The south shed on the East Pier has been reconstructed and equipped with cold storage chambers, having a capacity of 1,575 cubic tons; by bridging the gap between the north and south sheds further provision will be made, and a further storage capacity of 787 cubic tons added.

§ 7. Sugar-Cane.

1. Sugar Industry.—(i) *Historical.*—The first sugar mill was erected at Compensation, Victoria County, in 1849. By 1860 sugar-cane cultivation had made considerable progress in Alexandra, Durban, and Victoria Counties, and a number of small mills were in operation. A fair proportion of these mills were steam driven, but in a number of cases ox gear and water power were still used. The largest mill had not more than 40 horse-power.

For a number of years the progress of the industry was retarded by various factors, such as fluctuating prices, competition from Mauritius, disease among the "soft" varieties of cane, lack of suitable transport facilities, and a restricted market.

The development of the gold mining industry in the Transvaal caused some expansion of the market for Natal sugar between 1880 and 1889, and the joining up of the Natal and Transvaal railways further improved the position. The outbreak of the Anglo-Boer war led to a greater local demand with resultant higher prices and increased cultivation. About this time a number of the small mills closed down while those which continued operations, introduced modern machinery and increased their capacity.

For some years after 1904 the industry suffered severely from the dumping of German beet sugar and the acreage of cane reaped showed a steady decline. During this period, however, owing to favourable climatic conditions there was an increase in the average output of sugar per acre and the effects of German competition were thus to some extent mitigated.

In 1905 the first sugar lands were taken up in Zululand. The first harvest of cane was reaped there in 1908, when about 2,000 acres were cut. These lands and two further areas were allotted to prospective planters entering contracts to supply mills erected under ninety-nine year leases. During 1924 a further area north of Somkele was allotted partly for cotton and partly for sugar, the settlement being, however, of an experimental character, as the climatological conditions have still to be proved suitable for sugar.

With the completion of a customs convention between all the South African States in 1903, Natal obtained a position of preference against Mauritius and overseas sugar, and importations from these sources fell off as the Natal output increasingly met South African demand.

From 1910 to the outbreak of the War Natal encountered increasing competition by Mozambique in the Transvaal market. Under the terms of the Convention of 1909, sugar imported from that territory was not liable to Customs duty. This concession, combined with more favourable climatic and labour conditions, placed Mozambique in a good position to compete with Natal. Since 1914 the supplies of sugar from Portuguese East Africa have fluctuated considerably.

Mozambique manufacturers had the choice of overseas markets during the War, and when opportunity offered through conjunction of high prices and available freight, they left the less profitable market of the Transvaal to Natal. Since July, 1923, the clauses of the Convention affecting sugar have been inoperative, and during the season 1923–24 Mozambique sent no sugar to the Transvaal. By the year 1915 Natal's output had overtaken South African demand, and during the years following considerable quantities had to be exported. For the season 1923–24 the output totalled 203,360 tons, the largest in the industry's history.

The expansion of output since 1910 was due in some measure to the steady development of Zululand; but Natal proper contributed largely by bringing under cane, land which was in other crops (such as tea) and land hitherto undeveloped. In 1917–18 Natal had 128,460 acres under cane, while Zululand had 55,184 acres. In 1924–25 Natal's acreage had increased to 140,480 acres, and Zululand's to 76,492 acres. There is still available and suitable for sugar-cane, on farms presently occupied by planters, 43,000 acres in Natal and 55,000 acres in Zululand.

(ii) *Varieties of Cane Cultivated.*—Prior to the introduction of the *Uba* variety, a number of so-called "soft" varieties were cultivated. Owing to the ravages of disease, which threatened to extinguish the sugar industry, endeavours were made to obtain more suitable varieties of cane from various sugar-growing countries. Among the varieties thus introduced was the *Uba*, which is now universally grown on all the Natal sugar estates. It is very hardy, deep-rooting, drought- and disease-resisting, and gives from four ratoon crops upwards. An objection to its use from a milling point of view is that it requires considerably more power to mill, being tough and of high fibre-content. The dead leaves (trash) adhere to the cane very firmly, while in the soft varieties the trash falls away by itself. Recently a variety of *Agaul* from India has given very promising results. It is a cane similar in many respects to the *Uba* variety. Recent investigation has shown that *Agaul* and all so-called "soft" canes, of which there are only about 400 acres altogether spread over the sugar belt, are suffering from *Mosaic disease*, and measures are being taken to deal with this visitation. *Uba* is to all appearance immune to *Mosaic*, but some anxiety has been occasioned by a report that a streaked appearance of the leaf in young plants, which has been noticed for a good many years and was put down to climatic influences, is really a disease which is spreading. The industry is in course of establishing an experiment station to deal with disease problems and generally investigate all cultural and milling problems.

(iii) *Yield of Cane.*—Sugar-cane yields about 20 tons per acre in Natal every two years, but in Zululand, owing to the larger rainfall and the richer lands, the yield is somewhat higher, and the return somewhat earlier. Cane grown on the hills is reputed to have a higher sucrose-content than that grown on the flats. Improvements in milling have resulted in the lessening of the amount of cane required to produce 1 ton of sugar. In the dry winter months when the juice undergoes concentration, on the average 11 tons of cane are necessary for the production of 1 ton of sugar. Several mills have brought this figure below 10 tons. The *bagasse* is used as fuel, and the *sludge* from the filter-presses and the liming of the juice are returned to the cane-fields as manure, or disposed of for the extraction of the wax it contains.

(iv) *By-Products.*—The most important by-product, *molasses*, is now being exported, and is used locally for stock-feeding. Motor spirit, *natalite*, is also being produced at the present time from molasses, also rectified and methylated spirits, as well as commercial and anaesthetic ether. *Cane wax* is not exploited to any great extent, though there are said to be great possibilities in this direction.

(v) *Sugar Mills.*—The industry is well provided with mills, and in Natal proper the owners of these (with one or two exceptions) for the most part crush cane grown by themselves. In Zululand the mills are situated in the centre of a large area of sugar plantations, from which they obtain all the cane they can crush, the price being regulated by the price of refined sugar in Durban. This system came into force in 1905, when the Natal Government opened the coast belt of Zululand for the cultivation of the sugar-cane, and agreements were then entered into for the erection of mills and for the supply of cane to the millers by planters allotted land on the concession. In December, 1921, a Commission, under the chairmanship of Mr. W. D. Baxter, was appointed to inquire into the sugar industry, and its report, issued in May, 1922, included the following recommendations :—

(*a*) That the agreements between millers and planters in Zululand should be revised, as they are detrimental to the interests of both, in that cane is paid for by weight irrespective of the sugar it contains, and in that the same rate is paid for unburnt cane as for burnt cane.
(*b*) That mills which are able to crush all the cane available should be allowed to shorten the milling season.
(*c*) That a new basis of payment other than that of the price of first refined sugar in Durban should be provided, and that this basis should be uniform throughout Natal.

During the year 1925 the Board of Trade and Industries, following on allegations of dumping from the United States and Mozambique, conducted an investigation of a very thorough character into the industry. The report, serial No. 66, was issued on the 14th April, 1926.

The mills usually work between the months of May and December, when the sugar-content of the cane is at its optimum. At present there are twenty-one mills in operation in Natal proper and four in Zululand.

(vi) *Sugar Refineries.*—In 1922 there were two refineries in Natal which dealt with the "cargo" sugars produced by the mills. These refineries are necessary adjuncts to the industry, as there is a demand for refined sugar which, in the absence of the South African article, would be supplied by imported refined sugar. One refinery was closed down in January, 1923, but was reopened during 1924. Important additions are being made to one of the existing refining plants, while an additional refinery is in course of erection at Illovo. High-class mill sugar is now being produced which rivals refined in quality.

(vii) *Labour.*—At one time the labour employed in the sugar industry was mostly Indian, but during recent years the proportion of Indians has rapidly decreased. At present the great majority of the labourers employed both on the estates and in the mills are natives. It has been found impossible to obtain an adequate regular supply locally and arrangements have therefore been made for recruiting outside the borders of Natal. The industry employs about 40,000 natives during the cutting season.

Europeans are employed on the large estates as managers, chemists, engineers, and overseers. In the mills and refineries, according to the latest industrial census returns, over 600 Europeans are employed, mostly on work of a scientific or technical nature.

(viii) *Price of Sugar.*—The following statement gives the average price (including £1 excise duty) of first refined Natal sugar per ton (2,000 lb.) at Durban from 1910–11 to 1924–25 :—

Year.	Price.	Year.	Price.	Year.	Price.
	£ s. d.		£ s. d.		£ s. d.
1910–11.....	17 4 3	1915–16.....	19 8 6	1920–21.....	46 11 6
1911–12.....	18 1 6	1916–17.....	20 7 5	1921–22.....	29 3 5
1912–13.....	16 5 4	1917–18.....	25 9 0·9	1922–23.....	22 16 9
1913–14.....	16 1 9	1918–19.....	23 5 9·6	1923–24.....	29 12 7·6
1914–15.....	18 4 10	1919–20	26 6 4·8	1924–25.....	24 6 5

From 15th June, 1917, the price of sugar was fixed from time to time by Government Notice, first under the *Moratorium Act* and later under a special temporary Act (No. 13 of 1922), which expired on 30th June, 1923. Particulars of the prices fixed from time to time in terms of this legislation will be found in the sixth issue of this *Year Book*.

2. Statistics.—The area under cane cultivation by Europeans at 30th June, 1918, was 184,213 acres, at 30th April, 1921, 196,585 acres; at 30th April, 1923, 211,363 acres; and at 30th April, 1924, 201,170 acres.

The following table shows the quantity of sugar produced in, imported into, and consumed in the Union from the year 1910–11 :—

SUGAR.—PRODUCTION, IMPORTS, EXPORTS, AND CONSUMPTION, 1910–11 TO 1923–24.

Year.	Production.†	Net Imports.	Exports South African Produce.	Retained or Available for Consumption.	Sugar used in Manufacturing.
	Tons—2,000 lb.	Tons—2,000 lb.	Tons—2,000 lb.	Tons—2,000 lb.	Tons—2,000 lb.

* This is exclusive of the Indian and native production, which, however, represents only about 6 per cent. of the total production.

§ 8. Tea, Cotton, and Tobacco.

1. **Tea.**—Tea was first grown in the area now comprising the Union as an experiment at the Durban Botanical Gardens in the year 1851. For a long period the industry was conducted on experimental lines, but without success. In 1878 greater attention was paid to tea growing, and some two thousand plants were procured from Assam by Mr. J. L.

Hulett (now Sir Liege Hulett), and planted out on his estate at Kearsney in Natal. The first crop (of 30 lb.) was raised in 1880. In 1883, tea produced on the estate referred to was valued at 2s. 9d. per lb. in London. The price of tea in South Africa at that time ranged from 2s. to 3s. 6d. per lb. From that year the tea industry advanced, and with increased production the price fell to about 1s. per lb., during the period 1904 to 1909.

The restrictions placed on Indian immigration into Natal by the Government of India in 1911 have seriously hampered the industry; and as a result of the low price of tea and the present high cost of labour, equal to about 45 per cent. of the total cost of production, the industry has contracted. Capital to the approximate amount of £350,000 is invested in the tea industry of the Union. The yield of manufactured tea in 1920–21 was 913,751 lb. In 1903 the highest total of production—2,681,000 lb.—was reached. The annual consumption of tea in the Union is in the neighbourhood of 8,000,000 lb. It is estimated that at least 15,000 acres of land suitable for tea plantations are available. The plucking season lasts from September until June. Six estates are engaged in the growing and production of tea, and it may be stated that Natal tea is particularly free from tannin.

Owing chiefly to the labour difficulties mentioned, it is found that in Natal the growing of sugar-cane is generally more profitable than the cultivation of tea, with the result that the former industry is being extended at the expense of the latter. The following table gives particulars of the area of tea plantations, the produce in green leaf and in manufactured tea, and the consumption of tea in the Union.

TEA.—PRODUCTION, IMPORTATION, AND CONSUMPTION, 1910–11 TO 1923–24.

Year (Season).	Area Cultivated.	Yield (Green Leaf).	Manufactured Tea.	Production (less Exports).	Imports. (less Re-exports).	Retained or Available for Consumption.

2. **Cotton.**—The cotton industry of the Union is in the earliest stage of development, but the possibilities of its extension are considerable. It may be remarked that the production of cotton in South Africa was first attempted more than fifty years ago in some of the eastern coastal districts of the Cape of Good Hope and in Natal, and that the attempt continued for a decade. Notwithstanding a good deal of encouragement by the Government and by Chambers of Commerce, however, the endeavour to establish cotton-growing as an industry failed, principally on account of labour difficulties, the high cost of ocean transport, and the lack of cultural knowledge. In 1910, when the Government of the United Kingdom and the cotton manufacturers of England held out inducements for the cultivation of cotton within the British Empire, the Government of the Union decided to make another effort to interest farmers in cotton production. A series of experiments was started in the areas considered likely to prove most suitable, and as a consequence the industry has now taken new life. Improved ginning facilities have been established, cheaper transport has been obtained, and several ginning plants are now in operation.

The year 1922–23 showed an increase of 119 per cent. over the previous year, giving a total yield of 2,400,000 lb. of lint. Since the revival of the industry, practically every year has shown a gain over the previous season. Now that there is such a widespread interest in cotton culture in the Union, if only prices remain firm, there should be a big increase in the acreage during the next few years.

It has been concluded, as a result of these years of experiment, that the *American Upland* varieties give most satisfaction, and the consignments exported to the United Kingdom usually command from one penny to threepence per lb. more than American middlings.

The following table gives figures showing the production of cotton in the Union:—

SEED COTTON (UNGINNED) GROWN IN THE UNION,* 1917-18 TO 1923-24.

* Native locations, reserves, etc., not enumerated.

3. Tobacco.—The principal tobacco districts in the Union are the Magaliesberg and Kat River districts, which produce a light and medium tobacco of the Virginian type, such as *Joiner, Yellow Prior, Sterling, Tennessee Red,* and *Swazie*; the Potchefstroom, Vredefort, Piet Retief, Oudtshoorn, and Piquetberg districts, which produce a medium to heavy type, such as *Tennessee Red, Sterling, Clarksville Heavy,* and *Swazie*; the Stellenbosch, Wellington, and Tulbagh districts, which produce Turkish tobacco such as *Soulouk*; and Natal, in which Province a medium dark type, largely consumed in the manufacture of cigars, cheroots, and a cheap grade of pipe tobacco, is produced.

The tobacco and tobacco manufacturing industries have experienced considerable change in the class of leaf and manufactured article required by the public during the past ten to fifteen years, i.e. from the heavy type tobacco to the light cigarette tobacco leaf. In the earlier days the principal demand was for dark and medium tobacco, suitable for ultimate conversion into pipe tobacco and snuff. A fairly large percentage of the crop was put up by the farmers into roll tobacco, the rolls being converted into pipe or snuff tobacco by the consumer. There is still a considerable quantity of roll tobacco produced, both by the farmers and by factories. During more recent years factories for the manufacture of cut pipe tobacco and cigarettes have been established throughout the Union, and an increasing demand for tobacco of light or medium colour and fine or medium texture has arisen. During this period the manufacture of cigars and cheroots has made some progress, and several small factories are in operation. This factor has encouraged the production of a type of leaf suitable to the manufacture of cigars and cheroots. Moreover, cigarettes made from locally grown Turkish tobacco have become very popular, and the production of colonial Turkish leaf has been firmly established. Prior to the European War a considerable quantity of tobacco was imported, comprising Sumatra for cigar wrappers, and Turkish and Virginian for cigarettes. There are five tobacco co-operative societies at present in the Union registered under the *Co-operative Societies Act*; three of these have unlimited liability and two limited liability. All five embody the principles of co-operation. Only *bona fide* tobacco farmers may be members of the co-operative societies or hold shares in the tobacco companies. All the members share *pro rata* the profits accruing after deduction of working costs, and members are required to deliver their tobacco crops to the organization.

The Rustenburg Farmers' Co-operative Society was inaugurated in 1911 and has been completely successful and of great value to the tobacco industry.

The Western District Warehouse Association of Paarl, Cape of Good Hope, which has been in existence for nine years, has been of considerable assistance to the Turkish tobacco farmers, and has succeeded in putting on the market a matured article which has much improved the position of the manufacturers of colonial Turkish cigarettes. The association handles annually some 250,000 to 600,000 lb. of tobacco.

The Vaal River Tobacco Farmers' Company, Ltd., was inaugurated in 1918, and was converted into a co-operative company in 1921.

The spread of a bacterial disease known as wildfire (*Bacterium tabacum*) has caused considerable loss to the farmers, amounting probably to 10 per cent. of the 1922 crop.

The following table gives particulars as to tobacco grown in the Union :—

TOBACCO GROWN IN THE UNION, 1911 AND 1918 TO 1924.

Year.	Cape of Good Hope.		Natal.		Transvaal.		Orange Free State.		Native Locations, Reserves, Etc.	Union.

* Included in Provinces. † Exclusive of tobacco produced in Native Locations, etc., which amounted to 2,428,553 lb. in 1918, and 1,614,400 lb. in 1921. ‡ Area not enumerated.
§ Including Turkish Tobacco, 1923, 518,768 lb.; 1924, 816,099 lb. Before 1923 Turkish Tobacco was included with other tobacco.

§ 9. Valuation of Agricultural and Pastoral Production and Prices of Farm Products.

1. **Valuation.**—The following statement gives the estimated value of the agricultural and pastoral production of the Union for the seasons 1917–18 to 1923–24. The valuation is based upon the average wholesale or open market prices for the Union in each season. The estimated value of fodder crops used on farms has been deducted. A separate valuation at *farm* prices was effected for the years 1920–21, 1922–23, and 1923–24, and amounted to £48,673,000, £53,293,000 and £54,961,000 respectively. Valuations on this basis are being effected for preceding and following years :—

VALUATION OF AGRICULTURAL AND PASTORAL PRODUCTION, AT WHOLESALE AND OPEN MARKET PRICES, 1917–18 TO 1923–24.

Union.		Provinces, 1920–21. (Complete Census)	
Season.	Value.	Province.	Value.
	£1,000		£1,000
1917–18	63,559	Cape of Good Hope	26,819
1918–19	67,088	Natal	9,826
1919–20	95,596	Transvaal	14,155
1920–21	62,233	Orange Free State	11,433
1921–22	55,042		
1922–23	67,989		
1923–24	67,263	Union	62,233

2. **Market Prices of Farm Products.**—The subjoined table reflects the average prices of farm products (wholesale or open market) in the Union during the years 1918 and 1920 to 1924 :—

MARKET PRICES OF FARM PRODUCTS, 1918, AND 1920 TO 1924.

Produce.	1918.	1920.	1921.	1922.	1923.	1924.
Wheat per bag (200 lb.)	36s. 3d.	63s. 0d.	33s. 0d.	25s. 3d.	25s. 10d.	26s. 10d.
Rye, per bag (200 lb.)	26s. 7d.	37s. 9d.	27s. 10d.	16s. 1d.	17s. 2d.	20s. 10d.
Barley, per 100 bundles	6s. 11d.	9s. 4d.	12s. 10d.	7s. 10d.	7s. 0d.	17s. 0d.
Barley, per bag (150 lb.)	11s. 4d.	27s. 7d.	17s. 3d.	12s. 6d.	11s. 11d.	14s. 6½d.
Oats, per bag (150 lb.)	13s. 11d.	28s. 4d.	13s. 0d.	12s. 1d.	12s. 0d.	12s. 8d.
Oat-hay, per 100 lb.	6s. 1d.	13s. 7d.	6s. 1d.	5s. 10d.	5s. 7d.	6s. 9d.
Manna Seed, per bag (100 lb.)	19s. 6d.	44s. 0d.	36s. 6d.	16s. 4d.	14s. 8d.	17s. 5d.

Raisins (stalk) per lb.	10d.	1s. 2d.	9d.	1s. 3d.	6d.	7d.
Raisins (loose), per lb.	5d.	6d.	5d.	6½d.	3d.	3½d.
Raisins (Sultanas), per lb.	9½d.	9d.	8d.	8d.	6d.	5d.
Currants, per lb.	1s. 1d.	1s. 4d.	1s. 3d.	1s. 0d.	10d.	10d.

§ 10. Farms, Farm Labour, and Agricultural Implements.

1. **Number, Tenure, and Area of Farms.**—The following table gives particulars of farms enumerated at the Census of Agricultural and Pastoral Production from 1921 (excluding native locations, reserves, etc.).

NUMBER AND AREA OF FARMS, AGRICULTURAL HOLDINGS, PLANTATIONS, AND FOREST RESERVES (EXCLUDING NATIVE LOCATIONS, RESERVES, ETC.), APRIL, 1921, 1922, AND AUGUST, 1923 AND 1924.

Province.	Number of Occupied Farms at			Number and Area of Occupied Farms at 31st August, 1924.	
	30th April, 1921.	30th April, 1922.	31st Aug., 1923.	Number.	Acres.
Cape of Good Hope	31,950	34,221	34,142	34,809	124,814,440
Natal	8,697	9,314	9,594	9,687	10,396,641
Transvaal	22,741	24,471	24,869	25,331	36,848,890
Orange Free State	18,044	17,236	17,318	18,513	30,191,188
TOTAL	81,432	85,242	85,923	88,340	202,251,159

A table giving the area of farms, the area cultivated, irrigated and irrigable at the 30th April, 1921, will be found in the sixth issue of this *Year Book*.

At the 30th April, 1922, the acreage under cultivation (exclusive of native locations reserves, etc., not enumerated) was: Cape, 3,131,719; Natal, 1,074,235; Transvaal, 3,289,664; Orange Free State, 3,195,660; Union, 10,691,278.

At the 31st August, 1923, the acreage under cultivation was: Cape, 2,914,359; Natal, 998,492; Transvaal, 2,862,428; Orange Free State, 3,086,684; Native Locations, Reserves, etc., 3,331,711; Union, 13,193,674.

At the 31st August, 1924, the acreage under cultivation (exclusive of native locations, reserves, etc., not enumerated) was:—Cape, 3,114,105; Natal, 1,057,870; Transvaal, 3,053,901; Orange Free State, 2,870,303; Union, 10,096,179.

2. **Employees on Farms.**—Particulars were given in the sixth and previous issues of this *Year Book*, as to the average number, sex and race of employees on farms, excluding native locations, reserves, etc., during the year 1917–18.

3. **Agricultural Implements, Machinery, etc.**—Particulars as to agricultural implements and engines employed on farms in the years 1918 and 1921 will be found in the sixth issue of this *Year Book*.

§ 11. Fertilizers.

1. **General.**—The *Fertilizers, Farm Foods, Seeds, and Pest Remedies Act* (No. 21 of 1917) regulates the importation and sale of fertilizers in the Union. "Fertilizer" is defined as any substance containing, or purporting to contain as chemical constituents thereof, nitrogen, phosphoric oxide, potash, or lime in a form or combination available as plant food, and sold or intended for sale for the purpose of fertilizing the soil or supplying nutriment to plants, and the sale of an article not containing these ingredients in a suitable form is prohibited.

From analyses of South African soils it has been established that they are for the most part deficient to a smaller or greater degree in the four essential elements enumerated, and it is these necessary constituents which have to be supplied by means of fertilizers.

Phosphoric Oxide, in which the deficiency is largest, is added to the soil chiefly in the form of superphosphates, basic slag, and bone preparations. Considerable phosphatic deposits occur in various parts of the Union (Weenen, Saldanha Bay, Kuruman, Murchison Range, and Bethlehem), and in recent years the production of superphosphates has been undertaken on a very considerable scale. At Somerset West, in the Cape Province, and at Umbogintwini and other places in Natal, there are factories said to be capable of an output more than sufficient to satisfy the present South African demand for superphosphates and bone manure. *Lime* deposits are found extensively in the Union, and a suitable form for fertilizer purposes occurs in the Marico District. The principal varieties of *nitrogenous* fertilizer in use in South Africa are sulphate of ammonia, nitrate of potash, blood-meal, meat-meal, and different forms of guano. For the most part these are locally produced, the municipal abattoirs of Durban, Cape Town, Pretoria, and Johannesburg being responsible for the preparation of considerable quantities of blood-meal and meat-meal, while guano (bird, whale, fish, and bat) is extensively worked up and used. *Potassic* fertilizers are imported in the shape of salts of potash, and there is also a considerable production in the Union, burnt kraal manure ("Karroo ash") being largely utilized in this connection.

The following tables give (i) the imports into the Union of various types of fertilizer during a series of years, and (ii) the factory production of fertilizers in the Union, as shown in recent Industrial Censuses:—

(i) MANURES AND FERTILIZERS—IMPORTS, 1922 TO 1924.

Description.	1922.		1923.		1924.	
	Quantity.	Value.	Quantity.	Value.	Quantity.	Value.

TOTAL VALUE.....£	—	516,999	—	486,475	—	464,960

* Less than four establishments operating.

2. **Guano.**—This fertilizer, which is obtained from the group of Government Guano Islands situated along the west and south coasts of South Africa, is sold in a pulverized form, and is used principally in the cultivation of cereals and vegetables, but is also now being extensively employed in the treatment of young orchards and vineyards as well as the growing of maize and sugar-cane. Its principal chemical constituents are nitrogen, potash, phosphoric oxide, and lime, and, as the composition of the deposits obtained from the various islands varies materially in certain essentials, all collections are systematically mixed so as to obtain an approximately uniform grade of article.

The average analysis of guano sold during the years 1921 to 1924 was :—Nitrogen, 10·0 per cent.; potash, 1·8 per cent.; phosphoric oxide water soluble, 3·2 per cent.; phosphoric oxide soluble in 2 per cent. citric solution, 10·8 per cent.; total phosphoric oxide, 11·4 per cent.; and lime, 10·3 per cent. Guano is now being sold by the Government at £7 per ton, which is below its commercial value. There is a very large and increasing local demand for guano, and, as the supply is limited, no exportation to places beyond the limits of the Union is permitted.

Further particulars of the Government guano deposits will be found in the sixth and previous issues of this *Year Book*.

QUANTITY OF GUANO PRODUCED, 1911 TO 1924.

Year.	Colonial Group of Islands.	Northern or Ichaboe Group of Islands.	Total.
	Tons.	Tons.	Tons.
1911–15 (average)	2,618	4,145	6,763
1916–20 (average)	3,223	5,044	8,267
1921	3,275	5,240	8,515
1922	3,394	6,000	9,394
1923	3,515	6,581	10,096
1924	1,861	6,660	8,521

The following by-products of the Government Guano Islands may be conveniently noted here :—

Penguin Eggs.—The collection of penguin eggs is at present restricted to certain portions of Dassen Island only, from whence, on an average, about 500,000 eggs are obtained annually. The collection, disposal, and distribution of penguin eggs are undertaken by Government contractors.

Seal Skins.—The number of seal skins and the quantity of oil secured annually vary considerably according to circumstances. The average number of skins taken during the three years 1921 to 1923 was 10,960 per annum. These skins are shipped to the United Kingdom, and sold by auction on the London markets. The sealing industry is largely in the hands of the Union Government, and private enterprise is only permitted on certain specified islands and rocks on the South African coast reserved for that purpose.

§ 12. Agricultural Co-operation.

A brief history of the development of agricultural co-operation in the various Provinces of the Union is given in the sixth and previous issues of this *Year Book*.

There has recently been a great development of the co-operative movement in every Province of the Union, and farmers of all kinds are keenly interesting themselves in the

organization of co-operative marketing associations. A new Co-operation Act to regulate the constitution of co-operative agricultural societies and companies throughout the Union was passed during the 1922 Session. The *Co-operative Societies Act* (No. 28 of 1922) repeals all former co-operative laws and provides for the appointment of a Registrar of Co-operative Societies and for the formation and registration of agricultural co-operative societies with unlimited liability, agricultural co-operative companies with limited liability, and co-operative trading societies with limited liability. The Act further provides for the formation of central and federal co-operative companies, with objects generally similar to those of the co-operative societies and companies. Provision is also made in the Act for the management of societies or companies by boards of directors, and for the dissolution, voluntary or compulsory, of societies and companies. Lists of the names and addresses of directors and members of co-operative companies and societies must be transmitted to the Registrar. All the provisions of this Act are applied to every co-operative agricultural society registered under previous Acts. The First Schedule of the Act contains model regulations, which may be adopted by co-operative societies and companies. An Amending Act (No. 38 of 1925) was passed during the 1925 Session of Parliament and came into operation on the 30th July, 1925.

PARTICULARS OF REGISTERED CO-OPERATIVE SOCIETIES AND COMPANIES IN ACTIVE OPERATION AT 31st DECEMBER, 1923 AND 1924.

Description.	At 31st December, 1923.		At 31st December 1924.	
	Number.	Membership.	Number.	Membership.

TOTAL	210	40,717	256	38,257

§ 13. Agricultural Schools and Experiment Farms.

1. **Description of Establishments.**—Schools of Agriculture and Experiment Farms are established at several points in the Union. A brief description of these schools and farms and the purpose which they serve is given hereunder :—

(i) *Elsenburg* (*Mulder's Vlei, Cape of Good Hope*).—This was established in 1898 and is the oldest institution of its kind in the Union. The area of the farm and experiment station is approximately 2,600 acres, of which 900 acres are under cultivation. About 125 acres are devoted to vineyards and orchards. The special features of this institution are horticulture, viticulture and wine-making, cereal, and tobacco (Turkish) growing and dairying. An Oenological Institute has been erected here, at a cost of £6,000, for the study of wine-making. The area of operation includes the coastal district from Namaqualand to Knysna, and the districts of Ceres, Worcester, Robertson, Paarl, Tulbagh, and Montagu.

(ii) *Grootfontein* (*Middelburg, Cape of Good Hope*).—This station was established in 1911 on a large farm, in extent about 25,000 acres, acquired from the Imperial military authorities. The special features here are agriculture (including irrigation) under Karroo conditions, the rearing of ostriches, Merino sheep, and Angora goats. The area of operation embraces that portion of the Cape Province lying south of the Orange River (excluding the area served by Elsenburg) and the Transkeian Territories (excluding East Griqualand).

(iii) *Cedara* (*Natal*).—The Cedara experiment farm was established in 1902 and the school was opened in 1906. The farm is approximately 2,000 acres in extent. Cattle and farm dairying, maize, forestry (including wattle growing) form the special features at this experiment station, and the area of its operation extends to the whole of the Natal Province and East Griqualand.

(iv) *Potchefstroom* (*Transvaal*).—This experiment farm was established in 1902 and the school was opened in 1909. The farm comprises about 4,000 acres, some 800 acres of which are under cultivation. Matters relating to agriculture representative of high veld conditions, the cultivation of crops under irrigation and otherwise, stock breeding, and the growing of maize and other cereals are special features of this establishment, and its area of operation covers the whole of the Transvaal Province.

(v) *Glen* (*Orange Free State*).—Prior to the constitution of the Union no agricultural school had been established in the Orange Free State, and it was found that the existing Government farms were, in several important respects, unsuitable for such a purpose. In

1912, a farm of approximately 4,000 acres in extent was acquired at Glen, on which an agricultural school and experiment station has been established. The school was opened for students in February, 1919. The area of operation comprises the whole of the Orange Free State, that portion of the Cape Province lying north of the Orange River, and British Bechuanaland.

2. **General Particulars.**—All the above institutions are in close proximity to stations on main lines of railway and are fairly central as regards the areas they serve.

The farms on which the schools are situated are large, well stocked, well equipped, and representative of the agricultural conditions of their respective areas, and they enable the breeding of pedigree live stock and the cultivation of land to be undertaken on a suitable scale for the benefit of students and the improvement of the stock of the country. The laboratory and classroom accommodation and equipment provide suitable facilities for a sound training in the science of agriculture.

The institutions have on their staffs separate lecturers in Agriculture and Stock, Agricultural Engineering, Veterinary Science, Chemistry, Botany, Entomology, Dairying, Poultry Husbandry and Horticulture, and (at Elsenburg) Viticulture and Wine-making; while there are also experimentalists and itinerant instructors. In addition to their educational duties, the staff perform some extension, experiment, and research work, and it is contemplated that in due course three more or less self-contained branches will be developed at each institution for college work, experiment and research work, and extension work.

3. **Courses.**—The courses of instruction consist of:

(i) *Ordinary.*—Two years' Diploma Course: Animal Husbandry, Field Husbandry, Veterinary Science, Agricultural Engineering, Horticulture, Dairying, Poultry-keeping, Viticulture (at Elsenburg), Agricultural Economics and Law, Farm Book-keeping, Agricultural Chemistry, Agricultural Botany, Agricultural Zoology and Entomology.

(ii) *Special.*—

(*a*) Special course in Sheep and Wool, at the Grootfontein School of Agriculture, February to September.

(*b*) Special course in Dairying, at the Glen School of Agriculture, October to September.

(*c*) Special short courses in Shearing, Sorting, and Classing Wool, etc., at Glen and Grootfontein Schools of Agriculture, for members of Wool Growers' Associations and others interested.

(iii) *Short Vacation Courses.*—

(*a*) Short summer vacation course in Wine-making, one week, at the Elsenburg School of Agriculture.

(*b*) Short summer vacation course in Sheep and Wool, one week, at the Potchefstroom School of Agriculture.

(*c*) Short winter vacation courses at all the Schools of Agriculture, from June to August in periods of not more than six days for each course. These comprise special subject courses and general courses, and are designed to meet the needs in particular of farmers, their wives, sons, and daughters, and rural school teachers who are unable to devote more than a few weeks to acquiring some knowledge of the subjects taught. The lectures and demonstrations are specially prepared, so that those attending them may secure the greatest benefit in the short time at their disposal. Women are afforded the opportunity of attending the courses in Poultry, Dairying, Horticulture, and Apiculture, in addition to the courses in Domestic Science specially provided for them.

The ordinary course of two years is essentially one which gives a sound practical as well as a technical training to young farmers, but it does not offer a full training for the *agricultural expert* or the *agricultural scientist.* This work is conducted by the Agricultural Faculties of the University of Stellenbosch and the Transvaal University College, Pretoria. (See Chapter IV, § 1.) The special courses should provide for those who have already had some experience in these branches of farming, and who are, for various reasons, unable to take and to receive the full benefits of the two-year course. The standard of entrance for the two-year diploma course is the Junior Certificate or its equivalent; and for the special courses the above diploma or previous experience in farming. The minimum age of entrance is respectively 16 years and 18 years. At few such institutions are students given a better opportunity of acquiring some skill in field operations, the care and management of stock, and practical training in the workshops than at those in the Union.

**Training Farms.*—Two training farms are conducted—Beginsel, Standerton, and Mariendahl, adjoining Elsenburg School of Agriculture—for the purpose of affording a practical training to prospective settlers on the land. Including schools and training farms, there is provision for the training of upwards of 500 pupils at one time.

4. **Extension Work.**—Considerable further progress has been made in developing this class of work, and the extension lectures have been well received by the farming community. During the year ended 30th June, 1922, the staff of the agricultural schools undertook

* Working in conjunction with Elsenburg.

over seven hundred lectures and demonstrations, chiefly at agricultural shows, at meetings of agricultural bodies, and at other gatherings in rural districts. About 2,000 farms and poultry yards were visited by the staff for the purpose of giving to the owners or occupiers advice on the management or development of their propositions, and for the inspection of pure-bred herds and flocks for purposes of the Stud-Book. It is estimated that during the past financial year the school dealt with some 27,000 inquiries of farmers and others seeking advice and information upon subjects connected with agriculture.

5. **Demonstration Train.**—Since the 17th March, 1924, the Railway Administration has held a demonstration train at the disposal of the Agricultural Department. Originally the train consisted of wagons devoted to the following subjects: Tobacco and Cotton, Field Husbandry, Animal Husbandry, Entomology, Poultry, Sheep and Wool, Horticulture, and Domestic Science. Afterwards the train was supplemented by wagons for the following sciences: Veterinary, Chemistry, Botany, and Agricultural Engineering. The demonstration carriages of the train are consequently equipped to represent all the principal branches of farming, and when the train is on the road it is accompanied by fully qualified lecturers.

The train has made eight journeys between March, 1924, and the end of April, 1926, which means that, with the exception of a few districts, the whole Union has been visited and the majority of the Agricultural Exhibitions attended. Upon all these journeys the train has been fully equipped with all its carriages, principally for the purpose of advertising itself throughout the country. After another two or three similar journeys have been completed, it will undoubtedly become necessary to modify the proceedings in certain respects, especially with regard to methods, which are largely dependent upon local conditions.

So far all the journeys of the train have met with complete success. In the future the train will undoubtedly play an important rôle and be one of the principal means in the dissemination of useful agricultural knowledge.

6. **Experiment Work.**—A large part of the work on the farms attached to the schools is devoted to experimental work under the direction of specially trained officials. These farms are more or less representatively situated in the several Provinces, so that the requirements of the greater part of the Union are well covered. The experiments undertaken are both varied and comprehensive, and may be classed as follows:—

(i) *Animal Husbandry.*—Experiments are conducted in cattle feeding with different rations, instituted to encourage the export trade in beef; in pig and lamb fattening and calf feeding; in crossing pure breeds of cattle, pigs, and sheep with the object of evolving grade animals suited to local conditions; at the Grootfontein School of Agriculture in the crossing of the Cape and North African ostriches to improve the quality of ostrich feathers, and in the breeding of Karakul sheep.

(ii) *Field Husbandry.*—Experiments under this head deal mainly with trials of different varieties of field crops. New varieties are constantly being introduced from abroad and tested. The best among them are retained, distributed for co-operative trial and, should they prove superior yielders, are grown on a large scale for the sale of seed to farmers. Rotation trials, with one or other of the main crops as the dominant feature, are carried out, and the majority of them include some method of maintaining the fertility of the soil, such as the growing of a leguminous crop for green manure. Different methods of cultivation are also tested.

(iii) *Fertilizers and Manures.*—Manurial trials are extensively conducted at each of the stations under the direction of the chemist. The trials are conducted chiefly on the same land upon which a full rotation of crops is cultivated.

(iv) *Miscellaneous.*—Experiments of a varied character are also carried on in the more specialized branches of agriculture, such as horticulture, viticulture, poultry-farming, tobacco culture, etc.

Co-operative experiments with farmers are now well in progress, and include manurial as well as varietal tests under the varying soil conditions of the different farms. It is sought to bring the results home to the farmers by direct demonstration on the spot.

7. **Laboratory Research.**—In addition to the field trials, many subjects have been investigated in the laboratories. At Cedara the tannin contents of wattle bark, and the extraction of bark, the oxidation of arsenite of soda in cattle dipping tanks, and the sugar contents of different varieties of cane, have been investigated; at Grootfontein, the harmful properties of some of the *storm waters* used for irrigation purposes, the innocuous nature of others, and investigation into soil-alkali problems; at Potchefstroom the methods of combating the ravages of the tubermoth on potatoes, and the theory of sex-control plant-breeding investigations; at Elsenburg the improvement of cereals by selection and hybridizing, wine-making, and a study of the nitrification process in the South-West soils. Soil surveys are being carried out more extensively, and work in this connexion is being co-ordinated by the Chief of the Division of Chemistry, Cape Town.

Arrangements are made at each of the schools for the analysis of soils and agricultural materials, and for the testing of milk and seeds required by farmers.

8. **Scholarships.**—Since the constitution of the Union (May, 1910), 126 scholarships have been awarded to students for special study oversea in agriculture, veterinary science, and the various agricultural sciences, for the purpose of training promising young South Africans to fill posts in the Union Department of Agriculture. The scholarships were of the value of £150 per annum, and have now been increased to £200; the limits of age of candidates are eighteen and twenty-five years; the minimum educational qualification is the Matriculation Examination of the University of the Cape of Good Hope, but candidates are required to have exhausted all facilities for studying their special subject in the Union before proceeding oversea; and on completion of their courses the recipients of these scholarships undertake, if required, to serve the Government for a period of three or more years. Ninety-eight men have already completed their studies, the majority of whom have received appointments in the Department. No new scholarships were granted in 1922–23, as Parliament was unable to vote the necessary funds.

9. **Household Science.**—The principal duties of Household Science officers attached to the Department of Agricultural Education are to give lectures and demonstrations upon cookery and the preservation of home products at gatherings in towns and villages—chiefly in the rural districts—as well as at agricultural shows, where these officers frequently act as judges in the women's section and render valuable assistance to societies in organizing this branch of their activities.

10. **Other Facilities.**—In addition to the instruction provided by the Department of Agriculture, faculties of agriculture are established at Stellenbosch and Pretoria in connexion with the Universities of Stellenbosch and South Africa, and provision is made for courses leading to a degree in agriculture.

11. **Sales of Stock.**—Sales of surplus stock bred on the farms are held annually at each of the schools.

12. **Expenditure and Revenue.**—The following table gives particulars of the expenditure and revenue in connection with Agricultural Education for the financial years 1919-20 to 1923-24:—

AGRICULTURAL EDUCATION, EXPENDITURE AND REVENUE, 1919–20 TO 1923–24.

CHAPTER XIV.

FORESTS.

§ 1. Character and Extent of South African Forests.

1. **General.**—The Union is comparatively a poorly timbered country, and although fairly considerable areas of forest or scrub are known to have disappeared before axe and fire within the last century or two, there appears to be no reason to believe that it was ever, as a whole, a heavily timbered country during the present geological period. There seems to be no ground for supposing that even scrub forests were found on the High Veld or Karoid Veld of the interior, while the same remark applies to a large part of the mountain slopes and the country between the mountains and the sea.

2. **Scrub Forests.**—Roughly speaking the forests of this country may be classed as *dense timber forests* and savannah and *scrub forests*, and the latter form by far the greater proportion. They cover extensive areas known variously as *Thorn veld*, *Bush veld* or *Middel veld*, in addition to the *Low veld* of Natal and the Transvaal. Numerous species enter into their composition, but various kinds of Acacias predominate, and of these the common Mimosa, *Acacia karoo*, is the most widespread. Many of the species yield timbers of good quality, e.g. the wild Olive (*Olea verrucosa*), the Karree-boom (*Rhus lancea* and *viminalis*), the Camelthorn (*Acacia giraffae*), Knoppiesdoorn (*Acacia pallens*), Aapiesdoorn (*Acacia Burkei*), African Teak (*Adina galpini*), and Kajatenhout (*Pterocarpus angolensis*). These trees sometimes reach a moderately large size, sufficient for sawing into timber, but over much of the more accessible areas where they occur, the mature timber has already disappeared. Generally speaking, the trees are of small size and slow growth, and their often scattered distribution and the open nature of the forests do not render such forests suitable for economic forest management. These trees comprise, however, an asset of much value for fuel, fence posts, and other local uses, as well as for shelter for stock and protection against soil erosion. The land on which they are situated has mostly passed into private ownership or is situated within native reserves. Unfortunately, the value of scrub forests is often not realized by the owners, and the destruction of the forests has proceeded ruthlessly in the past, and is still continuing to a large extent. In the category of scrub forests should be included the bushy growth found along much of the coast. A good deal of this has been set apart as Government forest reserves for the prevention of the formation of sand-dunes.

3. **Timber Forests.**—These are found only on the seaward slopes of the mountain ranges within usually less than 100 miles of the coast, and at widely scattered intervals from the Cape Peninsula in the south-west to the Zoutpansberg Mountains in the north-east. Even on the mountain ranges where they occur they seldom occupy any extensive area continuously, but are almost always found in isolated patches of from a few acres to a few thousand acres each, in the *kloofs* or ravines.

(i) *Midland Conservancy, Cape Province.*—The largest of the more or less continuous areas of forest are found within a strip of country some 110 miles long and ten miles broad between the Outeniqua Mountains and the sea, extending from George through Knysna to the Humansdorp Division. It has been estimated that roughly 120,000 acres of this country are occupied by forests. These have been heavily exploited during the last century or more, and the *virgin* timber in them is approaching exhaustion. The principal species composing these forests, and the main uses of their woods are as follows :—

TREES COMPOSING CERTAIN FORESTS AND USES OF WOOD.

Podocarpus Thunbergii.	Real Yellowwood.....	Flooring boards and other building timbers; railway sleepers; joinery and furniture; naves for wagons, etc.
Podocarpus elongata....	Common Yellowwood.	
Curtisia faginea.....	Assegai.....	Wagon-wood (spokes, felloes, etc.).
Ocotea bullata.....	Black Stinkwood or Laurel.	Wagon-wood, furniture.
Olea laurifolia.....	Black Ironwood.....	Wagon-wood.
Apodytes dimidiata....	White Pear.....	Wagon-wood.
Gonioma kamassi.....	Kamassi-wood.....	Exported to Europe for the manufacture of shuttles for weaving, etc.

(ii) *Western Conservancy, Cape Province.*—From George westwards to the Cape Peninsula, scarcely anything remains of the forests which were once found on the mountains, and which were exploited from the earliest days of white settlement in South Africa. They were allowed to be destroyed by fire, and small patches of forests remain only in the more inaccessible kloofs. In the Cedarberg Mountains, north of Cape Town, a distinct type of forest occurs, namely, that of the Clanwilliam Cedar (*Widdringtonia juniperoides*). This species does not form continuous forest, but the trees grow singly or in small groups, scattered on the rocky slopes and crags. The wood is, perhaps, the best of all South African timbers, being a durable light softwood, and the larger trees in all the more accessible parts have long disappeared before the axe. Since the area was made a forest reserve all possible means have been adopted to protect it from fire and to assist regeneration.

(iii) *Eastern Conservancy, Cape Province.*—The timber forests occur chiefly on the Amatola and Pirie mountain ranges, but nowhere do they cover continuous areas of any great extent. These forests have been largely exploited in the past, and few of them still contain any appreciable quantity of virgin timber. In composition they are generally similar to those of Knysna, the most notable differences being that the valuable Stinkwood (*Ocotea bullata*) occurs only rarely in the forests of the Eastern Province, while on the other hand they contain much Sneezewood (*Ptaeroxylon utile*), the wood of which is one of the most durable timbers known, and is of great value for fence posts.

Kamassi wood is of rare occurrence, but the true Cape Box (*Buxus Macowani*), yielding a valuable wood not much inferior to the European boxwood, is found in fair abundance in the Alexandria and East London Divisions, forming, with Sneezewood and some other species, a type of low but dense forest in the neighbourhood of the coast.

(iv) *Transkeian Territories.*—The timber forests here are, in general, similar in distribution and composition to those of the Eastern Province, but somewhat extensive forests occur at intervals along the coast. The species constituting these are very varied, and include, in addition to the species of the Eastern Province, many others of more northern range, such as Cape Mahogany (*Trichilia emetica*), Umzimbiti (*Millettia caffra*), Umgesisa (*Cussonia umbellifera*), and Flatcrown (*Albizzia fastigiata*). Considerable quantities of Cape Box (*Buxus Macowani*) also exist in these forests.

Some of the more accessible of the Transkeian forests have been heavily worked in the past, but many of them, including most of the coast forests and some fine forests of nearly pure Yellowwood (*Podocarpus falcata*) in the northern part of the Territories, have been too inaccessible to allow of profitable utilization.

(v) *Natal.*—The forests of Natal are now of small extent, the greater proportion of those which once existed having passed out of Government ownership or been included in native locations, and much of the area once occupied by them has been deforested. Generally speaking, they may be grouped as mountain and coast forests like the Transkeian forests, and are of more or less similar composition. A special feature of some of the coast forests is the large proportion of Waterwood (*Syzygium cordatum*), a comparatively light, easily worked wood. Some of the Crown forests have been heavily worked in the past, but there are some well-stocked forests of virgin timber, largely Yellowwood, still existent on the reserves in the southern districts of Natal.

(vi) *Transvaal.*—The timber forests occur at widely scattered intervals on the mountain ranges along the eastern edge of the plateau from the Natal border northwards, and are of small extent, with the exception of some comparatively large and continuous areas on the easterly slopes of the Woodbush Mountains and, to a less extent, on the outlying Zoutpansberg Range, in the extreme north. With the exception of a few thousand acres of still virgin forest in parts of these ranges, the forests have all been heavily worked in the past and little merchantable timber remains.

4. **Extent of Plantations and Indigenous Forests.**—The area of all plantations and indigenous forests in the Union (including Government plantations and forests), as returned at the Agricultural Census of 1921, is shown in the following table, which gives the area under different species in the plantations in each Province :—

PLANTATIONS AND INDIGENOUS FORESTS (INCLUDING GOVERNMENT PLANTATIONS AND FORESTS)—AREA AT 30th APRIL, 1921.

Province.	Plantations.						Indigenous Forests.	
	Gums.	Conifers.	Poplars.	Wattles.	Other Species.	Total.	Dense or True Forest.	Scrub or Dwarf Forest.
	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.
Cape of Good Hope....	24,742	38,757	7,329	15,110	27,783	113,721	521,336	2,368,255
Natal.....	14,197	3,524	902	222,778	6,625	248,026	147,200	128,192
Transvaal.....	60,272	10,587	4,707	49,289	14,803	139,658	107,652	4,064,910
Orange Free State.....	28,099	8,667	6,976	1,249	12,335	57,326	1,429	152,528
TOTAL.....	127,310	61,535	19,914	288,426	61,546	558,731	777,617	6,713,885

5. **Regeneration and Growth of the Timber Forests.**—In many of the forests, particularly in those of the Eastern Province, natural regeneration is very deficient, but in others, as in those of Knysna and some of the Transkeian forests, it is more abundant. In the majority of the forests, when in virgin state, the proportion of trees of pole size was low, and when exploitation of the forests occurred in the past little or no heed was given to the preservation of the young trees or to securing conditions favourable for natural reproduction. Often over-mature and rotten trees were the only trees left, and even since the Forest Department has taken charge of the forests, it has often been necessary to leave such trees owing to the fact that they were unmerchantable, and to there being an insufficient number of immature trees left to preserve the forest canopy. Moreover, the young growth in many of the forests was continuously destroyed by natives for the sake of hut-wattles, and grazing and fires have contributed to its destruction. Almost all the species of trees are of slow growth. For all these reasons it will be seen that many of the forests are necessarily not in a normal condition, and that, although it is not intended to allow the young growth to reach the dimensions or ages of the virgin timber, a considerable period of time must, as a general rule, elapse before much mature timber from them will again be available.

6. **Reserved Indigenous Trees.**—In terms of regulations framed under the *Forest Act*, No. 16 of 1913, the trees named in the following list are reserved indigenous trees within the several Provinces of the Union :—

LIST OF RESERVED INDIGENOUS TREES.

Botanical Name.	English Name.	Dutch Name.
Acacia albida, Delile.....	—	—
Acacia giraffae, Burch.....	Camel Thorn.....	Kameeldoring.
Acacia pallens (Benth), Rolfe.....	Knobthorn.....	Knoppiesdoring.
Adina Galpini, Oliver.....	African Teak.....	Mingerhout.
Afzelia quanzensis, Welv.....	Rhodesian Mahogany....	—
Albizzia fastigiata, Oliv.....	Flat Crown.....	—
Apodytes dimidiata, E. Mey.....	White Pear.....	Wit Peer.
Bolusanthus speciosus (Bolus), Harms.....	Elephant's Wood.....	Van Wijkhout.
*Brachylena dentata, Less.....	Malbar.....	Malbar.
*††Brachylena discolor, D.C.....	Forest Vaalbosch.....	Vaalbos.
Bridelia micrantha, Baill.....	—	—
Buxus Macowani, Oliv.....	Cape Box.....	Buig my nie.
Callitris arborea, Schroder.....	Clanwilliam Cedar.....	Seder.
Calodendron capense, Thunb.....	Wild Chestnut.....	Kastanjehout.
*†Celastrus acuminatus, L.....	Silkbark.....	Sybas.
†Celastrus peduncularis, Sonder.....	Zwarthout.....	Swarthout.
Celtis rhamnifolia, Presl.....	Camdeboo Stinkwood....	Wit Stinkhout, Kamdeboo Stinkhout, Witgathoom.
Chrysophyllum viridifolium.....	—	—
Combretum Kraussii, Hochst.....	Bush Willow.....	Rooiblad.

* Not reserved in the Eastern Conservancy. † Not reserved in the Transkeian Conservancy.
‡ Not reserved in the Natal Conservancy.

LIST OF RESERVED INDIGENOUS TREES—*continued.*

Botanical Name.	English Name.	Dutch Name.
Combretum porphyrolepis, Engl. and Diels.	Leadwood	Loodhout.
Croton sp. (Sim 2485)	—	—
Cryptocarya sp.	—	—
Cunonia capensis, L.	Red Alder	Rooi Els.
Curtisia faginea, Ait.	Assegai Wood	Assegaihout.
Cussonia umbellifera, Sond.	Coast Cabbage Wood	—
Cyclostamen argutus, Mall.	—	—
Diospyros mespiliformis, Hochst.	Hill Matomi	Jakhalsbessie.
Ekebergia capensis, Sparm.	Dog Plum, Cape Ash	Essehout.
Ekebergia Meyeri, Presl.	—	Essehout.
Elaeodendron croceum, D.C.	Saffron Wood	Saffraanhout.
Elaeodendron sphaerophyllum, Presl.	Cape Cherry	Koedoebessie.
‡§Erythrina caffra, Thun.	—	Kafferboom.
Eugenia Gerrardi, Harv.	—	—
†Eugenia Zeyheri, Harv.	White Underbush	—
†Excoecaria africana, Mull.	—	—
†Excoecaria caffra	—	—
Faurea saligna, Harv.	Cape Sandal	Beukenhout.
Faurea sp.	Boekenhout	Beukenhout (Pondoland).
Garcinia Gerrardi, Harv.	—	—
Gardenia Rothmannia, L.	Ebony	Wilde Katjepiering.
Genioma kamassi, E. Mey.	Wild Gardenia	Kamassi.
Harpephyllum caffrum, Bernh.	Kamassi	Kafferpruim, Suurbessie.
Heywoodia lucens, Sim.	Kaffir Plum	—
†Homalium rufescens, Benth.	Cape Ebony	—
†Ilex capensis, Sond. and Harv.	—	Without, Waterhout.
Kiggelaria africana, L.	Water Tree	Spekhout, Wilde Perske.
†Kiggelaria Dregeana, Turcz.	Wild Peach	Spekhout, Wilde Perske.
*Lachnostylis capensis, Turcz.	Wild Peach	Koolhout.
Leucadendron argenteum, R. Br.	Coalwood	Witboom.
Millettia caffra, Meisn.	Silver Tree	Kaffer Ysterhout, Umzimbiti.
Mimusops obovata, Sond.	Kaffir Ironwood, Umzimbiti	Rooi Melkhout.
Myrsine melanophleos, R. Br.	Red Milkwood	Beukenhout.
†Nuxia floribunda, Benth.	Cape Beech	Vlier.
Ochna arborea, Burch.	Wild Alder	Roothout.
†Ochna sp.	Cape Plane	Roothout.
Ocotea bullata, E. Mey.	Plane	Stinkhout.
Olea foveolata, E. Mey.	Black Stinkwood	Ysterhout.
Olea laurifolia, Lamk.	Bastard Ironwood	Regte Swart Ysterhout.
Olea verrucosa, Link.	Black Ironwood	Olyvenhout.
Olinia cymosa, Thunb.	Wild Olive	Rooibessie, Rooihout.
Phyllanthus amapondensis	Mountain Hard Pear, Red Berry	—
Platylophus trifoliatus, Don	Engossa Red Pear	Wit Els.
†Plectronia Mundtiana, Pappe	White Elder	Klip Esse.
Plectronia obovata	Rock Alder	Quar.
Pleurostylia capensis, Oliv.	Quar	Harde Peer.
Podocarpus elongata, L'Herit.	Coffee Pear	Geelhout.
Podocarpus Thunbergii, Hooker	Outeniqua or Bastard Yellowwood	Opregte Geelhout.
Ptaeroxylon utile	Real or Upright Yellowwood	Nieshout.
Pterocarpus angolensis, D.C.	Sneezewood	Kajat.
Pterocelastrus variabilis, Meisn.	—	Kersehout.
Pygeum africanum, Hook.	Candlewood	Bitter Amandel, Rooi Stinkhout.
Rhamnus Zeyheri, Sond.	Bitter Almond, Red Stinkwood	Rooi Ivoor.

§ 2. Forestry Development.

1. **Relation of the State to Forestry.**—Until 1876 no central or technical control was exercised over the Crown forests of the Cape Colony, but in that year a Department of Forests and Plantations was constituted, and in 1881 a Superintendent of Woods and Forests was appointed. In 1891 this post was abolished, and the four Conservancies into which the Colony had been divided were thereafter administered independently by four Conservators, until in 1905 a Chief Conservator of Forests was again appointed. In the Transvaal and the Orange Free State the Crown Colony Governments, about the year 1903, established Forest Departments as sub-divisions of the respective Agricultural Departments. In Natal no settled policy was followed, but the post of Conservator of Forests was twice made and abolished, the administration of the forests being in the hands of the Director of Agriculture from 1908 onwards. When the Union was established in 1910 the four Departments were immediately combined under one Chief Conservator of Forests, and uniformity of administration has since been maintained. In 1913 a *Forest Act* for the Union was passed (Act No. 16 of 1913). This Act, which came into force on the 1st November, 1913, consolidates and amends the forest laws previously in force in the various Provinces of the Union; and relates to forest tenure, forest reservation, demarcation, and the regulation and protection of forests. With certain modifications it follows the principles laid down by the Cape *Forest Acts*, No. 28 of 1888 and No. 20 of 1902. *The Forest (Demarcation) Act*, No. 14 of 1917, makes further provision as to the demarcation of forests and forest reserves. A number of Proclamations and Government Notices have been issued dealing with a variety of matters such as felling season, prospecting on forest reserves, reserved trees, tariff for collection of buchu, undemarcated forests, etc.

In terms of the Union Act forest reserves consist of both demarcated and undemarcated reserves. The penalties imposed in respect of offences within the demarcated forests are, as a rule, severer than those levied in the case of offences in undemarcated forests. The Act confers upon the Government the power of expropriation of land for certain forestal purposes and provides that no servitudes can now be acquired by prescription over the forest estate. Certain portions of the Act deal specifically with the protection of private forests, but, in addition, any owner of a private forest may have any or all of the provisions of the Act applied to his forests for their better protection. All trees growing on the side of any road and not being on private property are, in terms of the Act, subject to the control of the Forest Department, provided they are not within the limits controlled by a municipality or other similar public body.

On the 31st March, 1924, the forest reserve areas comprised 2,042,666 acres demarcated, and 593,443 acres undemarcated, representing a total of 2,636,109 acres.

Demarcation is still proceeding, especially in the Transkeian Territories, where a considerable area of timber forest remains to be dealt with.

2. **Policy of the Forest Department.**—The policy of the Forest Department may be briefly stated to be as follows:—

(*a*) To protect and conserve the indigenous timber forests and to utilize their products in such a manner as not to impair but rather to increase their future productivity. Funds are voted annually by Parliament for this purpose, and are mainly spent on protection from fire, and on artificial reproduction where natural regeneration is lacking. The destruction of young growth by natives for hut-wattles has been almost entirely stopped as a result of the establishment of plantations of exotic species to supply this product. The cash revenue derived from the indigenous forests during the financial year 1923–24 was £29,087. In addition many thousands of pounds' worth of forest produce (chiefly firewood and hut-wattles) were removed free of charge.

(*b*) To increase the production of timber in the country by the formation and proper management of plantations of exotic trees, numerous species, yielding either the ordinary softwoods of commerce or durable softwoods of the cedar and cypress classes, or durable hardwoods such as some of the eucalypts, are principally employed, the selection of species varying in different parts of the country according to the climate and soil.

The afforested area of the Government plantations on the 31st March, 1924, was 110,072 acres. The cash revenue derived from the plantations during the financial year 1923–24 was £63,461. These figures include those for the railway sleeper plantations, the management of which is undertaken by the Forest Department, and also include revenue derived from sales of transplants and seeds to the public.

A good deal of the vacant ground included in the forest reserves is suitable for afforestation, with which steady progress is being made.

The earlier plantations are beginning to yield considerable returns from thinnings, but mature timber will not be ready for cutting for some years, except on small areas.

The Department also undertakes the reclamation of drift-sands on the coast, where required, in addition to protecting the natural vegetation, with a view to preventing the formation of new drift-sands.

(c) To encourage the general afforestation of the country by inducing farmers and others to plant trees for purposes of shelter, to provide wood for fuel, and for other local uses. With this object the Forest Department disposes of forest trees and seeds at very low prices, and it is always ready to give advice as to the selection of species, methods of cultivation, and the like. Its officers also give lectures at some of the Agricultural Schools.

During the financial year 1923–24, 4,228,970 transplants were sold and otherwise disposed of from the Government nurseries, a considerable number being issued gratis to Government institutions. By far the greater proportion of these trees was planted in the Transvaal and the Orange Free State, on the treeless high veld.

While only a few private plantations of any extent have been established with the object of producing mature saw timber, fairly large areas have been planted by companies or private individuals with the object of producing mine-props.

The most extensive private plantations, however, are those of black wattle for the production of tan-bark, and the area of these in Natal, where the industry is centred, is estimated to be approximately 220,000 acres, the total area for the Union being probably about 288,000 acres.

3. **Organization of the Forest Department.**—The Department is controlled by the Chief Conservator of Forests, who is also the Accounting Officer, and it is a sub-department of the Department of State controlled by the Minister of Agriculture.

The Department is divided into six Conservancies, which in turn are divided into districts. These are as follows :—

CAPE PROVINCE, WESTERN CONSERVANCY.—Conservator of Forests, Cape Town. District Forest Officers, Tokai, Kluitjes Kraal, Elgin.

CAPE PROVINCE, MIDLAND CONSERVANCY.—Conservator of Forests, Knysna. District Forest Officers, George, Knysna, Storms River, Concordia.

CAPE PROVINCE, EASTERN CONSERVANCY.—Conservator of Forests, King William's Town. District Forest Officers, King William's Town, Port Elizabeth, Stutterheim, Keiskama Hoek.

CAPE PROVINCE, TRANSKEIAN CONSERVANCY.—Conservator of Forests, Umtata. District Forest Officers, Butterworth, Kokstad, Umtata, Mount Frere.

TRANSVAAL AND ORANGE FREE STATE CONSERVANCY.—Conservator of Forests, Pretoria. District Forest Officers, Doornboom, Pretoria, Bloemfontein.

NATAL CONSERVANCY.—Conservator of Forests, Pietermaritzburg. District Forest Officers, Eshowe, Weza, Cedara.

The number of District Forest Officers, including Assistant District Forest Officers, is forty. Each district usually comprises several forest stations, which are in charge of Foresters, of whom there are one hundred and forty-five.

FOREST SCHOOL.—A lower-grade forest school is conducted at Tokai, Cape Province, for the training of Foresters, the course occupying nine months after an apprenticeship period of one year.

RESEARCH BRANCH.—This is attached to the office of the Chief Conservator of Forests, Pretoria, and undertakes research and the collection of data relating to all branches of forestry, especially sylviculture and the utilization of forest products. It includes charge of herbarium and museum. Investigations into the seasoning of wood in modern kilns and the preservative treatment of timber are now being carried out. A sylvicultural research station is established at Deepwalls, near Knysna. Altogether, eight professional officers are employed in this Branch.

RECRUITMENT OF OFFICERS.—Officers of the higher grade are recruited from graduates of South African Universities who subsequently complete a course in forestry at an approved British or American University.

4. **Revenue and Expenditure of Forest Department.**—The subjoined tables give particulars of expenditure and revenue of the Union Forest Department in the financial years 1922–23 and 1923–24, distinguishing railway sleeper plantations from ordinary forestry operations :—

* Probably this is chiefly Yellow Poplar or Tulip and not true Poplar (Populus).
† Included with other timber.

In addition, manufactured wood to the value of £1,043,220 and £1,151,022 was imported in 1923 and 1924, making a total value of £2,849,306 and £2,884,111 respectively.

The exports of South African woods during 1923 and 1924 were of a value of £10,920 and £7,102 respectively.

2. **Yield from South African Forests, etc.**—The yield from the Government forest reserves and plantations during the financial years 1919–20 to 1923–24 was as follows :—

GOVERNMENT FOREST RESERVES AND PLANTATIONS—YIELD OF TIMBER, 1919–20 TO 1923–24.

Description.	1919–20.	1920–21.	1921–22.	1922–23.	1923–24.

From Railway Sleeper Plantations—					
Timber*	70,958	77,261	64,482	84,229	122,637
Firewood	112,968	201,928	245,530	365,903	432,786
Hut-wattles, fencing droppers, etc.	45,734	67,282	55,313	53,934	76,711
TOTAL	5,606,205	5,847,667	5,417,562	5,039,669	6,106,826

* Includes mine-props, fencing poles, etc.

Of wood produced other than on the forest reserves, a large quantity is cut annually in the wattle plantations, and though a good deal of it is wasted owing to inaccessibility, much of it is used for fuel, mine-props, etc., and a small part of it is converted into boxwood. Private plantations yield a large proportion of the props used in the gold and other mines. Considerable quantities of wood from the scrub forests on private property are used for fuel, charcoal, fence posts, and other local requirements. A small amount of wood in both scrub and timber forests on private ground is converted into sawn timber.

A large proportion of the sawn wood produced in the Union is used for wagonwood and furniture for which purposes many of the South African woods are particularly suitable. Yellowwood is used for railway sleepers as well as for general construction timbers. Smaller proportions of the total are converted into such articles as boxes and tool-handles.

The following table gives the production from all plantations and indigenous forests in the Union, as returned at the Agricultural Census of 1921, in respect of the year ended 30th April, 1921 :—

* E.g. Saw timber, Railway and Harbour works, buildings, match factories, etc.
† E.g. Fencing posts, fencing droppers, building spars, etc.

3. **Minor Forest Industries.**—(i) *Wattle Bark.*—This is by far the most important of the minor forest industries of the Union. It is a well-established one, and promises to have a future of continued expansion and prosperity. It has been developed by private enterprise, notably in Natal, where, as already mentioned, the greater proportion of the approximate total of 288,000 acres of private wattle plantations is situated. The area of wattle on the Government plantations is insignificant by comparison, the areas which exist consisting for the most part only of belts established for the purpose of fire protection.

The following table gives the production of wattle bark from all plantations in the Union, as shown in the Agricultural Census of 1921 :—

PRODUCTION OF WATTLE BARK IN THE UNION, YEAR ENDED 30th APRIL, 1921.

Heading.	Cape.	Natal.	Transvaal.	Orange Free State.	Union.
Area clear cut Acres.	436	17,450	1,463	—	19,349
Yield.....lb..	1,729,700	106,361,600	8,484,400	—	116,575,700

The exports of (*a*) wattle bark and (*b*) bark extract from the Union during a series of years were as follows :—

The main market for the bark is Germany, but during the War the United Kingdom occupied the leading position in this respect. The leather manufacturers in Great Britain, have, however, for the most part, required their tanning material in the form of extract. Efforts have been made to secure a greater market for the bark in Great Britain, and factories for the production of the extract have been established in South Africa.

(ii) *Buchu.*—This product, which is used for medicinal purposes, consists of the dried leaves of two or three species of *Barosma*, shrubs which grow on the mountains of several of the south-western districts of the Cape Province. The most valuable kind is *Barosma betulina*, which grows principally in the Cedarberg Mountains, but also in the Tulbagh, Ceres, and Piquetberg Divisions. There is a considerable demand for this product in Europe and America, and large quantities are exported annually. The export in 1924 was 152,657 lb, value of £17,965, or 2s. 4d. per lb.

The greater part of the output is obtained from privately owned lands.

During 1923–24 the revenue derived from buchu collected on the forest reserves was £4,454.

(iii) *Berry Wax.*—This is obtained from the berries of *Myrica cordifolia*, a shrub growing on the coast sands in the neighbourhood of Cape Town. It is used locally for floor polish, etc., and is also suitable for soap manufacture.

CHAPTER XV.

FISHERIES.

§ 1. The Fishing Industry of the Cape of Good Hope.*

1. **History of the Industry.**—The fishing industry is one which has to a large extent been neglected, and the earliest settlers in this country found little encouragement in developing it. Van Riebeek, the first Governor, issued peremptory instructions that they were not to "waste their time in fishing," and this continued to be the spirit in which the calling was viewed until comparatively recent times. Some of the freed slaves were, however, allowed to engage in fishing. These were chiefly Malays, who to this day constitute the chief fishing population. Long after the time of Van Riebeek, obstacles were placed in the way of the development of the fishing industry, and only 150 years ago Colonists were forbidden to establish fishing stations at any distance from Cape Town, as this necessitated protection from headquarters. Fishing was, indeed, allowed at Saldanha Bay, but, as a 15 per cent. royalty was demanded on the proceeds, no one cared to take advantage of the permission. The native fishermen pursued their calling with the aid of small open boats, which they carried up on to the beach out of the reach of the waves on each return from the fishing grounds, a habit which they have preserved up to the present, when the necessity for it has ceased, as for instance in Table Bay, where it is now quite safe to anchor the boats. They fish almost exclusively by hook and hand line, and, to a limited extent, by seine nets in certain localities. Drift and trammel nets are unknown, and set nets are not much used. There is no long line fishing. Until comparatively recently it was often easy to glut the limited market with fish, and to prevent such an undesirable state of affairs the fishermen regulated the quantities of fish caught, and little was to be feared from any disturbance of their monopoly.

2. **Later Development.**—Within the last thirty or forty years, owing partly to the increased white population and the consequent demand for fish, attention has been directed to the possibilities of developing the fisheries. Modern methods of fishing, such as long line fishing and trawling, were attempted by private enterprise, but did not prove successful. The use of the long line was rendered difficult on account of the large number of dog-fish which infest South African waters. Trawling was tried in Table Bay and elsewhere. At Port Elizabeth it was taken up by the steam tugs in their spare time, and an area in Algoa Bay, of somewhat limited extent, was regularly visited, and afforded a small supply of soles. In the year 1895 the attention of the Government of the Cape Colony was drawn to the undeveloped state of the fisheries, and the need for some action to be taken in the matter. An officer was appointed for the purpose of obtaining definite and reliable information as to the resources of the South African seas, and to advise as to what steps should be taken to place the industry on a more satisfactory basis, both with regard to its development and to its conservation. A steam trawler, the *Pieter Faure*, specially designed for experimental work, was built, and a systematic investigation commenced. This investigation was initiated and carried out under the Department of Agriculture, of which the late Sir Pieter Faure was then Secretary. Details of the work are embodied in reports of Government biological and marine investigations in South Africa, published by the Government of the Cape of Good Hope. Briefly stated it was found that, while long line fishing and net fishing generally were not impracticable, yet the most promising line of development was that of trawling. Though the West Coast proved unsuitable, some very large hauls of the trawl were made in False Bay, and, on proceeding to the large area of the Agulhas Bank, certain extensive pieces of ground were, after careful survey, found not only to be suitable for trawling, but to afford phenomenal quantities of soles. The trawling area in False Bay proved to be limited and somewhat patchy, and, although two small vessels, owned by private firms, soon afterwards began working the ground surveyed, no very important progress was made. The soles were limited as to numbers, small, and of inferior quality. On the other hand, the area found further afield (first at Mossel Bay), though

* Contributed by J. D. F. Gilchrist, M.A., Ph.D., D.Sc., Marine Biologist, Cape Province.

admirably adapted for trawling, and with an abundant supply of valuable soles, was so far removed from the market that some difficulty was experienced in opening it up. Further survey showed that other areas, both on the Agulhas Bank and on the East Coast near Bird Islands, were excellent trawling grounds, and several large modern trawlers are now landing fish from these areas, so that the fish supply has been recently about doubled. The fisheries survey was resumed in 1920, a trawler, s.s. *Pickle*, being utilized for the purpose, and valuable results have accrued from the more recent investigations. In 1911 (according to Census returns), the catch of fish by Cape fishermen was about 116,000 cwt., while in 1913 (according to Customs returns) the catch of fish by Cape trawlers represented 125,000 cwt. Subsequent figures are given in paragraph 7 below.

3. **Cape Fishing Pursuits.**—The development of Cape fisheries has not been along the lines customary to such enterprises. Owing to the lack of harbours in which large boats can find shelter, and to some extent to the apathy and conservatism of the native fishermen, there has been no transition stage from the utilization of small open rowing boats to that of large modern steam vessels, and there are no large-decked sailing boats which find shelter in small fishing harbours. The construction of small fishing harbours is the next desideratum in the progress of the fishing industry to allow of the use of the decked sailing boats so characteristic of the fishing industry of Europe. Initial steps have already been taken in this direction, and the accomplishment of the desired object would probably mean the rise of a new and enterprising race of fishermen, and probably the improvement of certain branches of fishing at present neglected. The fishing industry and its possible development cannot, however, be exactly on the same lines as in Europe, the fish themselves being in some degree different in kind and habit; but there is enough similarity to justify the conclusions—already partly proved—that there is a great opening for improved methods in the catching, curing, and distribution of fish on modern lines.

4. **Fish Varieties.**—The following brief review of the Cape fish and fisheries gives a concrete idea of the industry and its possibilities :—

(*a*) *Snoek.*—The *Snoek* (the *Barracouta* of Australia) was about twenty years ago one of the most abundant of Cape fish. At that time it was caught in enormous numbers during the season, and was exported to Mauritius. It is a fish peculiar to the southern hemisphere, occurring in the waters round Chili, Tristan da Cunha, the south-west of the Cape, and the south-west of Australia. Of recent years it has, to a large extent, disappeared, and with it one of the most characteristic features of the Cape fisheries. It may be that this fish is to be found in other localities too distant to be visited by small open boats.

(*b*) *Silverfish, Hottentots, Pangas, Red Stumpnose, etc.*—These fish are more or less stationary in their habits, and are the staple fish of the fishing industry. They are caught by hand lines, and are usually fairly abundant, though of late years the fishermen complain of scarcity. This they attribute, among other things, to the destruction of the fry and eggs by the trawl. This question and the kindred one of the destruction of immature fish was investigated by the Cape Government by means of the prospecting steamer and a small marine laboratory. It was shown that the allegations were without foundation, and the new industry was saved from the untimely end which was the fate of a previous venture, referred to below. It has been demonstrated on a small scale that some of these fish are well adapted to the process of smoking, and they would undoubtedly compete satisfactorily with the great quantities of imported smoked fish with which the South African market is supplied.

(*c*) *Geelbek, Kabeljauw,* and *Stockfish.*—These are among the most important of the large migratory fish. The *Geelbek* (often known as the *Cape Salmon*) is a large handsome fish with a superficial resemblance to the salmon, but with no real affinity to the *Salmonidae.* It is not often caught in the trawl, but is frequently taken in large quantities by hook and line. The *Kabeljauw* and the *Stockfish* are said to be identical with the *Maigre* and the *Hake* of European seas. They are caught both by line fishing and by trawl, by the first-named sometimes in great quantities. With these larger migratory fish is included the brilliantly coloured *Seventy-four,* more abundant in the warmer waters of the East Coast, where it is known as the *Silverfish,* the *Silverfish* of the West Coast being known as *Carpenters.* With modern methods of fishing and with larger boats, which would enable the line fishermen to proceed further out to sea, these large and valuable fish could doubtless be procured in greater quantities.

(*d*) *Smaller Migratory Fish.*—Among the smaller migratory fish are the *Mackerel,* the *Harder,* the *Herring,* and the *Anchovy.* The *Mackerel* is very little different from the European species, and occurs abundantly at certain seasons. It is not, however, looked upon with favour by the fishing community, and is even regarded as poisonous, and indeed it may have proved so when preserved by

some of the rough-and-ready methods once in vogue. An enterprising American some years ago visited the Cape with a schooner and brought nets for the express purpose of procuring a fish which is appreciated at its true value in America. Great quantities were procured, but the native fishermen made such strong representations as to the damage caused, especially to the *spawn* of fish, that in the absence of better information, the Legislature was induced to pass a law forbidding the use of such nets. Of the smaller migratory fish, neither the *Herring* nor *Sardine*, nor the *Anchovy*, is put on the South African market, which is flooded with tinned sardines, smoked herring and haddocks, and other European fish.

(*e*) *Flat Fish.*—The investigations of the Government have shown that a sole, equal in value to the European sole, occurs in great abundance on the Agulhas Bank. South Africa is now better supplied with this fish than Britain, and its exportation in ice to Europe may be quite a feasible enterprise.

(*f*) *Crawfish.*—A species of crawfish occurs very abundantly in the colder waters of the West Coast, from Cape Point northwards. For many years, owing to defective canning and other causes, the crawfish industry made little or no progress, but recently great advances have been made, and at the present time a very extensive export trade is being carried on. Thus in 1920 there were fifteen factories engaged in this industry, each dealing on an average with more than a million crawfish. In 1922 there were ten canning companies in operation, and the number of crawfish caught was 14,801,546.

(*g*) *Oysters.*—The *Rock oyster* was formerly very abundant; a fair supply is yet obtained from some places, and for these good prices are secured. The supply has, however, become very limited, yet there is every prospect that with artificial propagation and adequate care a valuable industry may be established. The *English Oyster* might be cultivated in some of the more sheltered bays, such as Saldanha Bay, Knysna, and Zwartkops. Experiments have actually been made in this direction, but, although the oyster thrives well, no sustained and systematic oyster culture has been attempted.

5. **Whales.**—Of recent years great improvements in the method of capturing whales and in their subsequent treatment have been effected; and various species, formerly of little value, now comprise the basis of important industries in various parts of the world. In South Africa the revival of this old industry has been rapid. The value of whale oil exported from South Africa in 1910–14 (average) was £106,989, and in 1924, £264,742.

6. **River and Enclosed Water Fisheries.**—The rivers of the Cape Province were remarkable for the poverty of their fish fauna. The *Kurper*, or native carp, is a small fish; the *Wit-visch*, a kind of barbel, is of little value from a sporting or economic point of view; and the same is to be said of the *Moggel* or mud-fish. Trout, carp, and other fish have been introduced from oversea, and have proved a success. Trout are now established in many rivers in the Cape, Natal, and Transvaal Provinces, and in Rhodesia. The introduced carp thrive remarkably well in the numerous dams and enclosed waters in the country; and there is a continuous and growing demand for the ova and fry of trout and carp which are reared at the Government hatcheries.

7. **Statistics.**—The following tables (i) and (ii) give figures relating to the whaling and fisheries industries of the Cape of Good Hope:—

‡ Represents catch at the stations mentioned in the preceding note and at Somerset Strand.

§ 2. The Fishing Industry of Natal.

1. **Early Legislation.**—As early as the year 1867 the fisheries of Natal were made the subject of legislation, a law being promulgated in that year to regulate the capture of fish within the bay or harbour of Natal. An amended Law (No. 13 of 1880) made extended provision for the same purpose and over the same area. By this law licences for the capture of fish by fish kraals and certain specified nets were obtainable on payment of an annual licence fee of £1. Contraventions of the enactment were punishable by fine, or in certain cases by imprisonment for a period not exceeding one month. Half the amount of fines recovered was payable to informers. In 1881 the Government of Natal appointed a commission to inquire into the subject of the pollution of streams in the coast districts of Natal. This Commission, while not directly connected with the fishing industry, put forward valuable recommendations affecting the interests of the Natal fisheries.

2. **Later Legislative Provision.**—In 1883 the Natal Fisheries Industry Commission recommended the framing of an amended and more comprehensive law, with the result that in the ensuing year the *Fisheries Law* (No. 21 of 1884) was passed with jurisdiction extending to all waters of the Colony of Natal in which fish were found. The control of the waters of the bay of Port Natal, of the ocean beach to Umgeni, and over the tidal waters of the rivers Umgeni, Umbilo, and Umhlatuzana, was vested in the Natal Harbour Board, and of all other districts in the magistracy of the Division. This law contained provisions and penalties similar to those previously in existence, and also fixed close seasons. Provision was further made for the taking and culture of oysters, whilst the pollution of fishing areas was also dealt with. Laws No. 18 of 1887, No. 27 of 1890, and No. 17 of 1901, extended the provisions of the law referred to, and further regulated and protected salmon and trout fisheries. In 1903 a change in the administration of these enactments was brought about by the appointment of a fisheries inspector, and the gradual absorption of the administrative work in so far as coastal fisheries were concerned, in one office, under the direction of the secretary to the Natal Harbour Department. As a result of the experience thus gained, the *Coast Fisheries Act* (No. 31 of 1906), operative from the 1st January, 1907, was promulgated repealing all existing statutes relating to coast or sea fisheries, the inland or fresh-water fisheries being governed as previously. From that date the Natal Fisheries Department became more fully organized. An extended scheme of licensing was instituted. The fees ranged from 10s. to £10 per annum, according to the nature of the licences issued, and the penalties for contraventions of the law were increased. The Act of 1906 was amended and added to by the Natal Provincial Council in Ordinances No. 12 of 1912, No. 2 of 1913, and No. 4 of 1914, dealing principally with the whaling industry and the question of pollution. In view of the larger experience gained, the greater interest displayed in the potential value of the local fisheries, and the more extended operations of those concerned, the opportunity was taken in 1916 of re-codifying the governing enactments by the passage through the Natal Provincial Council of the *Natal Fisheries Ordinance,*

No. 11 of 1916, a measure which provides for the conservation, control, protection, and regulation of the fisheries of Natal. This Ordinance embraced the coastal and inland fisheries and virtually repealed all previous enactments; and it is anticipated that the measure will prove of considerable value. The Ordinance became operative on the 1st July, 1916, but only of practical effect from the 1st January, 1917, with the promulgation of a code of regulations. The Ordinance and Regulations were drafted by the Natal Fisheries Advisory Board and the Natal Fisheries Board respectively. Provision is made for a comprehensive system of licensing and for effective supervision, while substantial penalties are enforceable for offences. In its terms the Ordinance provides for effective supervision under the Natal Fisheries Department, and for the constitution of the Natal Fisheries Board, while prospective work in the direction of scientific inquiry and development are amply provided for when the Administration is able to undertake or direct such action in the interests of the industry.

Regulations governing the licensing and control of the Inland Fisheries were promulgated and became operative on the 1st September, 1919.

3. **Natal Fisheries Department.**—The establishment of the Natal Fisheries Department at the end of 1922 consisted of (*a*) the Natal Fisheries Board of nine members, with the Principal Fisheries Officer as secretary; (*b*) the officials of the Department; (*c*) forty-five persons acting as honorary fisheries inspectors in the various districts of the Province; and (*d*) the Curator, Provincial Trout Hatchery at Estcourt.

4. **Commissions and Boards.**—In 1901 certain investigations on Natal Fisheries were conducted under the direction of Dr. J. D. F. Gilchrist, Government Biologist of the Cape of Good Hope, during a limited period of the year and over a limited area. The results of these investigations will, it is proposed, be followed by extended inquiries leading to a more established industry, the potentialities of which are now being fully realized. The recommendations of Government Inquiry Commissions in 1911 and 1914 were followed in December of the latter year by the appointment of the Natal Fisheries Advisory Board; and this body was succeeded on the 1st July, 1916, by the Natal Fisheries Board constituted under the Ordinance of that year. As a result of representations made in the Provincial Council, another Commission was, in December, 1920, appointed by the Administrator to investigate and report on matters affecting the fishing industry in the Province, and a report by this body was issued on the 22nd April, 1921, the recommendations contained therein receiving the attention of the Administration. One of the recommendations, which has been adopted, was to the effect that the Board be strengthened by the appointment of two additional members, one representing the European industry and the other the Indian fishermen, the latter representative to be a European. The Board is composed of nine members.

5. **Fish Varieties.**—The following list includes the more important edible species of fish obtained on the Natal coasts:—

FISH FOUND IN NATAL WATERS.

Local Name.	*Scientific Name.*	*Local Name.*	*Scientific Name.*
Barracuda	Cybium commersoni.	Pampano	Trachynotus ovatus.
Blackfish	Dinoperca queketti.	Parrotfish	Julis umbrostigma.
Blacktail	Sargus rondeletti.	Prodigal Son	Elacate nigra.
Bream, Silver	Chrysophrys natalensis.	Pike, Sea	Sphyraena jello.
Bream, River	Chrysophrys aestaurius.	Queen-fish	Chorinemus sancti-petri.
Bream, Black	Chrysophrys robinsoni.	Ribbon-fish	Trichuirus haumela.
Bream, Butter	Cyphosus fuscus..	Salmon	Sciaena aquila.
Bream, Bronze	Cantharus natalensis.	Salmon, Rock	Lutianus salmonoides.
Brusher	Sargus durbanensis.	Sand-fish	Platycephalus insidiator.
Cod, Rock*	Epinephilas Sp.	Shad	Pomatomus satatrix.
Concertina Fish	Drepane punctata.	Springer	Elops machnata.
Galjoen	Dipterodon capensis.	Snoek	Cybium lineolatum.
Garrick	Lichia amia.	Stonefish	Scorpis lithophilus.
Geelbek	Otolithus aequidens.	Surgeon	Acanthurus matoides.
Greyskin	Diagramma griseum.	Tasselfish	Umbrina dussumieri.
Grunter	Pristipoma eperculare.	Threadfin	Polynemus sextarius.
King-fish	Caranx hippos.	Wrasse	Chaerops natalensis.
Lady-fish	Abula conorhynchus.	Zebra	Sargus cervinus.
Moonfish	Trachynotus russellii.		
Mullet, Red	Upeneus natalensis.		
Mullet, Grey	Mugil capito.	And Clupeiod Sp., Herrings, Sardines, Anchovies etc.	
Mussel Cracker	Pagrus nigripinnis.		

* A large number of species of rock-cod, including the Black Sea Bass.

The species of edible fish generally taken by line-fishing vessels near shore include the following :—

Local Name.	*Scientific Name.*	*Local Name.*	*Scientific Name.*
Barbel	Galeichthys feliceps.	Leather Jacket	Bazlistes mitis.
Blueskin	Dentex natalensis.	Scavenger	Lethrinus scoparius.
Dagger-head	Pagrus pugicephalus.	Scotchman	Dentex praeorbitalis.
Dane	Chrysophrys dentatus.	Slinger	Chrysophrys puniceus.
Englishman	Chrysophrys anglicus.	Soldier	Dentex miles.
Grayskin	Lutianus griseus.	Wrasse, Deep Sea.	Cossyphus sp.

The edible species for which little or no market use is found include the following :—

Local Name.	*Scientific Name.*	*Local Name.*	*Scientific Name.*
Dog-fish	Scyllium sp.	Shark, Blackfin	Carcharias limbatus.
Eels, Rock*	Muraena.	Shark, Blue	Odontaspis tricuspidatus.
Hounds	Mustelus sp.	Shark, Tiger	Galeocerda rayneri.
Ray, Eagle	Dicerobatis eregoodoo.	Shark, Hammer-headed	Zygaena sp.
Ray, Marbled	Trygon uarnak.	Shark, Sand	Rhinobatus columnae.
Ray, Short Tail	Trygon sp.	Skate, Bonnet	Aetobatis narinari.
Saw-fish	Pristis sp.		
Shark, Black	Carcharias melanopterus.		

* Several species.

6. **Trout and Fresh Water Angling.**—Trout were first introduced some thirty years ago into the upper reaches of various streams flowing from the Drakensberg. As the result of suitable feeding and climatic conditions the fish have increased rapidly in numbers, and anglers now obtain excellent sport in the midland rivers of Natal. The Polela, Loteni, Bushman's, Mooi, and Little Mooi rivers are most frequented by anglers and provide the best sport, though a number of less accessible streams also carry good stocks of trout. The Mooi River, with its picturesque scenery and large stock of fish, is probably the best fishing resort in Natal. Some rivers, such as the Mooi and Little Mooi, contain only brown trout, while others, such as the Polela, have been stocked with the rainbow variety.

A trout-fishing licence for the season can be obtained at a cost of £1 (one pound) from the Principal Fisheries Officer, Durban, or from the magistrates of the various districts. The open season extends from 1st September to 30th April of the following year. A fully-equipped trout hatchery under a curator has been established at Estcourt.

In the lower reaches of almost all Natal rivers scale fish, barbel, and eels of large size are plentiful.

7. **Revenue and Expenditure.**—Statistical returns of the Natal Fisheries are not available prior to 1907, and then only on information furnished to a limited extent. As the importance of the work became fully evident, and facilities for securing statistical data were gained, records were instituted for comparative and other purposes.

So far as the figures and information are available, the following table may be taken as reflecting the position of the Natal Fisheries for a series of years :—

NATAL FISHERIES—REVENUE AND EXPENDITURE, 1919 TO 1924.

Particulars.	1919.	1920.	1921.	1922.	1923.	1924.
	£	£	£	£	£	£
Revenue	1,353	1,260	1,225	1,240	1,318	1,307
Expenditure	1,600	4,269*	4,472*	2,951†	1,400	1,070

* Including part cost of fisheries survey—£2,524.
